Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

(Fig. 1.)

(Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons, throws 25 feet high					...	£2 15
No. 13	„ 12	„	„ 30	„	...	3 5
No. 11	„ 16	„	„ 40	„	...	4 0
No. 12	„ 24	„	„ 45	„	...	5 0
No. 14	„ 30	„	„ 45	„	...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅛ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅛ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.

PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.

Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.

Fountains of every description erected; Rockwork, Grottoes, &c.

Hose Pipe of every kind for watering Gardens.

W. F. ROE (late FREEMAN ROE), Hydraulic Engineer, 70, Strand, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9*s.* to 18*s.*

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

S.B. Messrs. Veitch & Son.
C.1. Mr. Woolley, Gr. to H. B. Ker, Esq.

ROSES—CUT SPECIMENS, IN FIFTIES.

S.K. Mr. Mitchell, Piltdown, Maresfield.
S.B. Messrs. Paul & Son, Cheshunt.
C.1. Messrs. Lane, Berkhampstead.
C.2. Mr. Francis, F.H.S., Hertford.

ROSES—CUT SPECIMENS, IN TWENTY-FIVES.

S.B. Mr. Monro, Gr. to the Earl of Clarendon.
C.1. Mr. Terry, Gr. to Lady Giles Puller.
C.2. Mr. Busby, Gr. to J. Crawley, Esq., F.H.S.

VARIEGATED-LEAVED PELARGONIUMS.

L.S.

FUCHSIAS—IN TWELVES.

S.G. Mr. Gaines, F.H.S., Battersea.

VERBENAS—IN TWELVES.

S.K. Mr. Wetherall, Gr. to D. McNeill, Esq.
S.B. Mr. Higgs, Gr. to Mrs. Barchard, F.H.S.

EXTRA—PINKS.

S.K. Mr. Turner, F.H.S., Slough.
S.B. Mr. Bragg, Slough.
C.1. Messrs. Mitchell & Co., Brighton.

NEW PLANTS IN FLOWER.

S.K. Messrs. Veitch & Son, Exeter and Chelsea, for Ixora floribunda.
S.B. Messrs. Veitch & Son, for Fenzlia dianthiflora.
C.1. Messrs. Veitch & Son, for Phygelius capensis.

MISCELLANEOUS.

S.B. Mr. Woolley, Gr. to H. B. Ker, Esq., Cheshunt, for a collection of Gloxinias.
C.1. Messrs. Henderson, Wellington Nursery, St. John's Wood, for Fuchsia "Princess Royal."
C.1. Mr. Ingram, C.M.H.S., Gr. to her Majesty, at Frogmore, for a Hybrid Achimenes.
C.1. Messrs. Henderson, Wellington Nursery, for Hemiandra [pungens.
C.1. Mr. Barter, Gr. to J. T. Lenox, F.H.S., for 6 Variegated Pelargoniums.
C.2. Messrs. Henderson, for Stylidium scandens.
C.2. Mr. Bragg, Slough, for Sweet Williams in Pots.

SPLENDID NEW GRAPE.
BUSBY'S STOCKWOOD "GOLDEN HAMBURGH."

MESSRS. VEITCH AND SON have much pleasure in giving notice that they have made arrangements with Mr. Busby for the distribution of the Stock of the above truly valuable acquisition, which was exhibited at Chiswick on Wednesday last, and had the Large Silver Medal awarded it; see Report of the Show in this paper.

Messrs. VEITCH are now taking orders, which will be executed strictly in the rotation in which they are received, and the plants sent out as soon as the stock is sufficiently increased. Price 21s. each.—Exotic Nursery, Chelsea, July 14.

NEW PLANTS.

HENRY GROOM, Clapham Rise, near London, by appointment FLORIST TO HER MAJESTY, begs to offer the following fine and new plants:—

	Each—s. d.		Each—s. d.
Fuchsia Queen Victoria	7 6	Pentstemon Wrightii ...	5 0
" Prince Albert...	7 6	Weigela amabilis	2 6
Heliotrope Beauty of the Boudoir...	1 6	Cyclamen Atkinsi ...	10 6
Verbena Mrs. Woodroffe	1 0	" hungaricum ...	5 0
" Wonderful ...	2 6	" repandum ...	5 0
" Blue Beard ...	3 6	Berberis Darwini 1s. to	3 6
Calceolaria Purity... ...	3 6	Cerasus ilicifolia, 2s. 6d. to	5 0
Salvia grandiflora Skinneri	5 0	Tritonia aurea...	1 6
Salvia Gesneræflora ...	1 6	Rhododendron Edgworthii 5s. to	10 6
Lysimachia Leschenaultia	2 0	" campylocarpum, 5s. to	10 6
Deutzia crenata	2 6	" niveum ... 5s. to	7 6
" gracilis... 1s. to	2 6	" glaucum ... 1s. 6d. to	2 6
Impatiens Hookeri ...	5 0	Hippeastrum aulicum, 3s. 6d. and	5 0
Auracaria Lindleyana ...	105 0	Vallota purpurea, 2s 6d. &	3 6

Clapham Rise, July 14.

CHOICE NEW AND RARE PLANTS OF THIS SEASON
AT REDUCED PRICES.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, is prepared to send out nice healthy plants of the following new novelties at the reduced prices as annexed.

FUCHSIAS.—Story's Mrs. Story, 3s. 6d.; Queen Victoria, 3s. 6d.; Water Nymph, 3s. 6d.; Empress Eugenie, 3s. 6d.; Lady of the Lake, 3s. 6d.; Snowdrop, 3s. 6d.; Banks' Beauty of the Bower, 2s. 6d.; Prince Albert, 3s. 6d.; Maid of Kent, 3s. 6d.; Climax, 2s. 6d.; Grand Sultan, 2s. 6d.; Omer Pasha, 2s. 6d.; Smith's Omer Pasha, 2s. 6d.; Violæflora pleno, 3s. 6d. each, or 30s. per dozen post free where two or more are ordered.

	Each.—s. d.		Each.—s. d.
Hydrangea hortensis flore pleno	5 6	Phlox omniflora compacta, dwarf white	2 6
Begonia oppuleefolia ...	2 6	Calceolaria Purity, fine white	3 6
Tydea Warczewiczi, new and fine stove plant ...	5 6	" Wildfire ...	3 6
Geranium Pretty Polly, fine bedding variety	3 6	" Maggiore ...	3 6
		" Vezzossa ...	3 6
		Petunia Singularity, Smith's	2 6

Early orders are respectfully solicited for the above, which will be executed in rotation as received, the stock of some of the varieties being rather limited. A remittance requested to accompany all orders, payable at Marsden, Lancashire, unless a reference is given.

Every article in the Nursery and Florist Trade on the lowest remunerative terms, also a choice collection of large flowered and Pompone Chrysanthemums, new varieties. Strong bushy plants, ready to go into blooming pots, 6s. to 9s. per dozen.

The Gardeners' Chronicle.

SATURDAY, JULY 14, 1855.

LAST Wednesday's EXHIBITION at CHISWICK was held in a perfect downpour of rain, which very much excluded both visitors and exhibitors. Nevertheless the show of fruit, upon which the prizes of the day were concentrated, was extremely fine. Above 250 dishes of excellent produce, and many young trees in pots, well loaded with fruit, graced the tables; the latter came from the Duke of NORFOLK's garden at Arundel, and from Messrs. LANE and SON, who are becoming worthy rivals of Mr. RIVERS in the orchard house line. The Plums particularly attracted attention, owing to the beautiful condition in which they were shown from Frogmore and Arundel. DENYER's Victoria, a large reddish sort with a delicate bloom; the Goliath, Green Gage, Jefferson, and Washington varieties will never be seen in such condition unless under glass.

Grapes, too, were in great force. From Trentham came most admirable bunches of the Black Hamburgh and Mill Hill Black Hamburgh, sufficiently showing that the two sorts are very far from being identical. The best coloured bunches, however, appeared to us to be some very remarkable ones from the garden of Mr. WILLIAM HERBERT, of Clapham Common.

Fine Pines were exhibited in long lines of yellow and brown, and in every case did credit to the growers. Among them were two striking Black Princes from Temple Newsome, and a Providence weighing 12 lbs. 3 oz. from Dowlais. It is a pity such fine looking things should not be better worth eating.

The only novelties which we observed were a white Grape, called the Stockwood Golden Hamburgh, and a Strawberry named Omer Pacha. Both were excellent in quality as well as attractive in appearance. The Strawberry seemed to have a little of the flavour of the Alpine. The Grape had been raised by Mr BUSBY *from the seed of the Black Hamburgh*, which it entirely resembled in form; but it had the colour of a white Muscadine, and was quite as good as the Black Hamburgh itself. Undoubtedly it is a real acquisition.

We were greatly disappointed with Ferns and Lycopods, which might have been produced in

abundance, and would have greatly embellished the fruit tables. What did appear were excellent, especially the Lycopods from Mrs. ELLIS, of Hoddesdon.

Plants with fine foliage were also produced in inconsiderable quantity, the only exhibitors being Messrs. VEITCH, ROLLISSON, HENDERSON, and JACKSON.

It would seem as if public taste was still in great want of refinement. The negroes of the Gold Coast are said to admire nothing so much as the most tawdry Manchester goods blotched with the most brilliant reds and yellows and blues; the delicate tracery of an Indian loom is looked upon with contempt. So it is with us and our plants. Unless a flower is as glaring as a Poppy or a Pelargonium it is neglected, and no sale can be found for it; hence the nurserymen, very properly, direct their attention to fine flaunting sorts—for it is their business to please their customers. And yet we appeal to all persons of good taste who were present on Wednesday, whether the most beautiful by far, in the true sense of the word beauty, were not such plants as the delicate green flowered *Dendrochilum filiforme*, or the noble forms of exotic vegetation not in flower, or even the humble but exquisitely marked *Fenzlia* produced by Messrs. Veitch.

We should like to see an exhibition on a grand scale from which flowers of all kinds were excluded, but to which fruits should be admissible. Could such an object be accomplished, and the same skill in grouping be evinced as in the case of flowers, we suspect that public opinion would be very considerably altered as to what constitutes a really beautiful object in the vegetable world.

AN article on planting in the last number of the "Quarterly Review" was lately selected by some of our correspondents as the ground of certain criticisms upon the construction of LIVE FENCES. Want of space, and, let us add, the tone of some of the communications, led to a discontinuance of the discussion, in which, indeed, we had taken no part. The approach, however, of the time when Quickset hedges may be planted in favourable situations, tempts us to revive the question, especially since it is evident that by some at least it has been totally misunderstood.

In speaking of fences the reviewer uses these words:—"In one place a rough stone dyke will be most available, in another a bank of turf; here a dyke planted with Furze, there a Quickset hedge. If the last be selected it will be rendered more efficacious though less ornamental by mixing Beeches with the Thorns, as these trees when young retain their withered leaves until spring, affording shelter to the plantation during the budding season, which is the period when their services are most needed. The young Thorns, before being set, should be cut down to about 4 inches above the crown of the root; but the Beeches must be left whole. Both should be planted about 7 inches apart, in the proportion of two Thorns to one Beech. After the young plants have made two years' wood, it is advisable to cut them all down to about 9 inches of the surface, an operation which will have the effect of making them throw out numerous side branches."

This sounds so like an echo of a chapter in BROWN'S "Forester," that we are not surprised to find it mistaken for an extract from that useful book. Such, however, is not the case; the words are the reviewer's own, although imitated from BROWN, and we must add spoiled in the operation.

What Mr. BROWN says is that a certain mixture of Thorns and Beeches, "upon high situations with a light soil" forms a better fence than Thorns alone, because in such places Thorns are "apt to die early," whereas when mixed with Beech "the fence is much improved both in health and appearance." The reviewer, on the other hand, recommends the mixture under all circumstances, which is by no means what either BROWN or any other practical man would advise. In one respect both the reviewer and the reviewed agree, namely in recommending the Thorns to be cut down to the length of 4 inches before being planted. Both these practices, that is to say forming a hedge of mixed materials, and cutting down Thorns when planted, have been objected to, as being contrary to sound gardening. They must be considered separately.

We hold it to be incontrovertible that all hedges should be formed from one kind of plant alone, *when land will permit it;* a mixed hedge is exceptional. If soil is good enough to bear strong Whitethorn no better plant can be employed, as is sufficiently shown by the noble fences to be met with in all the richer parts of the country. Mr. BROWN says nothing to the contrary; but he says that in poor light land, such as is often selected for plantations, *where the Whitethorn will not thrive*, it is good to add one-third of Beech. The first object is to get a hedge of some sort, the second is to have as good a one as circumstances will permit. The question, therefore, is whether Beech is improved by adding Whitethorn, or Whitethorn by adding Beech. Here, as in all things, experience is the only sure guide; but experience is unfortunately contradictory. Mr. BROWN finds the mixture advantageous in Scotland; we know it to be productive of no advantage in our eastern counties, where mixed hedgerows are always full of gaps and blemishes, but where admirable fences may be formed from mere Beech or from mere Whitethorn. It is, indeed, but reasonable to suppose that a line of trees all alike will be more uniform in every respect than if it consists of several sorts. Whitethorn in poor sandy land will not grow with the necessary vigour, if at all. Will Beech improve the quality of the land? Surely not. But it is urged that the Whitethorn refuses to grow on such land, not because of its poorness, but because of its bleakness, and that the Beech offers some shelter; that is a better reason for the mixture of the two trees. But we greatly doubt whether under such circumstances it is not as well to confine the hedge to the Beech alone. If the Thorns are in bad land they cannot grow fast enough to improve the resisting force of the Beech; if they are in good land they are best by themselves. Nor can we call to mind any place, however bleak, in which the Thorn fails if the land suits it. It is one of the hardiest of all trees. Mr. BROWN, however, entertains a different opinion, which is doubtless entitled to great respect. Nevertheless we venture to recommend the point to his further consideration. At all events he has nowhere advised a mixture of Thorns and Beech in the unreserved manner expressed in the "Quarterly Review."

The second branch of this discussion is whether Thorns, when first planted, should be cut down or not. The common plan is to cut them down; Mr. BROWN advocates the practice; the reviewer echoes the advice, and we take their side under certain circumstances. There is, indeed, no doubt that beautiful hedges have been obtained from Thorns headed down before being planted; it is also certain that hedges not so formed will often present dead spaces. There are two instances within a short distance of where we are writing, one of which is a hedge made of Thorns 3 to 4 feet high when planted, while the other was headed down. The latter is for its age much the best; it was formed in September when the leaves were on the Thorns, and it never had a vacant space. The other was planted in winter, when the leaves were off, and several places in it afterwards required mending. The explanation seems to be simple enough, although some of the unpublished communications lying before us treat it as a wonderful mystery. The Whitethorn has coarse roots with little fibre, and they send out fresh rootlets, with unwillingness when transplanted; so that if any top is left ready to produce leaves the plants are exhausted by the nascent foliage before the roots can act upon the soil. On the other hand, if Thorns are headed down when planted time is given for the development of fresh rootlets before any leaves can come, and then, when the foliage does begin to act upon the system, the roots are already in activity and effectually prevent exhaustion.

It is evident that this must be the true explanation of the practice of heading down Thorns so generally practised and so highly recommended. But is it always necessary? Surely not. Everything turns upon whether roots can be formed soon enough to feed the leaves when they appear. If the roots are already fibrous, have been carefully preserved, or by repeated previous transplantation are in such a state that the plants can be removed without injury to them, then to head the Whitethorn down is a needless waste of force and of time. It is, however, almost always necessary to head back this kind of fence eventually because the buds on the lower part of the stem have a great tendency to perish, the effect of which is to prevent the production of the undergrowth required to give the hedge closeness near the ground. And such being the case it is the best practice to head down at first, except in those instances where an immediate barrier is wanted.

We should have thought that this was a very plain matter. Let us hope that it will be considered so in future.

VEGETABLE PATHOLOGY.—No. LXXX.

334. PETALOMANIA (*Multiplication of Petals*).—In almost every plant there is a normal number of petals, from which, however, there are occasional deviations either by suppression or multiplication. In some genera the number of petals is far more inconstant and uncertain than in others, especially where the petals and stamens gradually pass into each other. In such cases, however, though the ordinary number of stamens and pistils may be deranged, there is seldom any decided abortion or imperfection in those organs. This however, is far from being the case where the petals are multiplied to excess, as in such instances the proper organs of fructification may be so frequently obliterated as to make the collection of seed a work of great difficulty. In all such cases the multiplication of the petals is more perfect, in proportion as the soil is, within certain limits, generous; a barren soil will cause a reversion to the original condition, and the variety may thus be rendered worthless. Pistils, however, may be produced where there is no trace of stamens, but these may be impregnated from fertile plants, and new varieties arise. Where the sterility is perfect propagation can only take place by cuttings, but in this way a variety may be preserved almost indefinitely. Seed, however, from double flowers does not necessarily produce flowers of equal merit in the eyes of the florist, any more than seed from apetalous flowers, such as the Sweet William* (described *Gard. Chron.* 1851, p. 550), does not necessarily reproduce a single similar plant amongst hundreds of seedlings. Where seedlings are absolutely necessary, or where they are much wanted, the surest way of obtaining them is by withholding all forcing nutriment. In some cases seed may be obtained simply from allowing the plant to run itself out. In the Balsam, for instance, though the first flowers of the finest varieties produce scarcely a trace of fruit, after a time, when the plant is a little exhausted, feebler flowers will be produced, from which seed may be obtained. In this case propagation could not be maintained very long by mere cuttings.

335. Though the greater part of a tree may produce normal flowers, a few branches, the Midsummer shoots, for instance, of the Pear, may produce double and sterile flowers. These are generally so worthless that no attempt is made to propagate them; but it is very possible, if there were any merit in the production, that the qualities might be propagated by cuttings.

336. As in the endogens mentioned in No. 334, the petals also of exogens occasionally assume characters quite at variance with the genera to which they belong. This is especially the case in irregular flowers, as in Labiates and Linariads. The terminal flowers of such plants as Stachys not unfrequently assume a salver-like form, quite at variance with their normal aspect; a remarkable modification of the flowers of the common Foxglove attended by multiplication is figured *Gard. Chron.* 1850, p. 435; a regular corolla in Calceolaria appears in the same volume, p. 389; similar instances are not very unfrequent in terrestrial Orchids; and in some other flowers in which one or more of the petals have a spur the change is still more singular in appearance, as in the pelorioid varieties of Antirrhinum and Linaria. Such flowers may be scattered amongst others of the ordinary structure, but sometimes every flower in the spike is pelorioid, and the plant will then retain its characters when cultivated.

337. ANTHEROMANIA (*Multiplication of Stamens*).—The number of stamens is generally dependent on that of the sepals and petals, and if they are increased within certain limits the stamens are increased too. In irregular flowers, as in Orchids, the addition of one or more anthers may derange the whole structure of the flower. Additional stamens may, however, be produced without any accompanying increase of petals, and where the structure is normal, the practical effect to the cultivator is immaterial.† The transition between stamens and petals is so gradual in many cases, as for instance in the common Water Lily, that it may not always be possible to say whether the multiplication in a double flower is due to mere repetition of petals, or to transformation of stamens. Traces of anthers may sometimes be seen on the side of the petaloid expansions, indicating what the nature of the transformation is, or petals and stamens may be multiplied simultaneously. In such cases if anthers are formed there will seldom be any fertile pollen, and so much nutriment is diverted to the multiplied and hypertrophied organs that the pistil if formed will generally be barren. In diœcious plants normal stamens are occasionally produced in the female flowers, and thus fertile seed may be formed even in such plants without the presence of plants of both sexes. That seed capable of vegetation is occasionally produced without the presence of pollen was shown long since by Spallanzani, in the case of Hemp, observations which are confirmed by the notorious instance of Cœlebogyne.

M. J. B.

NEW GARDEN FERNS.—No. II.

4. PYCNOPTERIS, T. M.

Sori medial, circular, very large, irregularly bi- tri- or quadri-serial near the costa, indusiate. *Indusium* roundish reniform. *Veins* forked; venules elongate, parallel-curved, free, terminating near the margin in club-shaped apices; the lowest anterior and posterior ones (sometimes more, or all) in each fascicle soriferous.

PYCNOPTERIS SIEBOLDI, T. M. in Hort. Van Houtte (Aspidium Sieboldi, Van Houtte, Cat.; Lastrea Sieboldi, T. M. in Herb).

Fronds leathery, broad, pinnate, smooth; pinnæ few, obliquely oblong-lanceolate, falcate, irregularly serrate; the lowest stalked and unequally cordate at the base, the upper sessile

* The seed of this variety was largely propagated without producing a single apetalous plant.

† It is often said in such considerations that every leaf has a bud in its axil normally; such buds are actually developed into branches in the varieties of Lupine and Foxglove mentioned above, ¶ 331. Wherever a bundle of vessels passes from the axis, buds or new organs may be expected, though what is the mysterious connection is quite inexplicable, since the bud in its origin may have no connection at first with the vascular bundle, and two organs or buds may occasionally be produced instead of one.

and decurrent; sori large, numerous, irregularly bi-tri-serial; stipes scaly below; fronds adherent.

A very remarkable Fern, so distinct-looking, and so different in habit from the other free-veined Aspidieæ, that it is proposed to separate it from them. It is of bold and striking aspect, full deep green in colour, and having a beauty distinct from the delicacy usually found among Ferns, which makes it valuable for grouping. It grows a foot or more high, the leafy part of the fronds as broad as long, and consisting of about two to four pairs of very thick leathery pinnæ, and a larger terminal one. The pinnæ of the barren fronds are from 4 to 6 inches long, oblong-lanceolate, falcate, acuminate, and somewhat undulated, borne on a stipes 3 or 4 inches long, which is very stout at the base, and there clothed with long narrow hair-pointed scales. The fertile fronds, which bear sori throughout, are elevated on longer stipes than the barren ones, and are besides in a slight degree contracted, the pinnæ in the most perfect fronds being about an inch in width, whilst in

the barren ones they are an inch and three quarters wide. The sori, which are very large, consist of a great crowd of black spore-cases, seated on a somewhat elevated receptacle. The vernation is peculiar. The rhizome or caudex, to which the fronds are adherent, grows quite erect, and the apex is developed beyond the base of the perfect fronds, so as to show two or three series of incipient fronds, having a somewhat decussate arrangement. This Fern, as we learn from M. Van Houtte, from whose nursery at Ghent it was introduced to our gardens in 1852, was obtained by him from Dr. Von Siebold, and is a native of Japan or of China. It grows well in a greenhouse, but is quite hardy, having survived the winter of 1854-5 without the least injury, in an exposed case in Mr. Ward's garden at Clapham, and in the open air without any protection, in the garden of A. East, Esq., of Blackheath, Kent. It may be raised with much facility from the spores. The genus is related to Lastrea in its fructification, and to Polystichum in its venation. The veins, however, are remarkable for their club-shaped apices, and are quite like those of Scolopendrium; and the large multiserial sori on elevated receptacles are discordant with Lastrea, as are the distinct and partially contracted fertile fronds. The name is from *pycnos*, thick, and *pteris*, a fern.

5. DAVALLIA DISSECTA, J. Smith MS.; Gard. Mag. Bot., iii., 325.

Fronds slender, glabrous, triangular, tripinnate, sub-membranaceous; pinnæ triangularly elongate, acuminate, the lower ones unequal-sided; ultimate pinnules oblong, deeply pinnatifid, with linear entire or bifid segments; rachis and midribs winged; sori occupying the apex of the segments, often with an exterior tooth; involucres linear cup-shaped; rhizome elongated scandent, densely scaly, with subulate fimbriate scales; fronds articulated.

A very elegant stove Fern, but also growing in a close atmosphere without the influence of strong heat. The fronds are of an elegant bright green, and are very much

divided; they are from a foot to a foot and a half long; in outline triangular, or somewhat pentangular from the greater development of the posterior pinnules on the lower pinnæ; the other pinnæ are narrow, elongate, triangular acuminate; both the primary and secondary pinnules are oblong; the segments narrow, linear, entire, or with a shallow notch at the apex. The sori are entirely sunk in the points of the lobes, and have a small projecting tooth occasionally on the exterior side, rarely on the inner side also; the involucres are linear cup-shaped. This Fern, which is a native of Java, was introduced in 1849 by Messrs. Rollisson, of Tooting. It is one of the most elegant of the very beautiful genus Davallia, and is besides very easily cultivated.

6. PHLEBODIUM MULTISERIALE, Moore and Houlston, in Gen. and Sp. of Cult. Ferns, ined.

Fronds ample, sub-pinnate, glabrous, green not glaucous; segments broad, lanceolate-acuminate, dilated at the base, entire; sori in several series on each side the midvein; rhizome shaggy, with light brown scales; fronds articulated.

A noble Fern with the general habit and aspect of Phlebodium aureum, but differing in the greater breadth of its segments, in the total absence of the striking blue-green colour which pervades P. aureum, and in the numerous small sori scattered in four or five series over the whole surface of the segments. The fronds are from 2 to 4 feet long, pinnatifid, or pinnate at the base; the segments lanceolate, acuminate, 8 to 10 inches long, and nearly 2 inches broad, the sinus narrow and rounded, not broad and oblique, as in aureum. The fructification either occupies the upper part of the frond, or sometimes occurs over the whole surface of distinct fronds. The plant is a native of South America, and was introduced to Kew in 1850; more recently it has been obtained from Demerara. It is a desirable and effective species among the bold-looking Ferns of ample size. *T. M.*

Home Correspondence.

Celery.—I am induced to submit the following hints on the cultivation of Celery, which I practised very successfully many years in the West Indies, and which, I trust, may be found useful to those who may feel inclined to adopt my system. It is as follows:—Finding the usual mode of planting Celery in trenches 5 feet apart, and "earthing up" laborious and inconvenient, I was led, after making several experiments, to adopt a very simple plan by which much labour and ground were saved by planting the plants upon well manured ground 14 inches apart in the rows, and each row 14 inches from each other, in the quincunx order. When they were grown of sufficient length I introduced the leaves, after stripping off the small under ones, into bamboos cut about 12 inches long—the length they admit of between joint and joint, the diameter of each being about 3 inches—and in 11 days I have generally had them beautifully blanched clean and fit for the table. Since my return to England in 1849, seeing some hollow tiles 12 inches, and of the same diameter as the bamboos before-mentioned, used for draining land, it occurred to me that a similar method might be practised here; consequently I had a piece of ground well manured, dug, the clods being well broken, and planted in rows and distances as before detailed. When the leaves were long enough, the small ones being pulled off, I gathered the rest together in my hand, and put them through the tiles, keeping the surface of the ground clean by occasional hoeing; the plants made rapid progress, and after a time I put some half tiles on the top of those first placed, thrusting a stick inside both into the ground, to prevent the wind from blowing them down, and in 34 days the Celery was well blanched. On the 15th December last year I cut one head, that had a second tile about 10 inches long over the first, which measured 3 feet long and 10 inches in circumference, exceedingly well blanched. Previous to severe weather coming I put Peas haulm, straw, or dry litter between the tiles, with clean straw or dry Fern over the whole to protect the plants from frost. It will be an improvement to have the tiles so constructed as to admit of what may be termed a collar on the under and upper tile, so as to fit on each other similar to a turned wooden box, which will exclude the air at their junction; and instead of sticks, as before mentioned, I would recommend wires of the thickness of a common goose quill, 30 inches long, or thereabouts, formed similar to a surveyor's arrow, to be substituted. Should you feel disposed to give my method publicity, further improvements may be made by experimentalists, or even as it is practised by myself, it will be found very useful. *James Waters, the Rectory, Penshaw, Fence Houses, Durham.*

Ineffectual Puddling.—Would you or any of your correspondents be kind enough to give me any information in my present difficulty. This time last year I began to form an ornamental pool in front of my house below the lawn; the subsoil is quite a gravel, extending to a great depth, so much so that the undertaker considered that no bottom at the under side of the pool could be obtained upon which to found a puddle wall in the centre of the embankment; he, therefore, determined to line the whole interior with puddled clay. After three unsuccessful attempts to retain the water (the puddle now being 2 feet deep and well beaten both at the bottom and at the sides) we have covered it all with about 2 inches of soil; still the water will not stand above 9 inches deep until it runs out at the lower part. The clay is of a very fine nature, and the water from its own weight must, we consider, penetrate through it. The intended depth is about 4 feet at the deepest part or lowest side. I am now quite at a loss what to do with it, and would feel greatly obliged, if through your columns you could afford any information upon the subject. *J. J.*

Gardeners' Royal Benevolent Institution.—I have taken an early interest in the formation of the Gardeners' Benevolent Institution, and watched year by year its successful progress with regard to its pecuniary means with much satisfaction, but I cannot say I have always approved of every act of its administration. For instance, the management of elections for pensioners, through the system adopted by influential subscribers, is open to much censure as being anything but just or fair. The last election affords a striking example of the evils of the system of canvassing, or, to use a stronger and more modern term, of favouritism. We will see then how this favouritism, or patronage, has acted to the detriment of those candidates whose claims were such as would naturally entitle them to the consideration of subscribers, in preference to those who have never endeavoured to contribute one farthing to the support of the institution. At the last election there were 17 candidates, of whom three were to be elected pensioners; the two first on the list were elected, one on the eleventh, the other on the ninth application; but the third, who was elected on the second application, is a palpable instance of the system complained of, and I will endeavour to show the great body of subscribers that, by sending their polling papers to the influential man, they are unintentionally the cause of great injury to other and more deserving candidates. Take, for instance, the case of poor Ann Arnold, whose husband subscribed eight years; of Joseph Jeffrey, who subscribed eight years, and of George Kidd, who subscribed nine years to the institution, and from this evidence, it must be apparent to even the most casual observer that the fact of having been a subscriber, so far from giving a candidate a prior claim to the notice and favourable consideration of voters has rather, from the favouritism exercised, been productive of opposite results. There is no reasonable person who will not admit the injurious consequences of this system of patronage; we have unfortunately seen far too much of it already in various quarters, and we need only take the case of the Literary Fund to see the full extent of its evil effects on every part of such institutions. After so long and useful a career every one would regret to see the Gardeners' Benevolent Institution in such a position, or indeed anything approximating to it, and I address you now solely with the desire of correcting this abuse. *An Old Subscriber to the Institution, City, July* 11.

Training Trees on Walls.—In your leading article a few numbers back, you gave us a dissertation upon the structure of garden walls, with the view of ascertaining the most suitable for the purpose of training fruit trees, &c., on. Your observations in that article, and the conclusion to which they led, met my entire concurrence. Supposing such walls are constructed, the next question is, how best to cover them with trees? It has often appeared to me something unnatural in training wall trees to divide them low—say 1 foot, or 1½ feet from the ground, as those commonly called dwarfs are usually managed; I am of opinion that it would be more in accordance with nature were the trees trained with a stem, say from 4 to 6 feet high, and radiated so as to cover the wall to very near the ground. I allude chiefly to Peach and Nectarine trees, and am of opinion, moreover, that the durability of the trees is prolonged by such a mode of training. I remember a remarkable instance in proof of my opinion at the seat of an ancient family in the vicinity of Derby, where there is a very good garden, a walled-in oblong square, with a walled-in compartment at the east end, which served as a Melon ground, &c.; there were trees (Peach and Nectarine) planted on the exterior south wall, dwarf and standard alternately; in the Melon ground compartment the south wall was planted with standards only, and radiated. In the days when I knew them intimately (now many years ago), the standards on the exterior south wall had all been cut away to give place to the dwarfs, and these had nearly become naked sticks, with only a little bearing wood near the top of the wall. The radiated standards, on the contrary, were fine healthy, vigorous, fruitful trees, and covering the entire wall from top to bottom. The case impressed me so then that I made it a subject of remark to a friend (the late Mr. Ayres, of Kedleston), who told me he was the person who planted the trees, and got laughed at and ridiculed by his neighbours about his radiating scheme; he was an intelligent, good gardener, and was surprised that I (then a youth) should have adopted the notion he had so successfully proved. I have practically proved it since, and feel quite confirmed in my opinion that the radiating system is most natural and most preferable. *Quercus.*

How to prevent Leaf-burning.—For several years I have been annoyed by the scorching of the leaves in my vinery from the intense heat of the sun. I saw it stated that Hartley's Patent Rough Plate Glass is admirably adapted for vineries; I therefore covered the inside of the glass of my vinery with thin whitewash. It has answered perfectly. The vines and the fruit are in a very healthy condition; and a few plants that stand about have assumed an appearance of vigour and luxuriance which I never saw before. I keep the floor moist, but of course avoid syringing, or it would wash off the whiting. I strongly recommend this, particularly to amateurs, for conservatories during the present glaring weather. A friend has suggested that some paste made of flour would be better, and adhere longer to the glass. *G. L., Cambridge.*

Nidification of the Talegalla.—Your correspondent "G. W. L." seems to doubt the truth of the passage in the Zoological Society's Guide Book having reference to the nidification of the Brush Turkey (Talegalla Lathami, of Gould), whose manner of reproduction as there stated he thinks will not bear "investigating by the ordinary process of analogical reasoning." Now I have

no intention of either justifying or defending the aforesaid Guide Book, which is, I know, not free from error on other subjects; the latter, however, have nothing to do with the point in question. Having myself lately visited the Society's gardens I particularly noticed the Talegalla, whose strong and powerful legs seem well adapted for throwing up or forming mounds of leaves, earth, or other matter. This fact must have been apparent even to "G. W. L." himself. We will suppose it then to be a settled point that it is capable of collecting or throwing up enormous mounds of fermentable matter, more especially when we are informed from a very creditable source that the mound is not the result of the labours of a single pair, but is produced by the combined efforts of many. This mound or nest, when completed, is then in itself nothing more than a self-acting incubator, in which the bird deposits its eggs, at the depth (we may premise) which nature teaches it will be proper to secure a sufficient heat to hatch them. Thus far, at least, the nidification of this singular bird is plain and probable enough. But we now come to the chief point in dispute, viz., the possibility of a young bird being able to extricate himself from a mound of this description, or as "G. W. L." puts it, "with its tender feet and legs, scratching its way out from under an enormous mass of fermenting leaves and earth." Comment on (I suppose the absurdity of) this subject your correspondent deems needless, and asks the question "does any one in their senses believe this?" Now, I myself adhere to the statement set forth in the Guide Book. One thing, at least, is certain, viz., if the eggs are deposited, and consequently hatched, in the mound, as we have every reason to believe they are, nature must have provided the chick with some means or other to extricate itself from the nest, otherwise the ends of natural reproduction would be defeated. That the old birds may assist the young to escape from their confinement is probable, but still more so that nature has provided the young bird with a more certain means of liberation in the strong and well developed feet with which it is furnished. And may not the same instinct that teaches the callow and unfledged nestling to gape for its food have taught the young Talegalla, in like manner, with the aid of its powerful feet, to work its way to both food and day. Speaking of "analogous reasoning," take for instance the nidification of the mound-making Megapoda Tumulus, which, although considerably smaller than the Talegalla, constructs a mound of earth and leaves, and deposits its eggs in like manner. Again, why should it be considered so preposterous for a bird whose structure is admirably adapted for its mode of life, to begin that life, as the case may be, by either swimming or scratching? Look, for instance, at the conduct of some of our water birds; ere they are scarcely an hour old, we see them apparently both experienced and skilful swimmers. Why then may not the Brush Turkey enter life not by swimming, as with the water fowl, but by a process infinitely more congenial to its general habits? For myself, I can see no great difficulty in the matter, or any impediment offered by a foot or two of leaves and earth, beyond what may be easily removed by the exertions of a young and vigorous bird like the one in question. Difficulties, however, may exist, and insurmountable obstacles present themselves that I am not aware of. But, in conclusion, I must own candidly that I do not perceive either the one or the other. For further and full information on this subject, let me refer your correspondent to the excellent and able work on the "Birds of Australia," by our eminent ornithologist Gould, who has spent several years (two of them personally on the spot), in investigating, collecting, and classing the hitherto almost unknown birds of that extensive country. *J. J., Strathfieldsaye.*

New Garden Pots (see p. 453).—I find in looking over last week's impression that the engraver has made a slight mistake in the form of my blanching pot. In the engraving the hole is made to go through the pot, instead of which it is made only partly through, from which about three smaller holes radiate to the outside of the pot. This provision is made with the view of excluding light, and as the whole surface is entire on the outside, for whatever purpose the pot may be used no wet can possibly find its way into the interior amongst the plants, &c. When these pots are used in growing summer plants this subterraneous mode of drainage will not only be found to be perfect, but where the pots are placed on the ground entirely prevent the ingress of worms, &c. *George Fry.*

Supply of Water to Wells, &c.—The shortness of the stock of water in the water-bearing strata is now becoming a serious question. Reference to the rain-guage guides us to the cause, the remedy is beyond our reach; though the inconvenience suffered in some places may in some measure be met, especially in supply to wells. The rain-guage for the 19 months ending with April last gives us rather under the average for 12 months. Wells in the chalk and other strata showed at the beginning of May an unusual depression, at a season when on the average the subterranean stock of water is at its height. In May we had the average of rain, in June above the average, which told very slightly on the supply. For the two next months it will require an extraordinary rain fall to increase the supply in the least degree. The amount of evaporation and the quantity taken up by vegetation will prevent this. Dalton's rain-guage, as used by Mr. Dickinson, and constructed to register the amount of rain percolating 3 feet of soil, shows that during the six summer months from April to September inclusive, only 0.57 parts of an inch of an average rain fall of 12.29 inches is so registered. It is shown by a table in a paper read by Mr. Dickinson before the Royal Society in 1851, that in the month of July in 15 years there fell 36 03 inches of rain, of which only 0.34 was registered by Dalton's guage; in the same period in August of 36.00 inches only 0.29, and in September of 36.76 2.95, of which 1.50 was registered in 1839 and 1.30 in 1842. Thus, till the end of September, we have no reason to calculate upon any percolation of rain to increase the subterranean stock of water; we must, therefore, make the best of that we now have. It must be borne in mind that all subterranean water lies at a certain inclination in the stratum in which it is held, the dip of this inclination being towards the vent or outfall; that the angle described by a line indicating its surface increases as the stratum through which the water percolates is more or less retentive; and that the alternation of level caused by the infiltration of rain is represented by a line fixed at the vent, and rising at an angle increasing with the distance from the vent. When a well fails by the depression of this line, the obvious remedy is to deepen the well; if it becomes perfectly dry, this is the only course. But if it should only fail after a certain amount of exhaustion, and the water should rise again to a certain level, however slowly, it will often be better to increase the diameter of the bottom of the well if the nature of the stratum into which it is sunk will permit; more fissures and a greater surface of infiltration will be spread, and a subterranean reservoir formed, whence a larger supply at one time might be drawn. It is often dangerous to deepen a well, lest a clay below the porous stratum should be pierced, and so expose the water to contact with substances such as iron pyrites, &c., which impart a new chemical character to the water, and impregnate it with deleterious matter. There is another expedient, namely, boring, which seldom effects a good commensurate with the expense and trouble. We are not speaking of Artesian wells, which can only be had under certain geological conditions. Thousands of pounds have been thrown away on experiments which never ought to have been made, and which have been suggested by ignorant or interested parties, who have persuaded the owners of wells to try to make their wells Artesian, or to bore in the hope of getting the water to rise in wells in which the water has failed; but no boring into a water-bearing stratum, except it be covered by a stratum impervious to water, will cause the water to rise one inch. It is true that the supply to wells in chalk and other such strata may be increased by boring, but generally a deepening of the shaft a few feet will be better than the deepest boring, and in no case will boring supply water to a well that has become dry. The failure is simply because the water level (as now) has become depressed below its usual alternation. I could name wells in the chalk where this alternation is 100 feet in perpendicular height, yet there is water below, for in no case have I found the water in the chalk to stand at a less inclination than 10 feet in the mile above the vent or outfall. Suppose a mass of chalk resting on a clay at a dead level, at one mile from the vent, spring, or river, there would be 10 feet of chalk charged with free water in its cracks and fissures. The adjustment of the water level in all pervious or porous strata is a most beautiful exemplification of the law of hydrostatics, regulated by the friction or amount of resistance presented by the stratum through which the water flows to its vent in springs and rivers—hence the inclined line; without this the springs and rivers would not, as now, be virtually perennial, for the whole stratum would be drained in seasons of drought, before the period of replenishment arrived. Hence, too, the security to wells, and the almost certainty that when they fail there is still water beneath. *James O. Clutterbuck, Vicarage, Long Wittenham, Abingdon.*

Wasps, &c.—Allow me to acquaint the gardening world that I have during May and June at a penny and a halfpenny got during May 305 wasps and in June the large number of 1778, making a total of 2083 large wasps, mostly Queens, during the last two months. During May they were mostly found on the Gooseberry bushes, and during June upon the Snowberry. My gardener killed about 40 or 50 upon a Snowberry bush in my garden. I am of opinion that the swarm we had must have come from some foreign clime. I remember, when in Berkshire in the summer of 1794, that my Aunt Lisle's house and gardens and neighbourhood were covered with a large flight of that small insect called ladybird; and we had no doubt then that they were wafted over by the wind from France. I hope our fruit may not be again destroyed as it was last year. *J. Lisle, LL.D., St. Fagan, Cardiff.*

Societies.

Horticultural, July 11: Garden Exhibition.—On this occasion fruit was unusually abundant and excellent, and formed, as it was intended it should do, the most attractive feature of the show. Of Pine Apples there were no fewer than 50 specimens, most of them large and handsome; Black Grapes numbered 20 dishes, and of White varieties there were 21 exhibitions; Peaches and Nectarines amounted to some 60 dishes, and Cherries, Strawberries, and Melons were proportionately numerous.

Collections of Fruit.—Of these, considerably the best came from Mr. Ingram, gr. to her Majesty at Frogmore. It contained a Queen Pine Apple weighing 4 lbs., and beautifully ripened; admirable specimens of Victoria and Jefferson Plums; very fine Royal George and Bellegarde Peaches, Murrey Nectarines, Black Hamburgh and Royal Muscadine Grapes, Elton and Black Eagle Cherries, and Prince of Wales Strawberries. Mr. M'Ewen, gr. to the Duke of Norfolk, at Arundel, also had a collection in which were Victoria Plums, Royal George and Walburton Peaches, Hunt's Tawny and Murrey Nectarines, a Queen Pine Apple, Black Hamburgh and Muscat Grapes, red and white Gooseberries, Elton Cherries, and Brunswick and other Figs. Mr. Watson, market gardener, Ealing, sent three Queen Pine Apples, good Elruge Nectarines, Muscat Grapes somewhat unripe, Black Circassian Cherries, two Melons, and British Queen and Keens' Seedling Strawberries.

Pine Apples.—Mr. Jones, gr. to Lady Charlotte Schroiber, furnished a Providence weighing 12 lbs. 3 oz.—a noble looking fruit, but green towards the top. Mr. Fleming, gr. to the Duke of Sutherland, had a Providence weighing 6 lbs. 12 oz., and a fruit of the same variety, weighing 5 lbs. 12 oz., came from Mr. Turnbull, gr. to the Duke of Marlborough at Blenheim; the last-named exhibitor also sent a Cayenne weighing 4 lbs. 12 oz. A Providence weighing 5 lbs. 12 oz. was furnished by Mr. Dodds, gr. to Col. Baker; and from Mr. Taylor, gr. to H. C. Ingram, Esq., came two specimens of Black Prince, the best of which weighed 7 lbs. 12 oz. These were large and beautifully-grown fruit, but overripe towards the base. The best Queen Pine came from Mr. Gostling, gr. to Mrs. Deacon; it weighed 4 lbs. 15 oz. Mr. Spivey, gr. to J. A. Houblon, Esq., Mr. Davis, gr. to T. W. Booker, Esq., Mr. Fleming, gr. to the Duke of Sutherland, Mr. Barron, gr. to Mrs. Vivian, Mr. Jones, gr. to Lady Charlotte Schroiber, Mr. Merryfield, gr. to H. J. Grant, Esq., Mr. Dodds, and Mr. Taylor also all exhibited Queen Pines, the heaviest of which weighed 4 lbs. 10 oz.

Grapes.—Excellent Black Hamburgh, large both in bunch and berry, and extremely well coloured, came from Mr. Stent, gr. to W. Herbert, Esq.; Mr. Fleming, gr. to the Duke of Sutherland, also had admirable examples of this variety; but scarcely so perfect as Mr. Stent's, the point of one of the bunches being deficient in colour. This last mentioned bunch was stated by Mr. Fleming to weigh upwards of 3 lbs. The same exhibitor likewise showed specimens of Mill Hill Hamburghs, which were in all respects perfect; one of the bunches in this exhibition must also have weighed more than 3 lbs. Mr. Williamson, gr. to the Earl of Lonsdale, Mr. Forsyth, gr. to Baron Rothschild, Mr. Tillyard, gr. to the Rt. Hon. the Speaker, and Mr. Hill, gr. to R. Sneyd, Esq., also showed black Hamburghs, which though good, were all inferior to the magnificent bunches produced by Mr. Stent and Mr. Fleming. Three good bunches of Black Prince, well coloured, but not large in berry, were wrongly shown in this class by Mr. Turner, gr. to J. Hill, Esq., of Streatham. In the Market Gardeners' Class Mr. Harrison, of Oatlands, had a basketful of Black Hamburgh, not large either in bunch or berry; but extremely well coloured, and covered with a most beautiful bloom. Muscats, though not possessed of that fine golden tinge which they should have when in perfection, were riper and better on this occasion than we have seen them at any previous show this season. The best came from Mr. Turnbull, gr. to the Duke of Marlborough; these were large both in bunch and berry; good exhibitions of this variety also came from Mr. Strachan, of Beach Hall, near Chester; Mr. Mitchell, of Brighton; Mr. Allport, gr. to H. Akroyd, Esq.; Mr. Clarke, of Hoddesdon; Mr. Tillyard; Mr. Smith, gr. to S. Ricardo, Esq.; and Mr. Taylor, gr. to J. Coster, Esq. Frontignans were furnished in excellent condition by Mr. Fleming and Mr. Tillyard; the last named exhibitor likewise showed beautiful bunches of White Muscadine, as did also Mr. Shrimpton, gr. to A. Doxat, Esq.; Mr. Busby, gr. to J. Crawley, Esq., exhibited three excellent bunches of his new Seedling Grape called Stockwood Golden Hamburgh, a valuable acquisition, which at first sight might easily be mistaken for a Muscat of Alexandria; it is, however, in reality quite a different thing, having no muskiness whatever in its flavour, which may be described as intermediate between that of the Sweetwater and Black Hamburgh. This excellent addition to White Grapes we are informed will ripen in perfection in the same house with the Black Hamburgh.

Peaches and Nectarines.—Mr. Turnbull, gr. to the Duke of Marlborough, showed very fine specimens of Bellegarde Peaches and Elruge Nectarines; and Royal George Peaches, and red Roman Nectarines, nearly equally good, came from Mr. Mitchell, of Brighton. Mr. Miller, gr. to Sir W. Smith, Bart., contributed Grosse Mignonne Peaches and Violette Hâtive Nectarines; and good Royal George, and other Peaches, and Elruge and Violette Hâtive Nectarines, came from Mr. Munro, gr. to Lord Clarendon, and Mr. Munro, gr. to Mrs. Oddie. Mr. Ingram, gr. to J. J. Blandy, Esq., sent Noblesse, Bellegarde, Royal George, and Acton Scott Peaches. In the class of single dishes of Peaches Mr. Judd, gr. to Earl Spencer, showed beautiful specimens of Grosse Mignonne; Mr. Davies, gr. to J. Dixon, Esq., sent Royal George; Mr. Mitchell, gr. to Lord Wenlock, Bellegarde; Mr. Clements, of Oak Hill, Noblesse; Mr. Busby, gr. to J. Crawley, Esq., Violette Hâtive; Mr. Tillyard and Mr. Frost, gr. to R. L. Betts, Esq., Noblesse; Mr. Fleming, Royal George; and Mr. Macqualter, gr. to Colonel Challoner, and Mr. Hay, gr. to the Bishop of London, Bellegarde. Of Nectarines, Violette Hâtive, large in size and beautifully

coloured, came from Mr. Clements; and excellent dishes of the same variety were furnished by Mr. Macqualter, Mr. Frost, Mr. Wilson, gr. to J. Elger, Esq., Mr. Judd, and Mr. Busby. Mr. Munro, gr. to Mrs. Oddie, also showed good specimens of Red Roman Nectarines.

MELONS.—The best were a hybrid Cashmere, a tender white-fleshed sort, and a Trentham hybrid, from Mr. Fleming. The next in point of merit was a Beechwood, from Mr. Batchelor, gr. to J. Shoolbread, Esq.; Mr. Brown, gr. to Colonel Biddulph, had a good Bromham Hall, and Mr. M'Ewen, gr. to Colonel Windham, at Petworth, sent Lord Montague, a green-fleshed variety. The heaviest Melon was furnished by Mr. Pengilly, gr. to R. J. Thomson, Esq.; it was a green-fleshed sort, weighing 4lbs. 13 oz. Mr. Tegg, gr. to A. Pryor, Esq., showed an Egyptian green-fleshed, which weighed 4 lbs. 1 oz.

CHERRIES.—Excellent specimens of Black Circassian were contributed by Mr. Taylor, market gardener, Brentford; the same variety also came from Mr. Meyers, of Brentford, and Mr. Meyers, of Ealing; Mr. Jones, of Brentford, likewise sent Black Circassian, and Mr. M'Ewen, gr. to Colonel Wyndham, Knight's Early Black. Of white varieties, Mr. Meyers, of Brentford, sent Bigarreau, large and fine; Mr. Taylor, beautiful specimens of Elton; Mr. Meyers, of Ealing, Bigarreau; Mr. M'Ewen, the same variety, and Mr. Mitchell, of Brighton, Elton.

FIGS.—Brown Turkey and Brown Ischia came from Mr. Mockett, gr. to J. Allnutt, Esq., and Mr. Judd, gr. to Earl Spencer.

RASPBERRIES.—The only dish shown was one of Beehive, from Mr. Lydiard, of Bath.

STRAWBERRIES.—The best collection was furnished by Mr. Lydiard, of Bath. It contained large and fine examples of Goliath, Princess Royal, and Victoria; Mr. Macqualter and Mr. Tillyard also had good collections, in which we remarked a very fine basketful of the white Bicton Pine. Mr. Ingram, gr. to J. J. Blandy, Esq., sent Keens' Seedling, British Queen, and Princess Alice Maude. In the class of large Strawberries (flavour being set aside) Mr. Smith's (of Twickenham) Sir Charles Napier was the lion of the exhibition; nearly equal to it, however, were the remarkably fine specimens of British Queen shown by Mr. Jones, of Brentford. Mr. Lydiard, of Bath, also had very large fruit of Goliath. Among best flavoured Strawberries a dish of Hautbois, shown by Mr. Macqualter, was placed first by the Judges; next came British Queen from Mr. Smith, of Twickenham, and Mr. Beach, of Isleworth; and then followed Mr. Ward's Omar Pacha; Keens' Seedling, Trollop's Victoria, Ingram's Prince of Wales, and Goliath were also shown in this class.

PLUMS.—Three beautiful dishes of these were furnished by Mr. Ingram, gr. to her Majesty at Frogmore. They consisted of Washington, Goliath, and Green Gage.

RARE EXOTIC FRUIT.—Mr. Ivison, gr. to the Duke of Northumberland at Syon, sent Plantain fruit, Nutmegs, and Vanilla.

FRUIT TREES IN POTS came from Messrs. Lane, of Berkhamstead; and Mr. M'Ewen, gr. to the Duke of Norfolk. The former sent Peaches and Nectarines, well furnished with green fruit; Morello Cherries, ripe, large, and good; and Gooseberries approaching ripeness. Mr. M'Ewen's exhibition consisted of Royal George Peaches, and Violette Hâtive Nectarines, both carrying ripe fruit, which was well coloured, but small.

ORCHIDS.—These were contributed in considerable quantities and in excellent order. In collections of 10 plants Messrs. Veitch sent Aerides Lobbi, a beautiful species in the way of affine, but more highly coloured; A. odoratum and its large variety; the singular looking and really handsome green tailed Dendrochilum filiforme, Saccolabium guttatum, Sobralia macrantha, the white Butterfly plant (Phalænopsis), the charming brown spotted rich orange yellow flowered Dendrobium chrysanthum, and a large flowered variety of the Bearded Lady's Slipper. Mr. Gedney, gr. to Mrs. Ellis, of Hoddesdon, contributed magnificent specimens of Phalænopsis with flowers as fresh, large, and clean as if it had been the month of May; also Oncidium Lanceanum and pulvinatum, Saccolabium furcatum, the brilliant orange-flowered Epidendrum vitellinum, E. verrucosum, Aerides quinquevulnera, still a rare species, a well bloomed Calanthe masuca, and the white flowered Phaius. Mr. Woolley, gr. to H. B. Ker, Esq., sent Sarcopodium Lobbi, Lælia cinnabarina, Cattleya violacea, a handsome kind; the White Calanthe veratrifolia, Sobralia macrantha, Epidendrum radiatum, Odontoglossum Lawrenceanum, Oncidium Lanceanum, and the white blossomed Phaius.

Of six ORCHIDS, there were four collections. Mr. Carson, gr. to W. F. G. Farmer, Esq., produced Miltonia spectabilis, the beautiful Cattleya superba, Phaius albus, Saccolabium Blumei, with several noble spikes of flowers on it, some of them perhaps scarcely forward enough; an extremely well managed Dendrochilum filiforme, and an example of the Bearded Lady's Slipper. Mr. Woolley furnished Saccolabium furcatum and guttatum, the orange flowered Epidendrum rhizophorum, Cattleya Harrisoniæ in beautiful condition, Aerides affine, and Vanda tricolor. Mr. Ivison, gr. to the Duke of Northumberland, at Syon, contributed the large and beautiful variety of Cattleya Mossiæ which he has shown before this season; also Oncidium ampliatum and luridum, Aerides odoratum, and Epidendrum macrochilum. Mr. Dunsford, of Chingsford, Essex, communicated, among others, nice plants of Saccolabium guttatum, Stanhopea oculata, well flowered, and Oncidium pulvinatum and leucochilum. Messrs. Veitch had their new variety of Cypripedium barbatum called superbum, and Mr. Carson Epidendrum rufum, a dull yellow-flowered kind.

VARIEGATED PLANTS were, as they deserved to be, much admired. In Messrs. Veitch's collection of them were several handsome panfulls of variegated Orchids; also Caladiums, Crotons, Dieffenbachia picta, variegated Screw Pines, Maranta albo-lineata, and other varieties of this fine genus; the charming Cissus discolor, Bilbergia rosea, beautifully mottled with white; the pretty Begonia Thwaitesi, the white veined Aphelandra Leopoldi; Coleus Blumei, with brown blotched leaves, edged with pale green; a variegated Hydrangea and Sonerila margaritacea, whose foliage, sown as it were with pearls, renders this valuable little plant always interesting. Messrs. Lee contributed, among other things, Pavetta borbonica, Cissus discolor, Caladiums, Dracæna ferrea, Maranta zebrina; Aphelandra Porteana, a fine kind with rich orange yellow inflorescence; Begonia splendida, one of the handsomest of the genus, as far as fine foliage is concerned; Crotons and variegated Screw Pines. Messrs. Rollisson sent Caladiums, Yuccas, Ananassa sativa variegata, Dracænas, Hoyas, Marantas, Pavetta borbonica, and variegated Orchids. Messrs. Henderson, of Pine Apple Place, and Messrs. Jackson of Kingston also furnished groups, in which were Dichorisandra pumila, a variegated Agapanthus umbellatus, Hoya carnosa variegata, a Brunsfelsia, Dracæna versicolor, Tillandsia splendens, the red-veined Echites nutans, a variegated variety of Aspidistra lurida, Eranthemum leuconervium, and other plants the names of most of which we have already enumerated.

Of PLANTS with fine FOLIAGE Messrs. Veitch contributed a collection, the greatest portion of which consisted of Palms, Zamias, and Ferns intermixed with Dracæna ferrea, Philodendrons, Plumierias, and other interesting species. Messrs. Rollisson, Henderson, and Jackson also furnished groups in which we remarked Eugenia oleoides, Laurus Cassia, Rhopalas, Metrodorea atro-purpurea, Aralias, Brownias, Araucarias, Brexias, Grevilleas, Dracænas, Stenocarpus Cunninghami, Caladiums, Palms, and some of the more striking of the large-leaved Ferns.

HOTHOUSE FERNS were well grown, and would have formed, had they been plentiful enough, an important feature of the exhibition. Collections of them came from Mr. Carson, gr. to W. F. G. Farmer Esq.; Messrs. Rollisson, and Mr. Gedney, gr. to Mrs. Ellis. In these exhibitions we remarked Asplenium Nidus Avis, fragrans, lucidum, and Belangeri; Lastræa paludosa, Acrostichum alcicorne, Blechnum corcovadense, Adiantum formosum and cuneatum, Cibotium Schiedeanum, Darea cicutaria, Aspidium coriaceum, Lomaria Patersoni, Drynaria coronans, with noble leaves more than 3 feet in length; Pteris tremula and umbrosa, Platycerium grande, Nephrolepis neglecta, Davallia tenuifolia and Sitolobium adiantioides, together with others mentioned in our report of the Royal Botanic Society's exhibition last Saturday.

HOTHOUSE LYCOPODS, well varied, and extremely well grown, came from Messrs. Gedney, Veitch, and Woolley. Among the different varieties were Apodum, a compact and pretty kind; cæsium, and its large variety, viticulosum, Wildenovi, stoloniferum, Mertensi, umbrosum, flexuosum, formosum, Galeotti, cordatum, and inæqualifolium. The bright metallic hue of some of these, together with the elegant forms of others, deservedly rendered these exhibitions objects of much interest.

ROSES (cut) filled nearly one side of a long tent, and the weather being wet and cool they maintained their freshness and beauty till the close of the day. Collections of 50 sorts were contributed by Messrs. Mitchell, of Piltdown; Paul, of Cheshunt; Lane, of Berkhampstead; Francis, of Hertford; and Wilkinson, of Ealing: and of 25 varieties by Mr. Munro, gr. to the Earl of Clarendon; Mr. Terry, gr. to Lady Puller; and Mr. Busby, gr. to J. Crawley, Esq. Mr. Mitchell's blooms were altogether extremely fine, and attracted much attention. In the different boxes we noticed examples of nearly all the leading kinds in cultivation; but more especially of Paul Ricaut, a fine Rose, with a glowing crimson colour; Hybrid Perpetual General Jacqueminot, a more brilliant flower than even Géant des Batailles itself; Coupe de Hebe, which everybody knows to be a first-class Rose; William Griffiths, Cloth of Gold, Vicomtesse Decazes, and Gloire de Dijon, together with Souvenir de Leveson Gower, Triomphe de Paris, Paul Dupuy, General Castellane, Madam Rivers, and Prince Leon. These last are comparatively new kinds, which we hope to notice more fully hereafter.

NEW PLANTS were scarce; Messrs. Veitch sent Ixora floribunda, a rich salmon kind, and apparently a very free flowerer; Fenzlia dianthiflora, whose flowers, owing to the dullness of the day, did not open; and Phygelius capensis with long brown tubular blossoms. The same firm also exhibited spikes of a Californian Lupin, a strong growing pinkish-flowered kind, and plants of their shrubby Californian Phlox (Leptodactylon). I. Anderson, Esq., of Maryfield, near Edinburgh, sent Salvia carduacea, a grey-leaved Thistle-like species with lilac flowers, and two white-flowered Gilias. Mr. Carson had Ornitharium striatulum. Of New Plants not in flower, Mr. Linden furnished two kinds of Calanths, both with handsome leaves, and Calyptraria hæmantha.

In the class of New Garden HYBRIDS, Messrs. Rollisson showed Gloxinias, the best of which were Maria Paulovnia, and erecta grandis; also Achimenes Dr. Hoff, a variety very much like the continental kind named Ambrose Verschaffelt. Messrs. Henderson, Mr. Glendinning, and Mr. Woolley, also exhibited Gloxinias, the best of which were alba auriculata, white-ringed with crimson, and erecta auricula, violet. Messrs. Veitch again showed their Princess Royal Rhododendron. Mr. Ingram sent a hybrid Achimenes in the way of pedunculata, but far more brilliant, and extremely handsome. Mr. Bragg, of Slough, contributed some very pretty varieties of Sweet Williams in pots, and cut flowers of the same came from Mr. Hunt, of High Wycomb.

Of FUCHSIAS Mr. Gaines, of Battersea, showed a collection of well-grown plants, whose names we have given on former occasions. Messrs. E. G. Henderson furnished two of their white corolla'd Fuchsias, which are certainly curiosities in their way. One of them, named Princess Royal, appears to be a free grower, and will doubtless form a good addition to this class of plants.

Of variegated leaved PELARGONIUMS, Mrs. Conway, of Earl's Court, Brompton, sent a collection consisting of Brilliant, Golden Chain, Flower of the Day, Lee's Attraction, Silver-striped, and Mountain of Light. These were all neat dwarf plants. A collection of prettily variegated varieties was also shown by Mr. Barter, gr. to T. Lenox, Esq., who we need not state is a very successful raiser of such things.

PELARGONIUMS, both fancy and ordinary kinds, came from Mr. Gaines, who had also fine plants of Attraction and Mountain of Light, both finely variegated varieties. The same exhibitor also sent examples of the French sorts called Elise Miellez, Dr. Margolin, Eugene Sue, Solomon, Dr. Andrey, and Adolph Odier. These, although not well formed, are well worth growing on account of their gay colours.

Of VERBENAS in pots there were two collections; one from Mr. Wetherall, gr. to D. McNeill, Esq., who also sent cut blooms; the other from Mr. Higgs, gr. to Mrs. Barchard. Both were deficient in bloom. The plants in the group from Mr. McNeill were tied down to horizontal circular trellises, a plan which is perhaps preferable to fastening the shoots to upright sticks. In our report of the Royal Botanic show last week we stated that Verbena Sir Colin Campbell was shown by Mr. Smith. This is a mistake; it was contributed by Mr. M'Neill.

PINKS came from Messrs. Turner, Bragg, and Mitchell, and were considered by the judges worthy of an extra prize. All of them were fair specimens for the season. Mr. Turner had a promising well laced new flower called "Peter Young."

Among MISCELLANEOUS PLANTS were Hemiandra pungens, and Stylidium scandens, from Messrs. E. G. Henderson, St. John's Wood; a large and unusually well flowered specimen of Roupellia grata, from Mr. Carson, gr. to W. F. G. Farmer, Esq., who also sent pretty plants of Hoya bella and Dipladenia crassinoda.

Notices of Books.

We perceive that Mr. Willis is bringing out a new edition of Wood's *Index Testaceologicus* in parts, price 4*s.* 6*d.* each. The revision of the work has been intrusted to Mr. Sylvanus Hanley. Each part is to contain three coloured plates, averaging 180 coloured figures. The specimen before us is extremely well got up.

A new and greatly enlarged edition of *Eliza Acton's Cookery* has just appeared (Longmans, 7*s.* 6*d.*), embellished with numerous woodcuts, and enlarged by the addition of a great number of new receipts. We need not say that this is one of the most useful of our English publications on domestic economy, containing as it does all that the housekeepers or cooks of the middle classes can require to know. The authoress informs the public that in the present edition she has availed herself of the instructions upon cookery given by men of science and especially by Baron Liebig; we can only express a hope that our cooks will appreciate the advice. Mrs. Acton adds what is of much more interest, that efforts are being made, by the establishment of well conducted schools, for the early and efficient training of our female domestic servants. Let us trust that her expectations may soon be realised, and that we shall be provided with a race of cooks not too ignorant to use the good advice which they find in the many good cookery books now within everybody's reach. We would even commend the subject to the Board of Health, as one which most especially comes within their line of operation; for it is of little use to purify the atmosphere we breathe until general health is improved by rendering what we eat conducive to nutrition rather than to indigestion. In no country do better raw materials of food exist than in England; nowhere can be found better flour, better meat, better fish, better vegetables, we will even add better fruits. Nowhere in the world, notwithstanding these advantages, is to be found worse cookery than among our middle classes. But we hope and believe that some improvement in this respect is beginning to take place, and above all that some serious attempt will be made to teach our lower orders how to economise and best employ the materials of food which they possess. Had our peasantry been even decently taught the rudiments of *good* plain cooking, we should never have heard the heartrending tales of starvation at Scutari caused by the uneatable provisions supplied to our neglected troops.

FLORICULTURE.

NATIONAL FLORICULTURAL SOCIETY, *July* 12.—Dr. Sankey in the chair. Dr. Maclean, of Colchester, exhibited a seedling Pink named Purity, to which a First-class Certificate was awarded. Mr. Turner, of Slough, also obtained a First-class Certificate for "Peter Young," a full-sized dark-laced variety. Mr. J. Cole, of St. Alban's, sent some seedling bedding Calceolarias, one of which, "Compacta" (bright bronze yellow), obtained a Certificate of Merit; it is a free blooming attractive variety. Mr. Speed, of Edmonton, exhibited a desirable scarlet Geranium named General Simpson, brilliant orange-scarlet in colour, with a white centre; it has a full-sized truss, and its flowers are very persistent; a Certificate of Merit was awarded it. A First-class Certificate was given to Mr. Todman, Clapham Park, for Verbena General Simpson, a dull carmine variety, but with a well-formed truss. The same grower also sent a promising seedling fancy Geranium named Sir Colin Campbell, which the judges wished to have before them in better condition. Messrs. Veitch & Son exhibited a spotted Geranium called Agnes, which is good in form and substance, and brighter than Sanspareil; a Certificate of Merit was awarded it. Several other seedling plants were exhibited, and among them a bedding Geranium named Quercifolium floribundum, apparently a desirable variety for bedding, but it was not shown in good condition. Mr. George Smith sent blooms of his seedling Petunia Hermione, white with bright purple spots, a distinct and attractive variety. The 1st Prize for 12 Verbenas was awarded to Mr. C. P. Lochner, for Maryanne, Titus, Reine des Amazons, Caliban, Mrs. D. Tysson, Subram, Eva, Queen, Mrs. Mills, Elizabeth, and Shylock. The 2d Prize was gained by Mr. George Smith, for Mrs. Woodroffe, Alice, Standard, Rosea, Madame de la Vallière, Iver Rival, Comtesse de Belleville, Lord Ragtan, Madame Schmidt, Brillante de Valse, Eblouissante, and Queen. Mr. Turner sent a stand of 24 Pinks. The Rev. J. Dix was proposed a member.

Miscellaneous.

Climate of Orchids.—Mr. Motley, when describing the vegetation at 10,500 feet of elevation in Java, on the Pangerongo Mountain, observes: — Up among these plants, amid the Moss which hangs to the trees in masses as big as a man's body, are two fine parasitical Orchids, a Dendrobium with bright purple flowers, D. purpureum, and a little pseudobulbous plant with large flowers like a Cymbidium; and yet these plants, often exposed to 36°—38° Fahr., we should perhaps put at home into an orchideous stove at 85°, and then be surprised when they died. I was much astonished at the distribution of plants of this tribe. I have often been puzzled why I did not get more species at Labuan and in other steamy hot places down at the sea-level, where, I believe, most English botanists would hope to find them; whereas at about 4000 feet, with a night temperature of 45° to 50°, every tree is laden with them. Surely we are in the habit of coddling them (to use a Yorkshire word) too much in our stoves; and when it is considered that a change of plan would bring these lovely and curious plants within reach of many zealous cultivators who cannot now afford the expense, it would surely be worth some nurseryman's while to try the experiment on a large scale of cooler houses for Orchids. *Hooker's Journal of Botany.* [We long ago anticipated this suggestion, which is already carrying out with the greatest advantage by our best growers.]

Among Sweet Herbs, Basil (Ocimum basilicum) has been much grown, as a condiment or for medicinal purposes, in all hot countries from the very earliest times on record. It is an annual that sows itself so abundantly over the warmer regions of Asia and Africa, that it is impossible to say which may have been its original native country. Numerous varieties are recorded as produced by cultivation, and some other species are grown in India and Africa, but the common O. basilicum (which I am now convinced should include the O. minus) is the only botanical species known in Italy, where several varieties are great favourites in the cottage windows of the lower orders. Sweet Marjoram (Origanum Majorana) was introduced by the ancient Romans from Egypt or Syria, where it is still common in a wild state. Tarragon (Artemisia dracunculus), widely spread over South Russia, was brought, probably, from the shores of the Black Sea, in more recent times. The first mention on record is by Simon Seth, in the middle of the 12th century, but it appears to have been scarcely known as a condiment till the 16th century. *Journal of Horticultural Society.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—During bright warm weather the beds and borders of this house must be liberally supplied with water; any of the specimens or twiners upon which red spider may seem inclined to be troublesome should be well washed with the engine as often as may be necessary to thoroughly clean them. But things in flower must not be dashed over-head with the engine, and all pot specimens in flower should be removed out of the way, and others spared as much as possible. If former directions have been attended to, however, keeping the beds and borders properly supplied with water, and the atmosphere moist, red spider will hardly be troublesome except upon things in a weakly state, or those growing in poor exhausted soil, and such should be assisted by an occasional watering with manure water, but this must be used in a very weak state for New Holland and other plants which are readily injured by too strong manure water. A little weak and often is greatly preferable to strong doses. Look over the pot specimens on the forenoons of bright hot days, in order to see that everything is well supplied with water at the root, for a day's neglect in watering at this season may tell seriously upon the beauty of the finest specimens. Remove decaying leaves and flowers immediately they are perceptible, and endeavour to have a good supply of specimens in full beauty, so as to be able to replace any that are becoming shabby; also keep pots, floors, and everything about this house scrupulously clean and neat. GREENHOUSE.—Many of the usual occupants of this house will do better in a sheltered situation out of doors while the weather continues fine than under glass, and such things as Epacrises, the freer growing varieties of Heaths, the hardier kinds of New Holland plants, and many other things should be removed to a sheltered shady situation out of doors, but where the glass can be removed at night, so as to afford the plants the benefit of the night dews, there will be nothing gained by removing any kind of plants to the open air; and specimens that have not fairly started into growth after being cut back should be kept under glass until this is the case, dewing them over-head with the syringe on the evenings of fine days, and using every means to keep the atmosphere about them moist until they get into free growth. Most hard-wooded plants in frames will be benefited by exposure to the night dews, and the sashes should be thrown off late in the evening, replacing them in the morning, and shading against bright sunshine, and giving air freely back and front, or tilting the sashes at the sides, which is the better practice, as it admits air freely without the plants being so much exposed to currents of drying air. Things in want of more pot-room should be shifted as soon as possible, so as to get them well established in their fresh pots before winter; but in shifting hard-wooded plants in hot dry weather great care should be exercised to have the balls and soil in a properly moist state, and the plants must be carefully shaded, keeping the atmosphere as moist as possible for a few weeks after shifting.

FORCING DEPARTMENT.

PINERIES.—Assist plants swelling their fruit with a high moist temperature and plenty of manure water at the root, shutting up early in the afternoon and syringing the plants lightly. Be careful, however, with fruit colouring, and keep these as dry as circumstances will admit, otherwise they will probably be deficient in flavour. Give every possible attention to securing a supply of fruit for autumn and early winter use, keeping plants that appear to have completed their growth rather dry at the roots, and fully exposing them to the sun for a few weeks, in order to give them a rather severe check. Plants intended to show fruit towards October and November should be kept growing away freely for some time yet, and these must be carefully supplied with water at the root during bright hot weather; also be very careful in supplying young stock with water, and affording them a moist atmosphere, as any neglect in this respect during the present state of the weather will be very apt to cause them to show fruit prematurely; and young stock from which free growth is expected must not be allowed to suffer for the want of pot room. VINERIES.—Attend to last week's directions as to thinning late fruit, for depend upon it that a very moderate crop of first-rate fruit will be more valued and more satisfactory to the owner than ever so heavy a crop if of inferior quality; therefore, thin severely and early, and give every attention to keeping the foliage clear of insects, and the Vines in vigorous health. Where the borders are of a rather dry light nature, an occasional soaking of manure-water may be given with advantage to plants swelling their fruit, and inside borders will require a liberal supply of water while the weather continues hot and dry. Give abundance of air day and night where the fruit is colouring. PEACHES.—Look sharply after red spider upon the trees generally, particularly any that are rather weak from being over-cropped, or from any other cause, and give the trees a thorough washing with the engine wherever this pest is perceived, repeating this as often as may be necessary to thoroughly eradicate the pest. Do not allow the borders to become too dry where the fruit is not yet ripe, and trees from which the fruit is gathered must not be allowed to get excessively dry at the root if the foliage is to be kept in health for any length of time. MELONS.—Do not allow the bottom-heat to decline in dung beds, for although it might safely enough be dispensed with while the weather continues hot, it cannot be renewed all at once when a change of the weather may render it necessary, and a crop of fruit is often injured by neglecting the bottom-heat during fine weather, therefore apply linings wherever they may be necessary to maintain a gentle bottom-heat, especially where the fruit is setting. Give every attention to keeping the foliage clear of insects, keeping the surface of the soil moist wherever this can be safely done, but keep the atmosphere dry where the fruit is ripening.

FLOWER GARDEN AND SHRUBBERIES.

Go over the beds frequently, keeping the young shoots of Verbenas, &c., nicely regulated and pegged down until the beds are fairly covered, after which, unless where the soil is very strong, or where it may be desirable to keep the masses as low as possible, the shoots of most varieties may be allowed to grow at liberty. Keep the surface soil clear of weeds, and should the weather be such as to render watering necessary, do not let the plants feel the want of moisture at the root. See that Dahlias and Hollyhocks are tied as they advance in growth. Look over Roses, and dip any shoots found to be infested with green-fly in tobacco-water. Also keep these well supplied with water at the root, which will greatly improve the flowers as well as prolong the beauty of the plants, for the flowers soon fade in bright hot weather when the plants are allowed to get dry at the root.

HARDY FRUIT AND KITCHEN GARDEN.

Get all kinds of winter greens planted out as speedily as ground can be obtained; and where this cannot be done at present to the usual extent, see that the plants are either pricked out or sufficiently thinned to allow of their growing dwarf and strong; and if a goodly portion of old Mushroom-bed dung were mixed with the soil before pricking out, the roots would run into this, so that the plants might be removed with balls, and would hardly feel the shift. Also get Leeks planted on strong, deep, heavily manured land, and attend to these and all other newly planted things with water until they get fairly established. Give the Asparagus plenty of manure water from the stable or farm-yard tank, in order to strengthen the roots after cutting and induce strong growth. On dry, friable soils a good dressing of salt may be applied with advantage; but this should not be given on strong tenacious soils, as it keeps the ground wet and heavy in winter and decays the roots. Proceed with the planting out of Celery as fast as ground can be spared, and see that the whole is liberally supplied with water. See to keeping up a succession of French Beans, also Salad of all kinds, making a sowing of Parsley for winter use.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 12, 1855, as observed at the Horticultural Gardens.

July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind	Rain

Average.		29.844	29.772	77.7	53.4	65.5	64.5	61.2		[illegible]

July 6—Foggy; hot and dry; fine.
— 7—Hazy; very fine throughout,
— 8—Very fine; light clouds; overcast at night.
— 9—Hazy; slight rain; very fine; thunder, much lightning and rain.
— 10—Cloudy and fine; very fine; partially overcast.
— 11—Constant heavy rain.
— 12—Overcast; very fine throughout.
Mean temperature of the week 2½ deg. above the average.

RECORD OF THE WEATHER AT CHISWICK.
During the last 29 years, for the ensuing week, ending July 21, 1855.

July.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 15	75.0	50.3	62.6	15	1.46 in.	1	3	3	1	4	12	3	—
Mon. 16	76.2	51.1	63.7	8	1.60	2	3	3	—	2	12	5	[illegible]
Tues. 17	75.8	53.2	64.5	11	0.56	2	—	2	2	4	10	6	[illegible]
Wed. 18	73.7	51.5	62.6	13	1.22	—	—	1	—	5	11	4	[illegible]

Frid. 20	71.5	51.4	61.4	17	0.47	1	1	2	—	1	15	[illegible]	[illegible]
Satur 21	72.4	51.1	61.7	12	0.54	2	—	1	1	3	11	3	3

The highest temperature during the above period occurred on the 17th, 1834—therm. 94 deg.; and the lowest on the 18th, 1851—therm. 39 deg.

Notices to Correspondents.

ARCHERY: *S Y.* Roger Ascham's book is by far the best. The modern works on the subject are, as far as we have seen, chiefly indifferent abridgments of his graphic instructions.

BEES: *H H.* You may use either ether or chloroform for stupefying your bees with perfect safety.‡

BOOKS: *J W.* Loudon's edition of "Repton," and Downing's "Landscape Gardening."‡

DEODARS: *Diss.* The ends of the leaves have been killed by something before they began to separate, and now they cannot do so; the consequence being that they are distorted in the struggle to separate at the base. What the cause is we know not. Certainly not light land, for nowhere do Deodars grow better than in the thin light soil of Dropmore.

INSECTS: *G R L.* We were unable to find any insect on your Parsnip, which was quite dried up. Can you favour us with other specimens?—*W F.* Your insects are one of the commonest kinds of weevils, Otiorhynchus vastator. The perfect weevils feed on a variety of garden plants, especially relishing buds of fruit trees, and their larvæ on succulent roots of plants.—*Althæa.* Your slip of Hollyhock was infested with a specimen of Oxytelus morsitans (one of the Staphylinidæ), a small mite and the larvæ of two different kinds of flies (Muscidæ). All common on decaying vegetables, and not, as we believe, the cause of the disease. Can you send us larger specimens of the diseased stems? *W.*

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*G N.* 2, Eucomis punctata; 6, some Stapelia not in flower; 4, apparently some Struthiola, perhaps ovata, not in flower. The berries may belong to the Chasselas musqué.—*L P.* Pyrus hybrida and Cerasus virginiana.—*Constant Reader.* A common pond weed, called Potamogeton crispus.—*Another Constant Reader.* Sanicula europæa. Would it not be more convenient to drop this everlasting signature, which only leads to confusion?—*Grass.* Aira cæspitosa, which always grows in tufts, and was in all probability introduced from having been mixed with bad Grass seed.—*T D.* Pelargonium Radula.—*J S P.* Myosotis alpestris.

RAT TRAPS: *G S s.* You are right. The plan we now find was originally published many years ago in the "Gardeners' Magazine;" a circumstance we had forgotten. The oversight shows that we are not familiar with the history of rat-catching, but not that the plan is otherwise than a good one. Mr. Van Hoytema stated it to have been taken from the "Farmer's Magazine" as we mentioned, and was as much in the dark as to its real origin as we were.

RHODODENDRONS: *R C L.* Do not move them now. In the end of August, or beginning of September, you may do so with safety.

MISC: *Delta.* The dry weather we have experienced may possibly account for your Rose tree shedding its buds this year. A the young shoots of your Gooseberries may be stopped with advantage, except those at the ends of the old branches, where you want new ones to fill up the bush.‡—*Corvus.* Full price will be given for the following Nos.: 1852, 39: 1853, 19, 37, and 45.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

PATENT SANITARY SEWAGE COMPANY'S NITRO-PHOSPHATED CARBON OR BLOOD MANURE, 5l. 10s. per ton, delivered in London, bags included. Each ton contains 1350 lbs. Blood and 11 per cent. of Phosphate of Lime.—Agents throughout the country.—22, Lincoln's Inn Fields, London.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

PATENT WOOL MANURE, 8l. 8s. per ton.—Application for Agencies, from persons of influence and respectability, will be received until the 31st inst.
NOTTIDGE & Co., 81, Gracechurch Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

BUDDING'S GRASS-CUTTING MACHINE nearly new and in first-rate condition, to be Sold a bargain Cuts, Rolls, and Sweeps the Grass whether wet or dry at one operation. Admirably adapted for lawns, pleasure grounds, &c. On view at W. S. MULLINGER'S, General and Furnishing Ironmonger, Enfield, Middlesex.
W. S. M. has also on sale a large and well assorted stock of Garden Tools of every description. Galvanised Wire Netting, 3-inch mesh, 2 feet high, 6d. per yard run. Iron Hurdles and Continuous Fencing made to order. Greenhouses or Conservatories heated with hot water apparatus on the best principle by experienced workmen. Estimates given.

SAMUELSON'S PATENT GARDNER'S TURNIP CUTTER, which has been awarded NINE PRIZES by the Royal Agricultural Society. Samuelson's Patent Forking or Digging Machine. Samuelson's Registered Budding's Lawn Mower; Patent American and other Churns; Kase's Patent and other Liquid Manure Pumps; McCormick's American Reaper with Burgess's Patent Self-clearing Platform; Chaff Cutters; Cake Breakers; Corn Mills, &c., &c., &c.
Manufactured by B. SAMUELSON,
Successor to the late JAMES GARDNER, Britannia Works, Banbury.
Some of the above may be seen at Stand No. 64, Royal Agricultural Show at Carlisle, and in the Agricultural Department, Crystal Palace, Sydenham. And may be procured by orders direct as above, or of any respectable Implement Dealers or Ironmongers in the country.
Catalogues may be had post free on application.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.; at Blenheim Palace, Trentham, Cleveden, Elvaston, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.
The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.
A. S. and Son have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.
ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.
Further particulars, with testimonials and prices, may be had on application.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. BROWN, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.
The Second Session of 1855 begins in August. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40l. per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

ANERLEY POULTRY SHOW—August 28, 29, and 30. Entries close August 6. Prize Lists, &c., may be had on application to the Secretaries, Anerley, Surrey.
EDGAR SMALLFIELD, HENRY F. WELLS } Hon. Secretaries.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—CARLISLE, 1855.

PROGRAMME.

THURSDAY, July 19.—Trial-yard open at 12 o'clock at noon, when the public will be admitted, at 5s. for each person, to view the trials of the Steam Engines. This payment has special reference to the Trial-yard only, and will not entitle the person who makes it to an admission into the general Show-yard for the exhibition of Implements.

FRIDAY 20, SATURDAY 21, MONDAY 23, and TUESDAY 24.—Trial-yard open at 9 o'clock in the forenoon, when the public will be admitted on each day at 5s. for each person, to view the Trials of the Steam Engines, Barn Works, and other Agricultural Machinery and Implements generally. This payment has special reference to the Trial-yard only, and will not entitle the person who makes it to an admission into the general Show-yard for the exhibition of Implements.

WEDNESDAY 25.—The Implement Yard open to the public from 7 in the morning till 6 in the evening; admission 2s. 6d. each person. The Judges to inspect the Live Stock and award the Prizes. At 1 o'clock (or as soon after as all the Judges shall have delivered in their awards), the public to be admitted into the Cattle-yard and to the Exhibition of Farm Poultry, on the payment of 10s. each person, at the Special Entrance; Members of Council and Governors of the Society being admitted by Tickets to be purchased at the Finance Department of the Society at the Show-yard. N.B. Notice will be posted up over such entrance when the Judges shall have completed their awards. At 8 o'clock in the evening the Yard will be closed.

THURSDAY 26.—The general Show-yard of Cattle, Horses, Sheep, Pigs, Farm Poultry and Implements open to the public from 6 in the morning till 6 in the evening; admission 2s. 6d. each person. The Dinner of the Society in the Pavilion adjoining the Show Yard at 4 o'clock, the doors open at 3.

FRIDAY 27.—The general Show-yard open to the public from 6 in the morning till 6 in the evening; admission 1s. each person. General Meeting of the Members in the Guildhall at 10 o'clock in the forenoon.

President—Mr. MILES, M.P.
Stewards of Departments.
CATTLE—Mr. Simpson, Mr. Woodward, Sir Stafford Henry Northcote, Bart., M.P.
IMPLEMENTS—Mr. Fisher Hobbs, Mr. Cavendish, Mr. Hoskyns.
POULTRY—The Hon. and Rev. Stephen Willoughby Lawley.
FINANCE—Sir Matthew White Ridley, Bart.; Colonel Challoner.
SALE OF TICKETS—Mr. Henry Wilson.
RECEIPTS AND ADMISSION TO SHOW-YARD—Mr. Raymond Barker.
PAVILION DINNER—Sir John V. B. Johnstone, Bart., M.P.; Sir John Villiers Shelley, Bart., M.P.; Mr. Brandreth, Mr. Thompson.
GENERAL ARRANGEMENT OF SHOW—Mr. Brandreth Gibbs.

By Order of the Council,
London, July 14. JAMES HUDSON, Secretary.

By the regulations of the Society, all persons admitted into the Show-yard, or other places in the temporary occupation of the Society during the meeting, shall be subject to the rules, orders, and regulations of the Council.

PAVILION DINNER TICKETS AND SUBSCRIPTIONS: at the Finance Department of the Show-yard. Pavilion Dinner Tickets, price 10s. each (including one-pint bottle of Wine), will be sold at the Finance Department of the Show-yard on the Wednesday and Thursday of the Show week, between the hours of 10 o'clock in the forenoon and three in the afternoon each day.

Subscriptions due to the Society will be received by the Finance Committee, at their department adjoining the public entrance to the Show-yard.

ROYAL AGRICULTURAL EXHIBITION AT CARLISLE.
RETURN TICKETS,
Available for 14 days, are issued for Windermere at Euston and the other principal Stations on the London and North Western, Lancashire and Yorkshire, and Midland Railways, at a little more than one Fare. Visitors taking advantage of this opportunity of seeing the English Lakes will find that trains are specially arranged to leave Windermere, so as to reach Carlisle at an early hour on the days of Exhibition.

Just published, second thousand, now ready,
HARRIET MARTINEAU'S GUIDE TO THE ENGLISH LAKES. Beautifully Illustrated, demy 4to, extra cloth gilt, 7s. 6d., fcap 8vo, 5s.
"It is the most complete Guide Book that has ever been published."—*Daily News.*

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
THE BEST PROTECTOR FROM THE HEAT OF THE SUN.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 108, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.
May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.
N.B. Sold in casks containing 14 or 7 gallons, at 2s. per gallon. Casks (which cannot be returned), 5s. and 3s. each.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

The Agricultural Gazette.
SATURDAY, JULY 14, 1855.

MEETINGS FOR THE ENSUING WEEK.
WEDNESDAY, July 18—Agricultural Society of England.

AGRICULTURISTS generally, and the members of the Agricultural Society of England especially, will hear of the death of Mr. PUSEY as of the loss of a friend. No one has done more of late years for the true interests of the agriculturist, and in no one of its members has the National Agricultural Society so justly and so fully placed its confidence. It has been through this Society chiefly that Mr. PUSEY's efforts for the agricultural good of his country have been made; but to his career in Parliament as well, tenant farmers generally look with gratitude. His efforts as a legislator on behalf of tenant right, more perhaps than any other labour of his public life, made him their leader, though we believe their gratitude is due even more for his purely agricultural career. His reports of agriculture generally, and of local agriculture in particular—his own contributions to the improvement of its practice and to the discussion of its theory, and, above all, the sober-minded judgment under which all the contributions to the Journal have been passed, so that under his editorship it has become the most useful and most instructive periodical that agriculturists have ever read:—these are what most justly bind the gratitude of British agriculturists to the memory of their friend and benefactor—PHILIP PUSEY.

GENTLEMEN! engaged as judges of field-implements at Carlisle; whoever you may be, we beg your attention on behalf of the great novelty upon which you will be called to adjudicate, that is, the STEAM-CULTIVATOR. While rejecting the presumption that steam-tillage can be "written up," or that the publication of vague generalities and undemonstrated opinions can materially help inventors to solve their difficulties, we hold it to be strictly within our province to point out the principles upon which your judgment should be based, and state the conditions

which a successful engine should fulfil. We attempt a commentary therefore upon the terms in which the Agricultural Society's prize is offered.

"Two hundred pounds for the steam-cultivator that shall in the most efficient manner turn the soil, and be an economical substitute for the plough or the spade."

"*Turn* the soil." Mark this expression; for the whole character and efficiency of the machine depends upon this point. Break up, loosen, and commingle the soil as much as you please, in preparing a seed-bed for any crop, but if weeds and Grasses be left still green upon the surface, if the seeds of our annual infesting enemies remain in favourable exposure to the vivifying sunshine and feeding dews, your tillage will be utterly abortive. On the other hand, if the ground be a stubble, bury every weed and withering stalk, and you promote its decomposition in the soil, making manure of what would otherwise injure as well as encumber; if it be a sward or a lea, still more urgently must you inter every blade and plant that might spring up amongst your intended crop. In the fundamental operation of tillage, the destruction of all remnants of the old crop, and the loosening-up of the staple for a succeeding one, you must "turn the soil." Was it not for this very purpose of burying obnoxious vegetation, and opening up a fresh surface of earth, that ploughs with mould-boards superseded the imperfect scratching instruments of yore? Is not the chief fault of the plough itself that it does not completely hide all surface vegetation, but too often (especially when the ploughman is blameable) leaves Grass or other living growth to shoot up from the seams of its furrows, and defy the weeder of the coming crop? For many tillage purposes—such as autumn cleansing or spring grubbing—no such inversion is needed; but in the first and foundation work of breaking up after a crop, and to the full depth of the intended staple, you *must* "turn the soil." Perhaps an instrument able to stir and mix every portion of a deep staple might be made to bring up repeated instalments of earth long buried, and thrust down the long exposed surface to take its place, at the same time forking out root-weeds and rubbish. As far as mere fertilisation is concerned, perhaps a frequent *commixing* of soil and subsoil might suffice, instead of alternate exposure of each upon the surface; but the consideration of weeds alone inculcates the necessity for "turning the soil." Therefore, we maintain that the first condition of the Society's offer is well chosen, and that the premium will be misappropriated in the opinion of practical men, if given to a machine (no matter how expert at comminution) that cannot entirely bury the surface.

Then it must be also "an economical substitute for the plough or the spade." If there shall be an engine that turns over furrows effectively at less cost than the plough—(first expense included) although it may be incapable of any other labour—give it the prize. And should there be a machine, unable to plough at all, but able to *dig* in as perfect a manner as men can with spades—if it will perform this work alone more cheaply than men, it is entitled to the prize. Ploughing ought to be accomplished for less money than by horses, and digging (though this of course is a more expensive operation) at less cost than by men. The judges have not to determine whether or not digging *à la* spade will be too expensive for the farmer although indispensable to the market-gardener; whether or not a cheaply-digging engine would not inaugurate miracles upon the clays; but (useful or not) *according to the terms of the offer*, they must award the premium either to an engine that digs more economically than the spade, or that ploughs more economically than our present horse-plough. Should a machine be produced of sufficiently versatile powers to execute both shallow work like a plough and deep work like a spade, such a doubly clever contrivance will of course merit the palm.

Before awarding the prize, and so pronouncing some invention to be an "economical substitute" for the implements with which we break up and invert whole ground—not merely for the grubbers and harrows with which we stir and pulverise soil already broken—let the judges well weigh this point of "economy." They must not sanction with the authority of the Society any machine that they dare not recommend to farmers or gardeners in place of the plough or spade. Besides the working expenses, they must calculate the wear and tear and the interest of the first outlay in purchasing the machine; and on the other side of the account they must be prepared with similar estimations of the charges for food, attendance, depreciation, &c., attaching to horses and common implements. On the credit side, they will have to compare the excellence or inferiority of the respective operations; and particularly they should fix a money value upon the *time saved* in the performance of the work, inasmuch as there is a great advantage in having a breadth of land prepared for sowing in less time than usual, though the acreage expense may be the same; and any means which (without incurring any neutralising disadvantage), gives the husbandman a greater command over his soil, and more independence of the weather, is certainly to be valued as a pecuniary gain.

Perhaps it may be unwise in the judges to trouble themselves with any further speculations as to the probable effects of displacing a considerable part of the farmers' teams, employing more or less labourers, &c.; as it has been generally found that when a new machine is worth having—the steam-thresher, for instance—all questions as to the disposal of surplus horses, &c. &c., regulate themselves very easily and speedily. Once furnish the agricultural public with a really "economical substitute" for anything, and depend upon it John Bull is too shrewd to let his love for antiquities prevent him from using it. *I. A. C.*

The statistics of dairy produce formed, as our readers will find in the following pages, the subject of a long discussion last Wednesday before the Council of the Agricultural Society. We have not room this week for the examination this report deserves, and must be satisfied with a single paragraph of comment. The ordinary experience of dairy farmers is what one needs to know before the value of Mr. Horsfall's practice can be ascertained; and testimony on this subject is so vague or so conflicting that a much larger number of witnesses are necessary than have yet appeared before a safe conclusion can be drawn. We have received from several correspondents information on the subject, to which attention shall be called next week; it bears out the opinion that Mr. Horsfall's average produce is above that of ordinary dairies, and that 262½ lbs. of butter is above the ordinary yield per cow per annum.

Mr. Scott, in his reply to our criticism, seems to think that his comparison of Kerries and cross-breds with Mr. Horsfall's cows is as fair as our selection of the short-horns from his table for that purpose: in this he is obviously wrong. Mr. Horsfall's cows must be compared with animals of the same sort before the merits of their treatment by him can be ascertained. And as a correspondent has reminded us, and Mr. Horsfall has himself so well developed in his Wednesday's paper, it is not dairy produce only—the condition of the cows must be noted also before the whole effect of his mode of management is perceived. We add to the information given in another page that the average of the returns furnished to Mr. Scott from 11 correspondents in England, and four in Ireland, represents the quantity of milk needed to produce 1 lb. of butter here as about 12¼ quarts, and there as about 12¾ quarts. Mr. Horsfall's milk yields a similar quantity from about four-fifths of these quantities, and his cows are gaining flesh and giving this rich milk abundantly together.

DAIRY STATISTICS.

Mr. Scott's communication on dairy management is the most interesting that I have read for a long time on that subject. It is indeed lamentable that this country, with the finest pastures in the world, and supplies of artificial food both in summer and winter far surpassing in abundance what are produced elsewhere, should be under the humiliating necessity of importing large quantities of superior butter, while much which we produce at home is unfit for our own consumption. Mr. Scott deserves the thanks of the agricultural world for having drawn public attention to so important a subject. Doubtless the ingenuity of our agriculturists in the dairying districts will be directed towards overcoming the evils of which he complains. One principal difficulty, however, will be found in practice to be the want of intelligence in the servants employed in the dairy. When a farmer's wife, with only half-a-dozen cows to to attend to, chooses to make up the butter herself, it will generally be of superior quality. But where from 20 to 50 cows are kept, this is, of course, impossible, and much must (even with the closest inspection) depend upon the servants employed. This it is which causes the butter in those counties which are not strictly dairy counties to be frequently superior to that made in those in which it is the staple product. The majority of the dairy servants are deficient in intelligence, in cleanliness, and general refinement. They think they have their dairy clean when in reality it is very dirty. They are unable to understand the absolute necessity of compliance with the rules given them by their master or their mistress, which they regard as mere whims or crotchets designed in part to give them needless trouble, and which they therefore evade whenever they have an opportunity. I know nothing so difficult to enforce as cleanliness upon a person not naturally inclined to it. It is first an instinct, then a habit; no series of injunctions or prohibitions will effect with a slovenly person what the innate sense of delicacy spontaneously does upon one of natural refinement. In dairy management, if very superior produce is required, one of two things usually happens with ordinary servants: either you get tired of them, or they find you intolerable. The cleanliness which you required is scarcely less odious to them than is their want of it to you. All this strongly shows the necessity for a modification of the education usually given to the poor. There is no social reform more important than this. Along with reading, writing, and other scholastic abstractions, teach a knowledge of things and impart practical instruction in the more important of those duties on which so much of the welfare of the poorer classes depends. If at any parish school the girls were taught to wash, to make bread, and the rudiments of dairy management and cookery, they would be insured a competency for life, as well as being made useful members of society. By learning such things on principle—by knowing something of the why which is at the root of what they practise, the routine of their lives would be less of a drudgery than now. Instead of looking upon labour as indignity only imposed by dread necessity, they would feel that pride in the skilful exercise of their calling which is the foundation of all success. The application of science to common things will in time make them cease to appear low or mean—but in this respect all classes have yet much to learn.

Mr. Scott, after mentioning Professor Trail's experiments on the proportion of butter yielded from a good quantity of milk by Kerry cows, Galloways, and Ayrshires respectively, says he "thinks, had the short horns been included, they would have come in last." Without pausing to inquire whether it is quite fair, by thus putting a surmise by the side of an experiment, to depreciate the butter-producing powers of short-horns, it is important to know in what sense Mr. Scott uses that term. There are three senses in which it is by no means uncommonly used: 1st, it is applied to the short-horns of the "Herd Book," formerly called the Durham or Teeswater cattle, and now frequently designated as "pure bred" or "improved" short-horns. 2dly, as used by London dairymen and others, it means the ordinary Yorkshire or Holderness cow. 3dly, in the midland counties the name is conferred upon any cow, no matter how bred, which happens to possess short horns. I have frequently been amused on walking through the feeding stalls of my neighbours at the comprehensiveness of the term as applied by them. I once inquired what breed a cow might belong to, whose appearance puzzled me, presenting as she did the character of a mongrel between half-a-dozen Welsh and Irish breeds, her colour being a dingy brown, her skin as thick as that of a rhinoceros, and her form such as I never desired to look upon again, when her owner informed me she was a short-horn! It is evident that the third sense in which this term is used is a very inconvenient one, including, as it does, not only Ayrshires and Alderneys, but every conceivable description of cross and mongrel which happens to have short horns. The majority of the cattle bred by the dairy farmers in this neighbourhood are descendants from Yorkshire cows, with sometimes a dash of pure short-horn blood, and a not unfrequent intermixture of other breeds too numerous to specify. They may be considered, therefore, as degenerate Yorkshire cows, which having been bred upon no principle (except the economizing of expense and trouble in their production) present all the faults of the stock from which they are originally descended, with few of their merits. Their general character is to be light-fleshed, though large consumers, their hair is scanty, colour pale roan or white with faint red or roan patches; horns short and very thin; they give a moderate quantity of rather poor milk, and they are rather below than above the average size. In short they are a description of animal which I thoroughly dislike, having nothing noble or generous about them. I believe that their milk would hold a low place in the percentage of butter which it yields; such at least has been my experience of the few cows of this description which I have happened to possess. With regard to the genuine Yorkshire or Holderness cow, it is generally admitted that she is more remarkable for the quantity than for the richness of her milk. In her favour, however, must be mentioned the remark of Mr. Mubura, that she gives milk of much richer quality in her native pastures than she yields under the stimulating system of the London dairies. The same high authority mentions a Yorkshire cow of his own, which yielded for some weeks after calving 15 lbs. of butter per week.

There is much evidence to show that the pure bred or improved short-horns, however much many individuals among them may through injudicious treatment have lost their milking properties as regards quantity, usually yield milk of a richer quality than their ancestors, the cows of Holderness. Mr. Berry alludes to the richness of the milk of several of his cows, and Mr. Youatt particularly insists upon the improved breed making up in this respect for the lesser quantity which they yield. That cows of high pedigree are frequently great milkers, I showed in my last communication to you. The evidence in support of this assertion accumulates upon me every day, and I hope soon to be able to publish a selection from it. With regard to the quality of their milk, I find it to be decidedly superior in richness to that of the ordinary cows of the country. Usually those cows which yield very large quantities of milk are deficient in the percentage of butter which is churned from it. But the cow Jessy, which I mentioned in my last communication as giving so much milk, is also a most superior butter cow. In propor-

tion as I have sold my ordinary cows, and replaced them by others with high pedigrees, I find that the richness of the milk has increased. It would be desirable if the experience of others were brought to bear upon this point—viz., the comparative richness of the milk yielded by the improved short-horns and the ordinary cows which commonly bear that name. As the experiment of Professor Trail shows the Galloways to give rich milk, it is by no means improbable that the cross with that breed which Charles Colling introduced into his short-horn herd may have contributed to perpetuate that quality among their descendants. I have never contended that the short-horns are not surpassed in single points by other breeds—that the West Highlanders, for instance, do not produce beef of better quality, the Alderneys yield richer milk, and the Ayrshires or the Holderness cows give more of it; but I maintain that there is no breed which, combining so many excellencies with the one in which it is unrivalled and unapproachable, early maturity, is equally suited to the general requirements of advanced agriculture, or as well adapted to improve the ordinary stock of this country. *Willoughby Wood, Holly Bank, July 8.*

Home Correspondence.

Orange Jelly Turnip.—In answer to "Colo," I beg to say that I have grown the Orange Jelly for the two last years, and consider it the best flavoured and most wholesome Turnip I ever tasted, it being as melting nearly as jelly, and I have found none stand the winter so well, not having lost one during the late severe one. They were in the early part of this spring as good as they were in the autumn. *R. C. B.*

D. Finney, Secretary and Actuary.

Mangold Wurzel for Breeding Sows.—As no one seems inclined to answer your correspondent "M. M's" inquiries respecting the injurious properties of Mangold Wurzel for sows, I will give him the little I know on the subject, as I was the first I believe that pointed out the fact, and got snubbed by one of your correspondents for it. The quantity of sows kept on this farm averages from 20 to 30; the young pigs are kept for porkers and sent to London weekly, and weigh about 8 or 9 stone. In 1846 we had a large quantity of long red Mangold, and a short crop of Swedes; thinking to make the most of the Swedes we gave the Mangold to the sows, beginning some time in November; many of the sows were then getting heavy in pig. All went on well for a week or two, when one after another of the sows slipped their young, and before the end of eight or nine weeks 12 or 13 had done so, when instead of giving them Mangold they had Swedes. I think only two slipped their pigs after the change of food. The roots were given raw, and this may be the cause, for when steamed and mixed with meal there is nothing I believe that will suit both the mother and young better. At the same time I may add that it has always been thought here a needless trouble to cook the food for sows till within two or three weeks of pigging. I am well aware that there may be many causes to account for this abortion besides the food, but as I took great pains to discover anything that would explain it, and could find nothing, I am bound to say that the impression on my mind is that it was nothing but the Mangold, and perhaps the error was in giving them raw. *E. X., near Braintree, Essex, June 26.*

Meteorological Summary for the Month of May, 1855.—Thermometer: Mean daily temperature in England, 48.3°; Ireland, 49.4°; and Scotland, 46°, being a mean of 47.9° for the United Kingdom. Rain: Average fall during May—England, 1.62 inches; Ireland, 2.27 inches; and Scotland, 1.49 inches, being a mean of 1.79 inches for the Kingdom. Wind: Prevailing direction in England, north-east, north, and north-west; Ireland and Scotland, north-east. Taking 17 localities, the following is the average number of days during the month of May that the following winds have prevailed—north, 4½ days; north-east, 8½; east, 2; south-east, 3; south, 2; south-west, 4; west, 2; and north-west, 4½ days. *H. Allnutt, Irish Land Schedule.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *July* 11.—Mr. MILES, M.P., President in the chair.

MR. PUSEY.—The Council received with deep emotion the announcement made to them, by Dr. Acland of Oxford, of the death of their distinguished member Mr. Pusey, whose name and labours will remain imperishably associated with the foundation, development, and successful progress of the Royal Agricultural Society of England, to whose interests, and to those of the agricultural community in general, his whole time and energies were so entirely and successfully devoted.

PARIS SHOW.—Mr. Evelyn Denison, M.P., the English Juror for Agricultural Implements and Machinery at the Paris Exhibition, reported to the Council the progress of the trials in that department. He informed the Council that the trials of the implements in Class 6 were postponed until the Cirencester meeting had taken place, namely, until the very end of the current month. The implements and machinery in this class consisted of portable steam-engines, threshing machines, brick and tile machines, chaff-cutters, mills, and (generally) all fixed machinery. Mr. Denison was glad to find that Mr. Fairbarn, of Manchester, was the chairman of that class, as that circumstance would give the English exhibitors an opportunity of direct communication with him, in explaining to him at once all the minutiæ of their respective machines. Mr. Denison could not deny himself the pleasure of expressing the satisfaction which Mr. Amos (of the firm of Messrs Easton and Amos, the Consulting-Engineers to the Royal Agricultural Society of England) had given to all parties, especially to the French exhibitors, by his professional abilities, and the fairness he had shown on every point connected with the trials.

RUSSIAN CATTLE DISEASE.—The Society has been favoured by the Earl of Clarendon with the following farther communications in reference to the alleged outbreak of virulent cattle disease in Russia:—

"Foreign Office, July 6, 1855.

"Sir,—With reference to my letter of the 26th ultimo, respecting the precautionary measures adopted by the Prussian authorities on the Polish frontier against the spread of the cattle disease, stated to be prevalent in Russia, I am directed by the Earl of Clarendon to transmit to you, to be laid before the President and Trustees of the Royal Agricultural Society, a copy of a despatch from her Majesty's Minister at Berlin, enclosing a report from the British Vice-Consul at Memel on the same subject.

"I am, sir, your most obedient, humble servant,

"WODEHOUSE."

"The Secretary to the Royal Agricultural Society, &c., &c."

(Copy).

"Berlin, June 30, 1855.

"My Lord,—With reference to my despatch, No. 246, of 23d inst., relating to the prohibition of importation of cattle, &c, from Russia across the Prussian frontier, I have the honour to forward to your lordship herewith copy of a report on this subject from her Majesty's Vice Consul at Memel, from which your lordship will perceive that there are doubts as to the existence of disease among cattle in the provinces adjacent to the district in which Mr. Hertslet resides, and that other motives may possibly have led interested parties to cause the importation of cattle into Prussia to be forbidden. I have, &c.,

"To the Earl of Clarendon. (Signed) BLOOMFIELD."

Extract from Mr. Vice-Consul Hertslet to Lord Bloomfield, dated

"Memel, June 27, 1855.

"The export of cattle from Russia meets with no obstacles from the Russian side, but merely from the Prussian authorities. Live cattle are compelled to go through a three weeks' quarantine at the borders, although the butchers have produced bills of health from the Russian authorities at the "Hauptman's Gericht" of Hasenpotf in Courland, and although it is a well-known fact that no cattle disease of any sort has been prevalent at any place near the borders for many years. There is a report that some disease had appeared at Johannisburg, the border town opposite the Prussian Stallapahnen, but this is not believed. I am informed that a Prussian official is about to proceed to Courland to make the necessary inquiries."

"According to official information the murrain (cattle plague) continues to advance from Russia towards the Prussian frontier. The Government has therefore, according to the instructions in § 3 of the Order, 27th March, 1836, resolved as follows.—[These instructions were printed in our previous report on the Russian cattle disease.]

"In order that these regulations may be duly observed, it is only allowed to cross the frontier in this district at the Custom stations of Nimmersatt, Bajohren, Laugallen, and Paschkenkrug.

"Memel, 28th May, 1855.

"The Provincial Counsellor,

(Signed) "DIECKMANN."

PHYSIOLOGY OF MILK SECRETION.—Professor Simonds, the Veterinary Inspector of the Society, delivered before the members a lecture "On the physiological conditions affecting the quantity and quality of milk secreted by the cow under different circumstances of feeding and management." Our space, on the present occasion, will only allow us to remark that the distinguished Professor, in this lecture, gave a masterly outline of this important and interesting inquiry; and, to use his own expression, "only skimmed the surface" of his subject. He presented, however, strong illustrations not only of the importance of his subject; but of its novelty to agriculturists generally, and of the extent to which the individual topics of inquiry would lead him, in order that full justice might be done to them: that "not only a single lecture, but a course of lectures" would be required for that purpose. The President, in requesting him to draw up a statement of his lecture for the Society's Journal, to be submitted to the Journal Committee, expressed to Professor Simonds his personal thanks for his great kindness in delivering that lecture, and his sense of the great ability he had displayed in its illustration.

PRODUCTION OF BUTTER AND DAIRY MANAGEMENT.

Mr. Horsfall and Mr. Scott favoured the Council with their own experience, arrangement of collected facts, and individual experience in reference to this important and interesting subject, and received the best thanks of the Council for their kindness in attending the meeting of that day, and the trouble they had taken for the purpose of elucidating the points at issue in the wide question they had endeavoured to elucidate.

I. MR. HORSFALL'S STATEMENT.

In continuation of my remarks of the 21st, and calling attention to the discrepancy noticed in the average yield of butter of 196 lbs. a year, to produce which would only require a daily yield of milk of rather more than 7 quarts per cow, whilst his average of 10 quarts per cow would reduce the quality of his milk in relation to butter one-third of that shown by his tabular results, I now proceed to examine the statistics supplied by Mr. Scott, with the view to show how far they affect those in my former statement, to which Mr. Scott has thought proper to compare them. The experiments on the Munster model farm had previously engaged my attention; a copy of the number of the "Albert Journal," in which they first appeared, was kindly supplied to me by Dr. Kirkpatrick, the intelligent principal of the Albert Training Institution, who will allow me to claim him as an agricultural acquaintance of some years' standing. The same number of the "Albert Journal" contains observations on the effect of temperature on dairy produce, which I had supplied at Dr. Kirkpatrick's request, and to which I shall have occasion to refer. I had some thoughts of introducing these experiments on the Munster model farm in my first communication to your Society, as showing the greatest average yield of butter in proportion to milk from a number of cows on ordinary food which had come under my notice. Finding, however, that these experiments had only been continued seven days, a time wholly inadequate to arrive at a safe conclusion as to what would be the result over a lengthened period, I omitted to introduce them. Mr. Cunningham, who supplied these statistics, accompanied them with the remark, that they are not sufficiently comprehensive, and that he should renew the experiments this season. From the attention I have given to this subject I have a right to give it as my opinion that the food is inadequate in one essential, that of maintaining the condition of the animal under a full yield of milk, and I hold it to be undoubted, that impoverishment of the condition of a milch cow will lessen her ability to afford the same quantity and quality of milk which she would give if her condition were kept up. The next experiments are Mr. Scott's own, but let me here observe, by ordinary treatment I understand bulky ordinary farm produce, whilst by high feeding, such produce together with dearer, more concentrated food. Now in looking over Mr. Scott's items of food, I observe in two an accompaniment of Oats; if he gave them a sufficient abundance they would complete the essential requirement I have mentioned, that of keeping up the condition, the main difference from my treatment being, that his food is more costly in proportion to its effect. In two others I observed bruised Furze, with the composition of which I am unacquainted, but if it answer the requirements I have named it will be strong food; it is certainly not ordinary farm produce. The next trial is on a Kerry cow, a breed which ranks first as a giver of rich milk; then a Galloway, also a rich milker; the remaining five trials taken together would furnish a very different average. In these seven trials no mention is made of the time under experiment, the description of food, season of the year, or of what I hold essential to a proper estimate of the effects of food, the maintenance of the condition of the animal. I may now say that having sought for information in the various treatises within my reach, I am not disposed to attach equal importance to these statistics of Mr. Scott as to those of the writers I have already quoted, and to which I will add Mr. Stevens, who in his "Book of the Farm" arrives at a like result with Dr. Muspratt, that 8 to 9 oz. of butter per day may be considered a fair average for a dairy cow. The following description of my own dairy results was written for the "Albert Journal" in January, 1855. The peculiar richness of the cream had then begun to call attention, and was under strict observation, but I had arrived at no conclusion as to its cause. I had not then any intention of laying it under the notice of your Society. "The dairy practice of this locality is directed to the production of milk for sale when new, or butter and skimmed milk. The price of new milk is nearly uniform, being 2*d.* per quart; that of butter is sometimes as low as 1*s.* per roll of 24 oz., and sometimes nearly double this. The price of skimmed milk is likewise steady, being generally 1*d.* per quart. The cause of the fluctuation in the price of butter with the steadiness of price in that of milk will be found in the comparative ease of the transport of the one as compared with the other: the former is liable to damage by moving, whilst the latter is regularly brought to market by sea and land hundreds of miles. Butter is brought from Mecklenburgh and from the west of Ireland to London. It will then be obvious that the supply of new milk is limited to populous districts, or to such as have gained easy access to them by the introduction of railways. It is in some measure optional in what way my dairy produce is disposed of—in new milk, or in butter and skimmed milk. In giving attention to this branch of farm economy, I was led at an early period to inquire at what price the two processes afforded a like return. After several trials made during warm weather, my cows being on Grass, with extra food, I found 16 quarts of milk yielded 26 oz. of butter: the quantity of cream varies with the skill or taste of the dairy-maid in skimming the milk, and in proportion as she mixes milk with the cream. I have frequently found a quart of cream to give 14 to 16 oz. of butter; the latter is about the average of the cream used for the trial churns at the Royal Agricultural Shows. With the observance of greater nicety in skimming, the cream being consequently thicker and richer, a quart may give upwards of 20 oz. of butter; if, however, the cream be wholly taken off, the yield of butter will in each case be about equal. The comparison will be—

			s.	d.
16 quarts of new milk, at 2*d.* a quart			2	8
16 quarts of new milk give a roll of butter of 25 oz., at 1*s.* 6*d.*	1	6	2	8¾
14¾ quarts skimmed milk, at 1*d.*	1	2¾		

(Half the quantity of butter milk covers the cost of churning).

Butter is sold here by the roll of 24 oz.: it is customary to make up the roll to weigh 25 oz., the odd one being in favour of the purchaser. I thus find an equal gain from new milk sold at 2*d.* per quart as from butter at 1*s.* 6*d.* per roll, and skimmed milk at 1*d.* per quart. It will scarcely be necessary to observe that with a rise in price above 1*s.* 6*d.* per roll, it is my interest to direct my dairy produce more to butter, whilst with a lower price new milk pays better. In the course of a season or two, and towards the close of a year (late in November), I remarked a considerable falling off in my receipts for the dairy: and as no change had occurred in the number or circumstances of my cows, nor in their food, I was led to inquire into its cause. I found an equal quantity of milk had been brought down to the dairy-maid, a like sum received for new milk, and that the deficiency arose solely from a less quantity of butter. With this change there had occurred a great change in the weather, it having become very cold and frosty. I again tested the quantity of milk, and found the yield of butter 16 oz. from 16 quarts, instead of 26 oz., as on the former trials: up to this time I had used an underground cellar in summer, and a room on the ground floor in winter, during which time this deficiency in my butter occurred. This room is situated on the north side of the house, the in door opening into the kitchen, where the culinary operations are carried on, and which door was usually kept close by day as well as by night. The room is lighted and ventilated by a trellis window, which gives free access to the frost and cold air. On trying the temperature I found it something below 40°; it then occurred to me that the deficiency of butter must arise from too low a temperature of my dairy, and an easy means of remedy at once suggested itself, namely, to introduce with a supply of fresh or cold water a supply of hot water, by an apparatus for that purpose. It so happened that the pipes for both hot and cold water passed through my dairy immediately under the trellis window, and over the stone table on which my milk bowls are placed. This table is about 2 feet in width, and occupies two sides and the end of the dairy in which is the trellis window. I ordered a shallow open cistern to be made of wood, with a rim about 3 inches along each side, and lined it with thin sheet lead; this cistern thus contained water of 3 inches in depth. At its extremity and near the window is a hollow plug having perforated holes, at least 3 inches above the bottom, and through which the water escapes as it rises into the common sewer. At the other end of the table, and inside the rim, is a pipe which, being inserted into the one from the hot-water apparatus, conducts this to a tap, and then returns along the other side of the table again to the hot-water

pipe; when the new milk is brought in it is set up when warm, and immediately the hot-water tap is turned, when the water flows from it and along the cistern in which the full milk bowls are standing till it rises to the height of the holes perforated in the tube, and then flows through the same. The tap is open so long as the supply of hot water lasts; when this is exhausted, and the water in the cistern has cooled, the plug is drawn, and the whole of the water escapes, leaving the cistern empty. At this season the trellis window is closed by a wooden shutter, and the in door communicating with my kitchen is kept open. By these contrivances my dairy attains a temperature in winter of 52° to 54°. I superintended the experiment when first tried one evening. The next morning my dairy maid thus accosted me: "Master, it is quite wonderful this morning, I have more cream from standing one meal than before from three." When the churning day came, the result was a yield of butter of 26 oz. from 16 quarts of new milk, being equal to what I had found in summer. Thus from a change of temperature solely and without any change of cows, or in their food, my quantity of butter was increased 50 per cent. But this is not the only advantage of the plan: I have already remarked, that along with the hot-water pipe, one with cold water passed through my dairy. At the approach of summer a pipe inserted into this with a tap close by that of hot water is turned, allowing the cold water to circulate in the like manner among the bowls of milk, till the cistern was filled to near 3 inches deep, when it again escapes through the perforated tube. This operation is continued through the hot weeks of summer, the tap being regulated so as to discharge a constant trickling of cold water, which is, of course, escaping through the tube at the other extremity, the milk bowls standing in water of the depth of near 3 inches during the whole of the summer season. I am thus enabled to allow my milk to remain two or three meals without becoming sour, and can sell it at the price stated, 1*d.* per quart. The advantage I gain from this is even greater than what I derive from the increased temperature during winter. These arrangements have been in operation several years, during which I have occasionally tested the yield of butter, and have always found it similar, varying only from 25 to 27 oz. from 16 quarts of milk, the greatest amount being observed in the month of December last, when it was found to be fully 27 oz. from 16 quarts. I may here remark that my milch cows are supplied in summer and in winter with food suited to their wants and to the office they are performing—the production of wholesome and nutritive milk. Since I adopted this mode of regulating the temperature of my dairy, I have read a lecture given before the Royal Society, by Captain Carr, an Englishman, who resides on an estate which he has acquired in Mecklenburg, in which country the produce of farming is chiefly directed to the production of butter, which is their main source for money returns, and where, as appears from Captain Carr's description, the arrangements of the dairy with regard to the production of butter are carried out with the greatest perfection, and in which regulation of the temperature is one of the chief aims. Captain Carr states that by artificial heat they effect a temperature during winter of 60°. Now, with my present means, I am not able to attain more than 52° to 55°; but as I have not during summer, when the temperature of my dairy sometimes exceeds 60°, found a greater proportionable yield of butter, I am led to conclude that the degree of temperature I have stated (52° to 55°) enables me to acquire the whole of the butter which the milk contains. I may here remark that my dairy produce is under such control that any considerable variation in the quantity and quality of my milk cannot escape observation for more than a few days. If my dairy treatment afford superior results to those in the treatises to which I have referred, I may be allowed to explain my views of the causes by which these are influenced. The principal one I take to be the affording to the cow an ample though (in consideration of cost, if not of effect also) not an excessive supply of each element of food, suited to her requirements, constitution, and purpose. The milch cow may be said to have a twofold occupation in using her food—the production of milk, and the maintenance of her condition. The former is the favourite one; if the food supplied be inadequate for both purposes, the defective elements are diverted to the milk at the expense of her flesh, fat, and probably of her bone material also. That I have effected this may, I think, be safely assumed by what I have already stated, namely, that my cows, under all circumstances, maintain and improve their condition. I do not insist upon it that the materials I am using are the only ones by which this desideratum can be effected; but I do think that its due performance is requisite to ensure the greatest and most complete produce from a cow, of which she is capable. The remarkable quality of the cream I am disposed to ascribe to the character of the vegetable oil, in which particular my winter food differs most materially from that commonly used. I find that butter on analysis varies considerably in its properties of murgevine and elain fats. I have seen this attributed to the difference of temperature of the season, that the summer butter contains more of the elain, the winter more of the murgevine property. In the month of April of this year, when conversing with Mr. John Simpson, of Ripley, a sober-minded observant farmer, whose repute as such has gained the attention of his rector, the Rev. Mr. Thompson, and also who consults him on his farming operations, he told me he and a neighbour of his who had observed my mode of treatment of dairy cows, of which they had found particulars in a publication to which I occasionally contribute, the *Gardeners' Chronicle*, had been surprised at the consequent change in the appearance of the cream and butter; he described it as being that from ordinary winter to rich summer butter. The difference in the consistency of cream on different pastures is very observable. Within two miles of this place is a small pasture at Wharfside, Otley, in the occupation of Mr. Garnett, which has long been noted for the richness and solidity of its cream. When I formerly travelled in Germany I well recollect on the road between Dresden and Töplitz, at a station near the boundary of Saxony, having been treated with rich milk and cream; it was evidently considered a rarity, as all guests, whether by Eilwagen, post or other conveyance, were invited to partake of it. The cream resembled in consistency and appearance the description I have given of that of my own dairy. I made the tour several times at intervals of some years, when the like treatment was afforded; it could only be ascribed to the peculiar quality of the herbage in the vicinity of Peterswaldau, which is, if I rightly recollect, the name of the place. I have now to state that at the present time, when my cows have become accustomed to Grass, and consume much less of the steamed food, there is a decided change in the quality of the cream; a jar which when filled so as to be conveniently removed from the dairy to the scullery, where the churning is performed, say an inch from the top, and which the twentieth quart of water will cause to overflow, yielded during the winter season 18 rolls 6 oz., gives only at present, from a like filling, 15 to 16 rolls of butter. The volume of cream is somewhat increased, but scarcely in the extent to compensate for the superior richness of my winter cream. I am thus led to think that the different varieties of vegetable oils influence the quality of the cream and butter. I now proceed to the consideration of the comparative pecuniary results of my treatment, and I feel called upon the more to do so, from observing that very erroneous views have been stated to your Society to the effect that the only result attendant on my treatment is the enrichment of the manure. To explain my views, I ask attention to the description of my food, which will be found in my former paper. The bulky farm produce alone will be scarcely admitted by practice to have the property which the chemist will concede, that of maintaining the condition of a store animal; it is less costly than the ordinary food supplied for the dairy purpose, and certainly not so efficacious. The extra food has too the like characteristics, a higher value in chemistry than in practice, and I here remark, that though I look on my neighbour's farm and watch his proceedings; though I have travelled to a distance with the like object, so that if I were to appear at Bainnesse, Beal, or on other farms across the Tweed, I should be recognised by the well-known occupiers as a former visitor in quest of information; yet in regard to the treatment of live stock the tendency of my experience is to strengthen my reliance on the chemical composition of food, and I now look to the analysis of an able chemist with greater interest than to the practice of others, or to the many feeding experiments which are yearly published. I now give you the results of my treatment on the different classes of animals, and commence with the cows for which I pay the highest price in proportion to their quality and condition, those near to calving. Now on comparing the price I have paid for some years back with that realised when sold, and taking into account the sum I obtain for the calf, which I sell when a few days old, and deducting 10*s.* for its keep, I find these cows fetch on an average more by 3*l.* to 5*l.* each than what I pay for them; at the same time I am purchasing from dairymen similar cows, but which have undergone impoverishment by ordinary treatment at less by 3*l.* to 5*l.* each than had been paid for them. I do not overstate the matter when I claim a gain in comparison with ordinary treatment of 6*l.* 5*s.*; if I allow them to average 50 weeks in hand it leaves 2*s.* 6*d.* for each, for the extra feeding. I also gain a saving in time; instead of a course of feeding which would be requisite to furnish the impoverished cow for the market, my cows are draughted off within a few weeks of becoming dry. At times my purchasers select them as fit for their purpose before they are quite dried, but beyond this I perceive an advantage in the quantity and also in the quality of my milk. I think it is not the least remarkable feature of my treatment that the milk from my stall or winter food is equal in quantity, whilst in the various experiments it has rather the advantage in quality as compared with that from Grass or summer feeding. Of the next class, the cows bought are in incipient calf, giving 6 to 7 quarts per day each, but which invariably increases on my treatment. I mention those of which I gave the weight when bought and after they had calved; these show a gain of 180 lbs. each, and which cost respectively 12*l.* 10*s.*, 12*l.* 12*s.*, and 13*l.* 2*s.* 6*d.*, would have readily fetched 18*l.* each, indeed I could not have purchased cows of equal quality and condition for this sum when near calving. I now mention another advantage of what is called high feeding of dairy cows, it enables me to milk them close up to calving time. I rarely dry my cows which I have had a sufficient time in hand to furnish them properly till within a month of calving; this gives me a month more for milking than I should think advisable with cows in low condition, a practice in unison both with experience and common sense. I now come to a third class—the cows which I purchase from dairymen giving a low yield of milk, say 6 quarts per day; in regard to these, I find, without exception, that with me their yield of milk increases in the course of a week or two about 2 quarts per day. These cows, being in a barren state, hold much better than when in calf to their yield of milk, and rarely get below 5 quarts per day when fat. Now, I have shown by weighing through a lengthened period, that with a yield of milk which will not average less than 6 quarts per day, they gain at the rate of 7 lbs. to 9 lbs. each per week. I think I may admit that the feeding of this class of animals is attended with profit; it exceeds much what I obtain from mere fatting. The cost of the auxiliary food which I am using, including that of coal and labour, will be about 3*s.* a week for each cow. I now call attention to the profit from manure which has been insisted upon to your Society, and responded to by conductors of agricultural publications, who, if they do not possess, ought to acquire the means of discriminating and calling attention to such statements as are sound and worthy of approval, as the only advantage that I derive from high feeding. Now, I entertain a different persuasion. I hold this advantage to be, comparatively speaking, a minor one. In my former statement I attempted to show what portion of the elements of the extra food which are of value for manure are carried off in the milk. In the class of full milk there will be little left for the enrichment of the manures, still there is something, as a cow maintaining her weight and condition will doubtless give richer manure than when losing flesh. In the other stages the comparative value of the manure is somewhat greater; yet, if I allow 3 lbs. per day of my extra food, or 21 lbs. per week, to go to the manure, and this is really more than I should feel satisfied with, the value of these 21 lbs., taking into account the loss by exudation, will, in manure, be about 6*d.* If we compute the value of manure from a cow under ordinary treatment as worth 1*s.* 6*d.* per week, and add the 6*d.* per week for extra food, the result will be 2*s.* per week, which is about equal to what I have found my cattle manure to be, on the analysis of Prof. Way. I cannot entertain or understand the teaching of those who insist that the only advantage of high feeding is one of manure. What does this amount to? Nothing less than that those who supply their animals with extra food, and amongst these may be comprised almost all the first class of farmers, are employing a ready means of converting their shilling into less than sixpence. It will be found that substances used as food, when deprived of their more valuable attribute, food for cattle, and retaining only that of food for plants, lose more than half their value, whilst if you convert them into milk, beef, or food for man, their value is increased in much greater proportion. I hold it then to be a sound theory, and one which I have sought to carry into practice, to convert my produce as much as possible into food for man, and to increase, rather than to enrich my manures.—THOMAS HORSFALL, *Burley Hall, July* 3, 1855.

I now supply the following particulars, with the view more clearly to explain the results of my treatment on stall or winter feeding. Two cows, which calved in September, the one a 3-year old light heifer, yielded soon after 14 quarts per day. The other, after her third calf, yielded at the rate of 18 quarts per day. In the month of June they were found to give respectively 10 and 14 quarts per day. Their weights were—

	Oct. 31st.			June 22nd.				
	cwt.	qrs.	lbs.	cwt.	qrs.	lbs.		lb.
Heifer ...	8	1	0	9	2	0	gain in weight	140
	9	2	0	10	2	0	" "	112

	Per week. s.	d.
Taking the former to have averaged 12 quarts per day at 2*d.*	14	0
Taking the latter to have averaged 16 quarts per day	18	8

The yield of excrement 5 cwt. 1 qr. per week, will be fully at the rate of 2*s.* each per week; the cost of the extra food may be assumed at 3*s.* 6*d.* per week each, as they would get more than an average. The milk of these two, tested by the lactometer in the month of June, was of superior richness. The gain in richness of manure, consequent on high feeding, I shall not estimate at more than 6*d.* per week. Two cows—one bought in September for 10*l.* 10*s.*, the other somewhat before for 12*l.*—each increased to about 8 quarts per day, and were continued in milk till the close of March, when their yield was reduced to about 5 quarts each per day. They weighed—

In September.	In May and June.
8 cwt. 0 qrs. 0 lbs.	10 cwt. 2 qrs. 0 lbs.
10 1 4	13 1 0

The former was sold in May for 18*l.* 10*s.*, leaving ...	£8	0	0
For milk during 24 weeks, 6*s.* per week	7	4	0
	15	4	0
The latter was sold in June for 22*l.* 1*s.*, leaving ...	£10	1	0
For milk during 24 weeks, 6*s.* per week	7	4	0
	17	5	0

The excrement would be richer, and its value may be assumed at 2*s.* 4*d.* per week. The enhanced value of the manure I shall not be disposed to estimate at more than 8*d.* per week, or for the 34 weeks 1*l.* 2*s.* 8*d.* The extra food will have cost at the rate of 3*s.* per week each. The ordinary farm food has consisted of—

12 lbs. of meadow hay each per week.
10 lbs. Bean and Oat Straw and shells of Oats per week.
32 lbs. roots, Mangold, &c., per week.

This ordinary farm produce will be found abou equal in nutritive property to what is found requisite to maintain the condition of the animals in store state and without other occupation. Will it not then appear that the other results are mainly derived from the extra food?

THOMAS HORSFALL.

II. MR. SCOTT'S STATEMENT.

5, Charing Cross, July 11.

In compliance with the invitation of the Council I have had much pleasure in meeting Mr. Horsfall at the Society's rooms to-day. At the same time I trust it will be clearly understood throughout this discussion that I have no personal feeling on the subject. I am committed to no crotchet, and have no theory to defend. I expected the paper read by Mr. Horsfall would have contained some new matter in further elucidation of his practice; but as this did not appear to my mind to be the case, I shall briefly address myself to his two commentaries on that part of my paper of the 30th of May which related to his reported practice. In those commentaries Mr. Horsfall appears to be more anxious to find flaws in my statement than to simplify and reconcile his own; for instance, I incidentally state that "an average cow will produce 196 lbs. of butter a year," to show the national gain that would be obtained on this quantity by raising the quality ½d. per lb. in price. Further on I state "that the average annual produce of a first-rate cow, well kept throughout a season of nine months, or 270 days, seldom exceeds 2700 quarts of milk, yielding 262½ lbs. of butter. This Mr. Horsfall utterly ignores, although the 262½ lbs. of butter is the point he should have dealt with. Mr. Horsfall further, in defiance of my stated figures, assumes that the 196 lbs. of butter is the produce of 300 days' milk. He thus increases my quantity of milk relative to butter, and thereby creates a disparity, favourable to himself of course, between his produce and that of other dairy farmers, which does not appear in my paper, and did not previously in reality exist. Mr. Horsfall must in candour admit that this 196 lbs. of butter forms no part of my case in which I deal specially with him, and that no mention of 300 milking days is made by me. The real and original question, as raised by Mr. Horsfall, is the scientific economy of his mode of feeding, and the amount of his produce. The announcement of a return of 25 oz. of butter per quart of cream led us at first to believe that he had exemplified in his practice, a system by which the ordinary dairy farmer could increase his profits. Investigation has proved this to be an entire fallacy. Mr. Horsfall's cows do not appear to produce more milk in a year than other ordinary well managed cows, and while from 10 quarts of his milk he extracts 15.78 oz. of butter, I have shown from the average of a number of trials in different counties—with different kinds of cows—under diversified management, and not got up for experiment, a produce of 15.68 oz. of butter from an equal quantity of milk.

	lbs.
His annual produce from a cow is	196.[illegible]
As against	264.[illegible]
Leaving in his favour on a single cow for a whole year,	1[illegible]

only. I abstained from taking the individual examples adduced by me, several of which I was personally acquainted with because the produce in several cases so far exceeds Mr. Horsfall's—thus, from 10 quarts of milk:—

One batch of cows yielded	19.70 oz of butter
Another	16.84 "
Another	22.00 "
Another	17.42 "
Another	16.32 "
5 ÷	92.28
Which, on an average, is	18.45 "
Whereas Mr. Horsfall's yield is only ...	15.78 "
Leaving him minus	2.67 "

on 10 quarts of milk. I merely recapitulate these data to show the logical absurdity of picking out from my paper 196 lbs. of butter, and after arbitrarily blending it with imaginary figures of his own, presenting the result as my case. The editor of the *Agricultural Gazette* pursues the same course when he remarks, "If the short-horns and the cross-breds are taken for comparison, Mr. Horsfall's yield of butter from the milk is one-third higher than the average of Mr. Scott." Now if the cross-breds and Kerries in the same table are taken for comparison, Mr. Horsfall's yield of butter from milk falls one-fourth short of my average; and if the cross-breds are taken alone, one-third. But further, while Mr. Horsfall's average produce of milk per day is not more than 10 quarts, yielding 15.78 oz. of butter, the produce of the short-horn in my paper is 17 quarts per day, yielding 18 oz. of butter; and of the cross-bred 10 quarts, yielding 22 oz. of butter; and in the case of the other two cows in Cheshire mentioned by me, the daily produce of the one was 40 quarts of milk, yielding 2 6-7ths lbs. of butter, and of the other 36 quarts, yielding 2 5-7ths lbs. of butter. Those are all rather extreme cases, and I merely mention them to show the disingenuousness of exclusively selecting those of an opposite character, to make out a desired case. The editor of the *Agricultural Gazette* also remarks, that "Mr. Horsfall's yield of butter from the cream thrown up is unprecedentedly large." True, but he should at the same time remember the fact that the quantity of cream thrown up is unprecedently small, being only 0.64 parts of a quart off 10 quarts of milk, whereas the ordinary extract is 1.27 quarts. Up to the present time we are therefore left to infer that the extra richness of Mr. Horsfall's cream may simply be the result of a little manual dexterity in skimming. Nor must it be overlooked that Mr. Horsfall's assumed annual yield of 3000 quarts of milk per cow (representing 295.87 lbs. of his butter) is not an ascertained fact, taken from a carefully kept daily register, but only an estimate "which he is disposed to think is not more than a moderate average on dairy cows properly maintained." If Mr. Horsfall brought forward the astounding fact of his having obtained 25 oz. of butter from one quart of cream, under the impression that this was the result of his special system of feeding, and that it was a new and valuable discovery, I think he must now admit that he was not warranted in coming to such a conclusion, and that I have shown that his produce of butter from milk is equalled and in many cases exceeded by ordinary dairy farmers. That such results as his can be obtained by certain modes of manipulating the cream, one of the numerous returns which I have obtained, and now submit to the Council, tends to confirm. By it I perceive that the average produce of butter in Devonshire from 1 quart of scalded cream is 22 oz., the milk required to produce this cream being 1[illegible] quarts. Mr. Horsfall has stated to-day that the experiments made at the Munster Model Farm last year, and quoted by me, extended over too short a period to be of reliable value, and that Mr. Cunningham, the manager, and Dr. Kirkpatrick, the Head Inspector of National Agricultural Schools in Ireland, had in consequence written him to say they would be repeated. They have been repeated, and by Dr. Kirkpatrick's permission, I have them here to-day. I visited both the National Model Farm at Glasnevin, and the Munster Model Farm, last week, and from the careful manner in which all the operations carried on are registered and attested, I think they may be relied on. Well, I find that the results obtained in 1854 are confirmed by those obtained this season, and that 9.67 quarts of milk produce on an average 16 oz. of butter, whereas it takes 10.14 quarts of Mr. Horsfall's cow's milk to produce 16 oz. of butter. I think these returns, from actual experience, will lead to more correct conclusions than the closet calculations of theoretical writers, and I therefore prefer them. I may here again remark, in acknowledgment for the Irish statistics, that though that country has not yet become a good school for practical farming, we are indebted to it for the many and carefully recorded experiments now being made at its agricultural seminaries under the Board of National Education on the principles and practice of farming. To show, however how little dairy farmers at present

know, or are willing to communicate about their business, the Secretary of the Royal Agricultural Improvement Society of Ireland lately put a series of queries on dairying in the Society's Journal at my request, and did not receive a single answer to them. Mr. Horsfall has the merit of having now set many dairy farmers a-thinking who might otherwise, all their days, have gone on mechanically; and he has also done good in personally devoting his time to the investigation of the principles of dairying. He must not prefer science to practice, however, but the reverse; and if he continue his experiments, I would venture to suggest that he must simplify the details of his operations and bring them into less compass; and then, when he obtains any useful results, the agricultural public will not fail to appreciate them. A balance-sheet would always be a useful accompaniment to these returns, and would enable us to judge whether or not his practice could be safely recommended to the ordinary rent-paying dairy farmer. Taking the data he has already furnished us with, and applying them to 100 quarts of milk, the account would stand as follows:—

By Mr. Horsfall's process.

Cream from 100 qts. of milk,	6.40 qts.	= 157.80 oz. of butter,	at ¾d. per oz. =	9s.	10½d.
Butter-milk "	"	1.92 "	at ¼d. per qt. =	0	0½
Skim milk "	"	87.30 "	at ½d. per qt. =	3	10¾
				13	9½

Average by ordinary process.

Cream from 100 qts. of milk,	12.70 qts.	= 156.80 oz. of butter,	at ¾d. per oz. =	9s.	9½d.
Butter milk "	"	7.60 "	at ¼d. per qt. =	0	2
Skim milk "	"	87.30 "	at ½d. per qt. =	3	7½
				13	7

Difference in favour of Mr. Horsfall, on 100 qts. of milk 0s. 2½d.

I must also remark that the butter shown by Mr. Horsfall to-day would not be considered first class in London; the colour and flavour were very good, but the texture was decidedly faulty, as I pointed out to him, being full of air cells, and requiring the application of the "pugging machine." In conclusion, the primary object of all dairy farmers must be to obtain the largest product from a certain number of cows and a certain quantity of food. Physiologically, some cows have a superior tendency to secrete and yield milk over others, just as we find one breed of cattle and sheep become fat on food that would hardly maintain other cattle or sheep in a stationary condition. In my communication to the Council of the 30th of May I have enumerated the most essential points to be borne in mind by the dairy farmer, and if these are carefully and punctually attended to they will generally ensure good management in the dairy.

THOMAS SCOTT.

P.S. I submit a specimen of the herbage, and a sod of the limestone pastures of Muckross Abbey, Kerry, and three specimens of coral and shell sand dredged in Bantry Bay, and usually applied to almost all crops in the southern and western coasts of Ireland. T. S.

At the request of the Council, Mr. Brandreth Gibbs undertook to ascertain the quality of the herbage Mr. Scott had brought over from fertile and barren dairy-land in Ireland; and Professor Way undertook to analyse it, as well as the mineral specimens with which it was accompanied.

The Council having received with thanks, and referred to the Journal Committee (along with Mr. Horsfall's and Mr. Scott's), numerous communications addressed to them by different members from various localities on Dairy subjects, adjourned to Wednesday, the 18th of July, at noon, when Professor Way would deliver his lecture "On the use of Fish as Manure."

Reviews.

The Journal of the Royal Agricultural Society of England. Vol. 16; Part I. J. Murray.

WE have as usual a very good number of the Journal. It contains 14 useful articles, the subjects of which are very fairly selected from the two great departments of agriculture, cultivation of the soil and the management of stock; and the more purely scientific relations of agriculture are expounded in articles by Professor Way, Mr. Trimmer, and Mr. Whitley; diseases of sheep and pigs—the comparative fattening properties of different breeds of sheep, and the characteristics of various breeds, especially with reference to their wool, are discussed in articles by Messrs. Seaman and Dunn, veterinary surgeons, Mr. Lawes, of Rothamsted, and Professor Wilson.

Experiments with manures for Turnips and for Swedes, and with reference to the feeding qualities of the produce, are described by Mr. Bourne, Dr. Voelcker, and Mr. Templeton. The causes of fertility and barrenness of soils are discussed by Mr. Coleman; a report on experiments on the growth of Wheat is given by Mr. Lawes; and continental farming, so far as observable on a hurried excursion to Hungary, is described by Mr. Love. Mr. Agate's prize essay on the autumn cleaning of stubble also finds a place in this Journal, and the whole number maintains the charater it had attained under Mr. Pusey's editorship. To the loss of the Society, owing to Mr. Pusey's serious illness, which has since, as our readers know, terminated fatally, allusion is made in the following postscript, with which we are sure every member of the Society will fully sympathise:—

"This being the first Number of the Journal which has not had the benefit of Mr. Pusey's active superintendence, the Journal Committee cannot send it forth without expressing their deep regret at the severe and protracted illness which still deprives them of his valuable assistance. They are also desirous of recording their high sense of the important services which, in his threefold capacity of chairman of the committee, editor, and author, he has conferred upon the Society and the country at large. From the very commencement of the Society the labours of the other members of the committee have been comparatively light, and it is right that the members of the Society should know to whom they are chiefly indebted for the success which has been achieved, for the reputation which the Society's publications enjoy in this and other countries. In their endeavours to maintain for the future the high standard of utility and interest already established, the committee wish to avail themselves of the active co-operation of the large body of practical and scientific men who compose the Society. Spread as they are over the whole surface of the British Islands, nor even confined to them, they possess singular advantages for the collection of information based upon observation and experiment. The Journal Committee therefore earnestly invite attention to the following resolution, which formed part of their last report to the Council, viz.:—'That in future, under the head of "Miscellaneous Communications," a portion of the Journal be allotted to short papers from such members of the Society as may favour the committee with an account of any matter of special interest which has come under their notice in the management of their farms, or in their immediate neighbourhood.'"

The intimation at the end of the above notice will, we hope, be influential in inducing the many intelligent men who read this Journal to contribute to its pages.

Calendar of Operations.

JULY.

BERWICKSHIRE MERSE FARM, *July* 2.—The cold dry winds of May disappeared with that month, and on the 1st of June we had refreshing showers, with a decided change to warm weather. This heat soon resulted in a violent thunderstorm on the night of the 6th, accompanied by a remarkably heavy fall of rain during two hours, which soaked the ground so that it could not be touched again for several days. Between the 15th and 20th we experienced a tract of weather, presenting one of those changes which have been so rife this spring. The wind blew cold from the east, with rain, and heavy hoar frosts at night, which somewhat injured the Potatoes. On the 21st the reaction was as sudden to the extreme of heat, with the night temperature at 65°, but since that the weather has been more moderate, with fine southerly breezes, but rather dry. On reviewing the past Turnip season we observe that the severe winter left our soil in a state little inferior to that of the preceding year, whence expectations were formed of a favourable tilth to help forward the work. These hopes were speedily realised on the lightest soils, but on *them* alone. On all classes of clay soils our experience has been severe labour and but indifferent results. On the 10th of May, for instance, we had just succeeded in reducing our first and strongest break to a pretty satisfactory state, when it came a day of steady rain, and our labour was lost; nay, worse than lost, for the new wrought land took rain very readily, and was reduced to a state of mortar, from which it never recovered. A similar mishap occurred with the break intended for Yellow and White Turnips, on the 6th inst. Seldom has the soil required so much work for the sole purpose of pulverising it. Old folks say that a good "body" of land requires two "furs" (ploughings) to prepare it properly for Turnips, but this year much of it has got three. The grubber makes but imperfect work here; for it is only on light land it can be said to fulfil its "mission." On all hands we hear complaints of the "fly:" its ravages have been extended even to plants in the rough leaf, for the Swedes made no growth till lately, and when at a standstill are particularly obnoxious to the attacks of that insect. Later sowings present a more satisfactory braird. Thinning is only begun in our immediate district, but our lighter neighbours to the west have been at it for a week past. We commenced cutting our seeds for horses on the 13th ult.; a very good crop, but at least three weeks too late. We intended mowing for hay next week. The hay crop will be exceedingly light, where not artificially top-dressed. Winter Tares have improved; they are certainly before the later spring sown, but will be of comparative little use where Grass is plenty. Wheat is strong, and the earliest is beginning to show the head. Barley has improved with mild weather. Oats are infested beyond all precedent, with Thistles and wild Mustard. Beans and Potatoes are rich-looking and healthy. Pastures where well planted (a *sine qud non*) have done very well all the past month, which has enhanced the demand for lean stock at our local fairs. Wool is looked on with confidence as a good speculation; some transactions having been concluded at higher figures than those current in the metropolis. It need scarcely be mentioned that the quantity of grain now in farmers' hands is next to nothing. *J. T.*

FARM NEAR HEXHAM, *July* 4.—If the month of May was unparalleled for its cold and barrenness, the warmth of the month of June has done much to make up for it. Since the favourable change noticed in our last report, we have had a continuance of just such weather as was required for bringing forward the backward crops and the parched and bare pastures. The change came too late to secure a heavy crop of hay; but both corn crops and pastures have made most satisfactory progress during the past month, and Grass is now abundant in the district, so that parties, who in the beginning of the month were bethinking themselves what they were to do with the stock they had, are now in want of more. Though we cannot now expect an early harvest, should weather continue at all favourable, it will not be a late one. Winter-sown Wheat is fairly into the "shot blade," and has every appearance of being fully an average crop, as also will the spring Wheat. Barley and Oats are both looking remarkably well; the fine tilth obtained for them at seed time gave them a hold they have never lost. The general opinion in the district seems to be that, if weather continue favourable, there will be a full average crop of all kinds of grain, and that harvest may be expected about the end of August or the beginning of September. Rye, which is grown to some extent on the lighter lands, has been in ear for ten days. While the weather has been thus favourable for Grass and corn, the frequent rains have made it a somewhat difficult matter to get Turnips sown in good condition, especially on strong and wet land, where there is still a considerable breadth to sow; and many will require to make bare fallow where they expected to have had Turnips. On dry and free lands the sowing is pretty generally terminated. We finished our Swede sowing on the 9th ult. (having been thrice stopped by rain in the process), and our Yellow and White on the 29th ult. The braird looks well wherever they were well got in, and thinning has been commenced; we began upon the 29th ult., and will require to be diligent to keep pace with the plants. Potatoes have come up with a fine healthy stem, and if they escape the now almost annual visitant—the blight—bid fair to be a good crop. Clover-land hay cuts up very light, but we hope from the rain we have had, and the barometer now standing very high, that we shall have a favourable season for harvesting it, and in some measure make up in quality for what we want in quantity. Meadows will be short. There was but a poor show of sheep at Stagshaw Bank Fair yesterday, and with the increased demand prices were considerably advanced from Whitsuntide fair. At the cattle market to-day there was not a large show of good animals, and anything fresh met with a ready sale at advanced prices. Two-year-olds sold from 10*l.* to 14*l.* 10*s.* and 15*l.*; yearlings from 6*l.* to 8*l.* 10*s.* Of Irish and black cattle there was a large show, with the usual amount of murrain. *T. P. D.*

Notices to Correspondents.

BONEDUST: *A Subscriber.* It weighs about 40 lbs. a bushel, varying considerably, however, according to fineness, dryness, &c., Your question about the quantity of dust needed to dry bones and acid, so as to form one ton, is not capable of answer. The bones and acid will dry of itself generally if left in a heap together and under shelter, but of course they may be made as liquid as you choose, and then need ashes or other absorbent materials to dry them.

ENTERITIS: *J W K.* Calomel and opium combined is a proper combination for enteritis, but not in such strong doses as you employed. Scruple doses every four hours are sufficient, and if the bowels are confined Linseed oil, but no stronger purgative. *W. C. S.*

FARM BAILIFFS: *F A.* Spring and autumn are the best periods for engaging the services of bailiffs. Though as they generally know that they shall leave, some time before they require a new place, they are to be secured at any time.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

HAY-MAKING MACHINES.

THE ROYAL AGRICULTURAL SOCIETY'S PRIZE MACHINES are supplied by WM. DRAY & Co., Swan Lane, Upper Thames Street, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ "	long 3 " 3 "		1	15	0
3 "	ditto 3 " 6 "		2	12	0
3½ "	ditto 3 " 6 "		2	18	0
4 "	ditto 3 " 6 "		3	5	0
2½ "	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto ditto	ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps

SCHOOL BOTANY; OR, THE RUDIMENTS OF BOTANICAL SCIENCE.

400 Illustrations. 8vo. Price 5s. 6d. half bound.

BRADBURY & EVANS, 11, Bouverie Street.

Lately Published,

THE ELEMENTS OF BOTANY, STRUCTURAL AND PHYSIOLOGICAL. With a Glossary of Technical Terms, and numerous Illustrations. 12s. cloth.

This completes the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12s.

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5s.

BRADBURY & EVANS, 11, Bouverie Street.

Third Edition, considerably enlarged, price 5s. 6d.

RURAL CHEMISTRY.

By EDWARD SOLLY, F.R.S., F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Hon E. I. Co.'s Military Seminary at Addiscombe, &c., &c.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

Price 3s. 6d., free by post,

THE TREE ROSE.—Practical Instructions for its Formation and Culture. Illustrated by 24 Woodcuts. Reprinted from the GARDENERS' CHRONICLE, with additions.

CONTENTS.

Annual pruning time, principle of execution, &c.
Binding up
Budding knife
Budding, time of year, day, time of day, state of the plant, care of buds
Budding upon body
Bud, insertion of, into stock
Bud, preparation of, for use
Buds, dormant and pushing
Buds, failing
Buds, securing a supply of
Caterpillars, slugs, and snails, to destroy
Causes of success
Dormant buds, theory of replanting with, explained
Guards against wind
Labelling
Loosing ligatures
March pruning
Mixture for healing wounds
Pruning for transplantation
Planting out, and arrangement of trees
Pushing eye, spring treatment of dwarf shoots from
Roses, different sorts on the same stock
Roses, short list of desirable sorts for budding with a pushing eye
Sap-bud, treatment of
Shape of trees
Shoots and buds, choice of
Shoots for budding upon, and their arrangement
Shoots, keeping even, and removing thorns
Shortening wild shoots
Stocks, planting out for budding upon; the means of procuring; colour, age, height; sorts for different species of Rose; taking up, trimming roots, sending a distance, shortening heads, &c.; saw proper for the purpose.

GRAFTING.

Aphides, to keep down
Free-growers, remarks on
Graft, binding up and finishing
Grafting, advantage of
Grafting, disadvantage of
Operations in different months
Preliminary observations
Roses, catalogue and brief description of a few sorts
Scion, preparation and insertion of
Scion, choice and arrangement of
Stock, preparation of.

APPENDIX.

A selection of varieties
Comparison between budding and grafting.

J. MATTHEWS, 5. Upper Wellington Street Covent Garden.

Price 3d. each, or 5s. for 25 copies for distribution among Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the office of the *Gardeners' Chronicle*.

In consequence of the new postal arrangements, parties in the country who desire it can have two copies sent by post for one stamp, five for two stamps, or eleven for four, in addition to the cost of the numbers.

THE COTTAGER'S CALENDAR OF GARDEN OPERATIONS.

By Sir JOSEPH PAXTON, M.P.

J. MATTHEWS, 5, Upper Wellington Street, Covent Garden.

Now ready,

THE FERNS OF GREAT BRITAIN: Illustrated by JOHN E. SOWERBY. The Descriptions, Synonyms, &c. by Charles Johnson, Esq. In One Vol. cloth boards, containing 49 Plates, full coloured, 27s.; partly coloured, 14s.

JOHN E. SOWERBY, 3, Mead Place, Lambeth.

Now ready, price 16s., cloth,

FLORA INDICA: being a systematic account of the PLANTS OF BRITISH INDIA, together with observations on the Structure and Affinities of their Natural Orders and Genera. By J. D. HOOKER, M.D., R.N., F.R.S. &c. and THOMAS THOMSON, M.D., F.L.S., Surgeon H.E.I.C. Vol. I. RANUNCULACEÆ TO FUMARIACEÆ, with an Introductory Essay.

London: WILLIAM PAMPLIN, 45, Frith Street, Soho.

THE PRACTICAL GARDENER, AND MODERN HORTICULTURIST; in One Volume, 968 pages closely printed, with upwards of 300 illustrative Woodcuts, comprising the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens; the Greenhouse, Hothouse, and Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. Bound in cloth, price 21s.; and also with Specimens of choice Flowers, coloured, 26s.

"The labour and experience of a life devoted to the science of horticulture we now present to the public."—*Vide Author's Preface.*

With an Appendix, describing a new and economical method of producing uniform bottom heat from hot-water tanks upon the most simple plan, with explanatory diagrams, and references to buildings now in successful operations.

London: T. KELLY; SIMPKIN, MARSHALL, & Co.

Now ready,

A LIST OF NEW AND CHOICE BOOKS recently added to MUDIE'S Select Library.

Also,

A LIST OF SURPLUS COPIES OF RECENT WORKS, withdrawn from circulation, and offered at greatly reduced prices for cash.

CHARLES EDWARD MUDIE, 510, New Oxford Street, London; and 76, Cross Street, Manchester.

CHEAP BOOKS.

SECOND-HAND COPIES of each of the following WORKS are now ON SALE at MUDIE'S LIBRARY.—

Lord Carlisle's Dairy, 5s.—Atherton, by Miss Mitford, 6s.
The Englishwoman in Russia, 6s.—Oliphant's Black Sea, 4s. 6d.
Heartsease, 5s. 6d.—Gilchrist's Life of Etty, 9s.
Avillon, by the Author of "The Head of the Family," 5s.

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a much more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions have been made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the principal changes are those which relate to vitality, climate, soils, ventilation, propagation, pruning, resting, and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the last edition has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that has been introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added a very considerable quantity of new matter, especially in the notes to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Just Published,

ARTHUR HENDERSON AND CO'S CATALOGUE. COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London.

No Agents. All orders are particularly requested to be sent direct.

POCKET NOOK, July 7, 1855.

BY HER MAJESTY'S

ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

Printed Price Lists sent on application.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers the nobility and gentry by whom they are extensively engaged.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; the Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

BEE HIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 5s., securely packed for the country.

This unique hive has met with universal commendation, and may be worked with safety, humanity and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without all injuring the bees.

Early applications addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of the improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

Agents:—Manchester, HALL & WILSON, 50, King Street; Liverpool, JAMES CUTHBERT, 12, Clayton Square; Chester, F. & A. DICKSON & SONS, 106, Eastgate Street; Glasgow, AVERY & M'ASLAN, 186, Trongate Street; Dublin, J. EDMUNDSON & Co., 61, Dame Street.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 17, Vincent Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, July 14, 1855.

THE GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE.

A Stamped Newspaper of Rural Economy and General News.—The Horticultural Part Edited by Professor Lindley.

HORTICULTURAL SOCIETY OF LONDON.—The unfavourable weather of the 11th inst. having caused large numbers of Exhibition Tickets to remain unused in the hands of the public, notice is hereby given that there will be a PROMENADE in the SOCIETY'S GARDEN on SATURDAY, July 28, for which all such tickets will be available.

On this occasion the BANDS of the COLDSTREAM GUARDS and FIRST LIFE GUARDS will be in attendance; and his Grace the Duke of Devonshire is so good as to permit the Grounds of Chiswick House to be accessible to the visitors.

The Society's Garden will be open at 2 P.M. on the day of promenade.

Tickets, price 2*s*. 6*d*. each, may be procured at the Society's Office, 21, Regent Street, or at the Garden on the 28th, price 3*s*. 6*d*. each.

THE SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.—The FOURTH EXHIBITION of the above Society this season will be held at the Horns Tavern, Kennington, on TUESDAY, July 31st, when Prizes will be awarded for the following productions, viz.: Miscellaneous Plants, Carnations, Picotees, Fuchsias, Verbenas, &c. An efficient Band will be in attendance. Admission to non-members from 2 till 7 o'clock. List of Prizes and the rules of the Society may be obtained from JOHN BUSHELL, Hon. Sec. *pro tem.* Lower Kennington Lane.

HEREFORD HORTICULTURAL AND FLORICULTURAL SOCIETY.—The days appointed for the SECOND and THIRD EXHIBITION of PLANTS, FLOWERS, and FRUIT this season are TUESDAY, July 31, and TUESDAY, September 4. Prizes open to all England. Schedules may be obtained on application to the Secretary.

WILLIAM PHILLIPS, Hon. Secretary.

BUCKINGHAM FLORAL AND HORTICULTURAL SOCIETY.—President, his Grace the Duke of Buckingham and Chandos, K.G.

The ANNUAL FETE of the above Society will be held on WEDNESDAY, the 25th of July, in the ornamental Grounds of George Nelson, Esq. The Committee have made extensive arrangements for the Exhibition of the various Flowers and Fruits produced by the competitors, and every encouragement will be given for the display of superior Vegetables, grown by Cottagers resident in Buckingham and the villages around. Three prizes will be given for Garlands. The unequalled Band of the 1st Life Guards, by the kind permission of Colonel Parker, will attend, as also the admired Brass Band of the Royal Bucks Yeomanry Cavalry.

The usual DINNER will take place in the Town Hall at half-past 3 o'clock precisely, when his Grace the Duke of Buckingham and Chandos, K.G., will preside; Frederick Edward Bartlett, Esq., Mayor, Vice-President.

The Festivities of the day will conclude with a GRAND DISPLAY OF FIREWORKS, the last piece of which will be a superb Military Device illustrative of the cordial alliance of France and England.

By the obliging attention of the Directors of the Buckinghamshire Railway Company ample accommodation will be afforded to the public by the arrangement of the Trains, of which full particulars will be given.

N.B. The Floral and Horticultural productions will be open for inspection at 12 o'clock on the payment of 1*s*. each person.

W. MARTIN } Hon. Secs.
H. THORP }

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

JOHN HARRISON, NURSERYMAN, SEEDSMAN, FLORIST, LANDSCAPE GARDENER, &c.

Plans and Estimates furnished; Experienced Gardeners recommended: also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, July 21.

GEORGE TAYLOR, JUN.,
CHOICE FRUIT and VEGETABLE SALESMAN,
St. John's Market,
Liverpool.
CONTRACTOR and PURCHASER of CHOICE GARDEN PRODUCE.
SALESMAN on COMMISSION.
Terms, Cash.
Forward as above.

STAINES'S SUPERIOR GARDEN TURNIP.—NEW SEED.—This Turnip is not stringy—free from knots—beautifully white, and very delicious as a table vegetable. It grows down into the soil, and is therefore protected from the action of the atmosphere, which causes the common Garden Turnip to become green and unfit for culinary purposes. Upon the receipt of Four Postage Stamps T. E. STAINES, Postmaster, Newport Pagnell, will forward (free) a Packet of the above Seed sufficient to produce 8 bushels of Turnips.—A liberal allowance will be made to the Trade on application to the above.

ROSES.

GEORGE CLARKE begs to announce that his fine collection is now in full bloom, and will continue so till autumn.—Streatham Place Nursery, Brixton Hill, near London.

ROSES.

JAMES MITCHELL begs to announce that his unrivalled collection of ROSES is now in fine bloom.
Piltdown Nurseries, Maresfield, Sussex, July 21.

WILLIAM WOOD AND SON'S COLLECTION OF ROSES is now coming into fine bloom, and will continue in perfection during the Rose season.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

LAKE TOURISTS AND OTHERS are respectfully informed that a Collection of all the most popular sorts of ROSES may be seen in fine bloom here.
JOHN GRIER, Waterhead Nursery, Ambleside.

ROSES.

A. PAUL AND SON invite inspection of the Collection of ROSES at the Cheshunt Nurseries, which is just coming into Bloom, and will continue to offer new objects of interest from the present time till the end of October. The best means of reaching the Nurseries is by Eastern Counties Rail to Cheshunt or Waltham Stations.
Cheshunt Nurseries (13 miles N.E. of London), July 21.

ROSES.

H. LANE AND SON, The Nurseries, Great Berkhampstead, have the pleasure to inform their patrons that their extensive Collection is now in bloom, and will remain so for some time. Their Coniferæ, Rhododendrons, and a general collection of Trees and Shrubs, also Fruit Trees (especially in pots, which can now be seen in full bearing) are remarkably healthy and well worthy the attention of planters. The Nurseries are within a few minutes' walk of the Railway Station on the London and North Western Railway, and an Omnibus from the station passes the gates.

CHOICE CINERARIA SEED.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior CINERARIAS, which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias have given for several successive years, enables them to recommend their Seed of the present season with much confidence. Packets sealed and warranted by them at 2*s*. 6*d*., free by post.
Exeter Nursery, Exeter.—Established 1720.

CHOICE CALCEOLARIA SEED.

J. DOBSON AND SON are now prepared to send out SEED of their unequalled collection of CALCEOLARIAS, in packets at 1*s*. 6*d*., 2*s*. 6*d*., 3*s*. 6*d*., and 5*s*. each.
Woodlands Nursery, Isleworth.

TO EXHIBITORS OF PELARGONIUMS.

J. DOBSON AND SON can supply a few Cut-down Plants of the New Pelargonium sent out last autumn, Beck's CONQUEROR, acknowledged to be the most distinct variety sent out for some time. Price on application.
Woodlands Nursery, Isleworth.

TRIFOLI ONION.—Seed of the true flat Tripoli Onion to be had of NUTTING AND SONS, SEEDSMEN, 46, Cheapside, London. The trade supplied.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. HENRY CLARKE, Seed Merchant, 39, King Street, Covent Garden.

THE "EMPRESS OF THE FRENCH" CUCUMBER is the BEST for WINTER CULTIVATION; now bearing abundantly in the Horticultural Society's Garden, Chiswick.—Seed supplied at ROGERS's Seed Depôt and Gardeners' Registry Office, Clock House, Chelsea.

SHILLING'S QUEEN CABBAGE, true as originally sent out, will not run to seed before cabbaging. Sow the third week of this month for spring use. 1*s*. per oz., free per post.—STEPHEN SHILLING, North Warnborough Nursery, near Odiham, Hants.—July 21.

GRAPE VINES FROM EYES.—This being a favourable season for planting Vines, and thereby saving a year, the undersigned has a large stock of all the leading kinds in strong plants, exposed to greenhouse temperature, which consequently enables them to be sent to any part of the country with perfect safety.—R. GLENDINNING, Chiswick Nursery, London.

HARDY AND SON, SEED GROWERS, &c., Maldon, Essex, are prepared to send to any address, free by post, their best selected kinds of CABBAGE and LETTUCE SEEDS, for July and August sowings, in one or four varieties. Also for early sowing, one or three varieties of their selected WHEATS, now in repute, sufficient for 1 rod, with directions, &c., on receipt of seven postage stamps for each variety, enclosed with an envelope properly addressed to its destination.

PRICED CATALOGUE OF PLANTS.

THOMAS JACKSON AND SON'S Priced Catalogue of Plants may be obtained on application. It contains Stove, Orchidaceous, Ferns and Mosses, Greenhouse, Ornamental Shrubs and Trees, Roses, and Herbaceous Plants.

T. J. & SON are offering at very low prices a large Stock of Azaleas, Camellias, Ericas, Epacrises, Helichrysums, Rhododendrons, &c., well deserving the attention of purchasers.
Nurseries, Kingston, Surrey.

PHLOX DRUMMONDI—PEARL.

JOHN HALLY, NURSERYMAN AND FLORIST, Blackheath, begs to announce that he has the above beautiful variety of PHLOX now for Sale. It obtained a Certificate of Merit at the Royal Botanic Society's July exhibition in Regent's Park. Colour, pure white, with a deep purple eye; is of very fine shape and substance. Plants 5*s*. each, with usual allowance to the trade.

PICNOPTERIS (OR ASPIDIUM) SIEBOLDI.

J. HALLY has a fine healthy stock of the above beautiful new Hardy Fern from Japan, described in the *Gardeners' Chronicle* for July 14th. It has proved itself perfectly hardy at Blackheath during the last severe winter. Plants 3*s*. 6*d*. each. Price per dozen to the trade on application.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS should be sown immediately after the hay is carried.

These Seeds consist of PERENNIAL CLOVERS *and* FINE GRASSES *for improving the bottom.* Price 9*d*. per lb., or 8*l*. per CWT. Eight or 12 lbs. per acre will be sufficient, and will produce a great increase in the produce.—SUTTON & SONS, Reading, Berks.

THE BEST SUBSTITUTES FOR SWEDES.

SUTTON'S PURPLE-TOP YELLOW HYBRID, SUTTON'S GREEN-TOP YELLOW HYBRID AND ORANGE JELLY TURNIP.—Prices, &c., will be forwarded, Post-free, on application (stating quantity required), by SUTTON & SONS, Seed Growers, Reading.

THE QUICKEST TURNIP KNOWN.

SUTTON'S EARLY SIX-WEEKS TURNIP.—*Good New Seed* 1*s*. *per lb., or* 6*s*. *p. gallon,* 45*s*. *per bush.* Carriage free except small parcels.
SUTTON & SONS, SEED GROWERS, Reading.

SUTTON'S IMPERIAL CABBAGE SHOULD NOW BE SOWN. *It comes in very early, hearts several times after cutting, and stands for two years before running to seed. Price of Seed,* 1*s*. *per ounce. Post free.*
SUTTON & SONS, Seed Growers, Reading.

J. DOBSON AND SON'S NEW DESCRIPTIVE CATALOGUE of PELARGONIUMS is now ready, and will be forwarded on receipt of one stamp for postage.
Woodlands Nursery, Isleworth.

SUPERB HOLLYHOCKS, SEEDS, ETC.

WILLIAM CHATER begs to offer packets of seed, consisting of 20 varieties, from his best Show Hollyhocks at 5*s*.; 12 varieties, 2*s*. 6*d*.; and from good double sorts, 1*s*.

Superior Quilled German and French Asters, in 12 varieties, mixed, 1*s*. per packet; separate, 2*s*. Fine Quilled African Marigolds, 6*d*. per packet.—Saffron Walden Nurseries.

HOLLYHOCK SEED.

A. PAUL AND SON have ready for immediate sowing a fine lot of HOLLYHOCK SEED saved from their choicest varieties which have obtained many of the leading prizes during the last three years:—

	s.	*d*.
1st selection, saved from 25 varieties, per packet ...	5	0
2d do. " 12 " " ...	2	6
Good Mixtures	1	0

Also, price 1*s*., AN HOUR WITH THE HOLLYHOCK.
N.B. Free by post, and payment received in postage stamps.
Nurseries, Cheshunt, Herts.

W. NICOL, GARDENER, Roslyn House, Hampstead, begs to announce that his new Pea "OMAR PACHA" may now be seen in fine perfection on application to him as above.

W. NICOL being desirous to afford ocular demonstration of the surpassing qualities of his Pea, had sown at same time "Daniel O'Rourke," and all the other new Peas recommended to him this season, all of which "Omar Pacha" leaves completely in the shade. W. NICOL is now open to an offer for the whole stock.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s*. per ton, 1*s*. 6*d*. per bushel, or 16*s*. per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2*s*. each. Kentish and other Peats and Loam of excellent quality.
KENNARD BROTHERS, Swan Place, Old Kent Road.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be [illegible] honestly worth 20*l*., without trouble, by sending 30 postage stamps and a directed envelope to Mr. WILLIAM FRANKLIN, [illegible]t-office Street, Norwich, who will forward it with plain instruc[illegible]ns, &c. This is a most extraordinary remedy, such as no Fa[illegible]er, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d*. per square yard; 200 yards, 14*s*.; 500 yards, 30*s*.; 1000 yards, 50*s*. Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

GARDEN NETS, FISHING NETS, AND SHEEP NETS, made by machinery, and sold at very low prices. Samples sent free. The old tanned nets repaired, 6*s*. 3*d*. per 100 yards.—R. RICHARDSON, 21, Tonbridge Place, New Road, London. N.B. Worsted Nets, to protect from Wasps, 7*d*. per square yard.

TENTS, MARQUEES, AND RICK CLOTHS.—Garden tents from 50*s*. each; large marquees on sale or hire, very cheap (100 feet by 30), 5*l*., small in proportion. Rick-cloths from 3*l*. each.—R. RICHARDSON, 21, Tonbridge Place, New Road, London. N.B. Patrol Tents, weight 12 lbs., price 25*s*. each.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, King's Road, Chelsea.

Printed Price Lists sent on application.

No. 1, Plain Syringe, with rose and jet, diameter of barrel 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.* No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 15*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, 21*s.* each. Large size, for Gardeners' use, 25*s.* each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

COTTAM AND HALLEN, Engineers, Founders, &c.,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each. Also choice CINERARIA seed saved from the finest named varieties, at 1*s.* 6*d.* and 2*s.* 6*d.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

PRIZE CALCEOLARIAS.—A few packets of seed saved from the group of Seedling Calceolarias to which a Prize was awarded at the Great Exhibition at the Crystal Palace, are now ready at 10*s.* 6*d.* each. These seedlings are unrivalled for immense size of flower, richness of colour, and strong vigorous growth. Seed from other Choice Seedlings at 5*s.* per packet.

Address to WILLIAM SANFORD, Gardener to Mr. Henchman, Edmonton, near London. No letter will be attended to unless enclosing a Post Office Order or Postage Stamps.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, July 21.

CALCEOLARIA AND CINERARIA SEED.

WILLIAM B. JEFFRIES, Arboretum Nurseries, Ipswich, begs to offer Seeds saved from his unrivalled Collections of the above, at 2*s.* 6*d.* and 5*s.* per packet each, which gained the three first prizes offered by the Ipswich Horticultural Society; likewise two extra prizes and a first class certificate; also the first prizes at Bury and Colchester. See "Cottage Gardener," June 19, page 212, which speaking of the Calceolarias, says, "they are all good, but No. 6, orange-laced with crimson, is one of the most beautiful in colouring as well as excellent in form we ever saw."

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE has again the pleasure of offering seed of his unrivalled collection of CALCEOLARIAS. From their well known merit, and many testimonials received in their favour, little need be said in their praise. Many of them can still be seen in bloom at the Nursery. Great care has been bestowed in the saving, so that none but first-rate flowers can be expected. Packets, price 2*s.* 6*d.* and 5*s* each.

Also CINERARIA, saved from none but the finest flowers and, like the Calceolaria, is warranted to give satisfaction Packets, price 2*s.* 6*d.*, payable in postage stamps or otherwise.

Streatham Place Nursery, Brixton Hill, near London.

THE NEW GERANIUMS AND VERBENAS
OF THE PRESENT SEASON AT REDUCED PRICES.

BASS AND BROWN are now enabled to offer strong and well established plants at the reduced prices annexed.

GERANIUMS.

	s.	d.		s.	d.
Dobson's Conqueror ...	21	0	Hoyle's Serena	10	6

Forster's Phaeton	21	0	„ King of Portugal	5	0
Foquett's Petruchio ...	7	6	Hockin's Una	7	6

Hoyle's Wonderful and Queen Eleanor, and Dobson's Silenus, will be ready to offer at reduced prices with our general list of Geraniums in October.

FUCHSIAS with white corollas, well established plants, at 3*s.* 6*d.* each, except priced, viz., Lucombe and Pince's Florence Nightingale, Galanthaflora-pleno, 5*s.*; Story's Queen Victoria, Mrs. Story, Snowdrop, Empress Eugene, Lady of the Lake, Water Nymph.

New FUCHSIAS of other varieties.—Bank's Prince Albert, 5*s.*; Climax, 2*s.* 6*d.*; Maid of Kent, 3*s.* 6*d.*; Beauty of the Bower, 2*s.* 6*d.*; Omar Pacha, 2*s.* 6*d.*; Smith's Omar Pacha, 3*s.* 6*d*; Orlando, 2*s.* 6*d.* The usual allowance to the trade.

For other new plants at reduced prices, see advertisements in the *Gardeners' Chronicle* of June 23d and 30th, and July 7th.—Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW AND SPLENDID ACHIMENES, ETC.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, is now prepared to send plants of the following out, post free, at the undernamed reduced prices:—

ACHIMENES (each).—Ambroise Verschaffelt, 5*s.*; Dr. Hopf, 5*s.*; Edward Boissier, 3*s.* 6*d.*; Edmond Otto, 2*s.* 6*d.*

Also the eight following fine varieties for 12*s.*, post free, or separate, at the prices annexed:—Achimenes Carl Walforth, 1*s* 6*d.*; Cherita, 1*s.* 6*d.*; Louis Van Houtte, 1*s.*; Gigantea, 5*s.*; Madame Randa'ler, 3*s.*; Mr. Parparet, 1*s.*; Sir Traherne Thomas, 1*s.*; Hendersoni, 2*s.*; Clianthus magnifica, 2*s.* 6*d.* each; Begonia Prestoniensis, Superb, 2*s.* 6*d.*; strong plants, 5*s.*; Eugenia Ugni, 2*s.* 6*d.*

Also all the new VERBENAS of this season, including Lady Lacon, Wonderful, Blue Beard, Lord Raglan, Mrs. Woodroffe, &c., 1*s* 6*d.* each, or 18*s.* per dozen, post free, for all of which see advertisement in *Chronicle* of June 23d, and previous numbers.

Post-office orders are respectfully solicited to accompany all orders (unless reference is given), payable at Marsden, Lancashire.

NEW CABBAGE.—THE CHAMPION OF ENGLAND, which has surpassed everything of its kind during the past severe winter (when nearly every other has failed) and turned well into Cabbage this spring. This Cabbage is of a very dwarf and compact habit, and quite equal in flavour to any yet grown. It has been in the hands of a very excellent gardener for several years, and he has thoroughly proved its superior hardy and good qualities. The stock of seed purchased is very limited, therefore none can be sold by the pound or in large quantities to the Trade this year. E. T. feels confident, from what he has seen of the Cabbage, that it will give the greatest satisfaction to all purchasers. Sold in packets of 1 oz., 2*s* 6*d.*; or of half an ounce, 1*s.* 6*d.*, postage free.

The TRUE OLD BATH COSS LETTUCE, which Lettuce has never been surpassed by any other yet grown. 1*s.* per packet.

☞ This being the proper time for sowing the following varieties of Hardy Flowering Seeds for blooming next spring, the following undermentioned varieties will give the greatest satisfaction to all purchasers as they have hitherto done for many past seasons:—

SWEET WILLIAM SEED—Saved from 50 of the choicest and most superb varieties. 1*s.* per packet.

ANTIRRHINUM SEED—Saved from all the striped, spotted, and finest shaped varieties. 1*s.* per packet.

Superb HOLLYHOCK SEED — Saved from all the best named flowers our last year. 1*s.* per packet.

SCARLET GIANT BROMPTON STOCK, extra fine. 1*s.* per packet.

PANSY SEED—A few packets from selected varieties. 1*s.* per packet.

AQUILEGIA OR COLUMBINE SEED—Saved from 12 distinct varieties. 1*s.* per packet.

☞ Either of the above packets of Flower Seeds three for 2*s.* 6*d.*

A remittance must accompany every order either in cash or penny postage stamps, when the whole, or any part of the above (as the case may be) will be forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

BEAUTIFUL NEW CONIFEROUS PLANT, "ARTHROTAXUS DONIANA."

W. MAULE AND SONS have much pleasure in announcing to the lovers of Coniferous and rare plants that after this week they intend sending out this beautiful tree from the Rocky Mountains, far south of Australia, which mountains are stated by their collector to be covered with snow, and inaccessible from ice nine months out of the twelve. This elegant evergreen tree has stood with little or no injury the two last winters, when at the same time Pinus insignis, Araucaria imbricata have been much injured, and many of our old evergreens quite killed close by their side. The stock of this rare plant is very limited. Established Plants, in 60 size pots, 42*s.* each.

Those gentlemen who have subscribed their orders, and may order this new plant, are respectfully informed that the strictest regularity will be observed in forwarding the strongest plants in rotation as their orders have been and are received.

Stapleton Road Nurseries, Bristol, July 21.

NEW AND RARE PLANTS.

JOHN AND CHARLES LEE have a fine stock of the following to offer:—

THUJA GIGANTEA.—A noble hardy evergreen tree, from the hills of California. From seed, 31*s.* 6*d.*; grafted, 21*s.*

THUJOPSIS BOREALIS.—A beautiful hardy evergreen tree from Behring's Straits. Grafted, strong, 21*s.*

CHRYSANTHEMUMS.—C. & Co. beg to state they have now published Catalogues of choice and new varieties of the above, and will be happy in forwarding it post-free to parties applying for the same.—London, July 21.

AZALEAS.

H. LANE AND SON, the Nurseries, Great Berkhampstead, have a very fine large stock of Indian Azaleas, consisting of Optima, Exquisita Perryana, and other leading varieties, at from 12*s.*, 15*s.*, 18*s.*, 24*s.*, and upwards, per dozen. Also a fine stock of young specimens, Catalogues of which may be had on application.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.

ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, July 21.

TO AMATEURS IN CONIFERÆ.

MR. BARRON, of Elvaston Castle, can supply a few strong PLANTS of PICEA NOBILIS, upwards of three years old, which have never been in pots, hence the roots are what they should be. The only Seedling Plants of this the most beautiful of all Firs) that have ever been raised since its first introduction to Europe. They will be sent out in the middle of September, the best plants to the earliest applicants. The largest size 63*s.*, and the next 42*s.* Notice will be given before the Plants are sent out, when a remittance will be required from unknown correspondents.

The Gardeners' Chronicle.

SATURDAY, JULY 21, 1855.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY, July 28—Promenade in Horticultural Society's Garden .. 2 P.M.

THE incessant heavy rain of the 11th, one effect of which was to leave somewhere about 4000 tickets in the hands of the public, has led to another meeting of the HORTICULTURAL SOCIETY at Chiswick. It will be seen from our advertising columns that, in order to enable the holders to use their tickets agreeably, the Society's Garden will be opened next SATURDAY for a PROMENADE, with military music. It is also announced that the Duke of Devonshire, the President of the Society, with that unvarying courtesy and consideration which are so characteristic of his Grace, has once more directed the exquisitely beautiful grounds of Chiswick House to be thrown open to public inspection on the occasion. Gardens near London are now in their freshest and gayest garb, and never can be seen to greater advantage; for, owing to the lateness of the season, we are at the point of contact between the verdure of spring and the glow of summer, so that should the weather be propitious, the usual exhibition under tents will be well replaced by a more natural exhibition in the open ground. A similar event occurred in 1844, owing to the same cause, and many must still remember how pleasant an afternoon was then passed in the shades of Chiswick.

We observe that those who do not already hold tickets will be able to procure them on very easy terms; and we learn that the usual orders from Fellows will, on this occasion, be dispensed with. This will doubtless be appreciated by that portion of the public which is obliged to distinguish between half-a-crown and five shillings.

THE season for importing DUTCH BULBS is fast approaching, and among these the HYACINTH always stands pre-eminent. Treatise after treatise, and directions upon directions have been published for the management of this plant, and yet people somehow fail more frequently than succeed with it. In the hands of the trade, indeed, no difficulty is experienced; but even there it is notorious that some growers are much more successful than others. So far as London is concerned, the exhibitions of the Horticultural Society have long since established the fact that in the Pine-apple Nursery collections are annually raised, which may be equalled, but are never excelled, either for the beauty of the specimens or the skill with which the best varieties are selected. Under these circumstances we shall incur no risk of being said to deal with a stale subject if we give a prominent place to some account of the practical management of the bulb, for which we are indebted to one of Messrs. HENDERSON'S most skilful foremen.

"As soon," he writes, "as we receive the bulbs from Holland, each is carefully examined, and all that are not perfectly sound are discarded. The remainder are brushed over with a soft brush, and replaced in bags for sale or for our own potting. We usually pot our first batch about the middle of September, and another in November; always in a compost consisting of one-half maiden soil (the top spit of an old pasture) and a similar quantity of a mixture composed of equal parts of rotten dung, leaf soil, and good sharp sand. This compost is turned over several times, till all the parts become thoroughly incorporated; then only is it fit for use.

"The pots we generally use are 5 inches and 6 inches in diameter. We find that in potting Hyacinths, the less the bulb is covered with soil the better, care being taken to press down the soil firmly with the fingers. After they are potted we

give them a good watering, and place them in beds 5 feet wide, where they are allowed to stand for two or three days, until the surface begins to dry, when old tan is thrown over them to the depth of 5 or 6 inches; and this is allowed to remain until the pots are quite full of roots, and the tops have made a growth of one or two inches. We then carefully look over them, and any that are not sufficiently rooted are replunged. Great care should be taken that they are not left in the tan too long; if they remain there till the leaves begin to open, the flower is very likely to be injured. Such as are well rooted we place in a cold frame, taking care to protect them well from frost, but giving them plenty of air every opportunity.

"If we want any in flower early in the season we prepare a hot-bed, taking great care to have the dung well worked previous to making up the bed. When the bed is sufficiently sweetened we place a few in it every week, to keep up a succession from Christmas till March, when the others will come on quite fast enough in the cold frame.

"Although most Hyacinths will succeed very well without artificial heat, many are greatly improved by it. Indeed, all that do not throw up their blooms kindly in the cold frame will be benefited by applying dung heat.

"The bulbs that are kept in the cold frame all the winter from the time they were taken out of the tan are generally in finest bloom from the middle of March till the second week in April. After that time they begin to fade.

"The following list includes 60 of the very best; and to have a grand display, and all the different shades of colours, no grower ought to have a smaller selection.

William the First."

We will not to-day divert attention from these excellent precepts by attempting to show how the cultivation on a large scale thus employed by Messrs. Henderson is susceptible of being imitated by amateurs. We would rather for the moment leave those interested in the management of this charming flower to reflect for themselves upon the principles which are involved in the successful practice now detailed. On an early occasion we shall endeavour to show how the practice may be varied on a small scale without neglecting in any degree the principles themselves.

In laying out a botanical garden the first questions which arise are how shall it be divided, what descriptions of plants, what different collections shall be admitted into it? In the common desire to have everything, even in gardens of the most limited means, there is also a tendency to exemplify every arrangement, scientific or practical, botanical, technical, agricultural, economical, or ornamental. Even in the larger establishments, where, owing to the liberality of governments the funds are, at first at least, ample, the ambition of the managers appears to grow with their means, and there is the universal attempt to multiply the collections, to do too much; in this, as in other respects, the smaller ones always striving to imitate the larger as far as they can. Let us consider separately the different arrangements thus attempted, in order to judge how far they may be really necessary or conducive to instruction, and which of them may be best suited for the smaller gardens.

In large establishments the following separate collections are frequently more or less aimed at:—

1. An Arboretum. 2. A general botanical collection of herbaceous plants, and this is sometimes in duplicate, being arranged firstly according to the Linnean classes; secondly, according to a natural system. 3. A special Flora of the district or country in which the garden lies. 4. A biennial collection. 5. An annual collection. 6. Œconomico-technical collections, arranged botanically, but collected into groups having reference to practical application, such as medicinal, alimentary, textile, tinctorial, &c., plants. 7. Agricultural and horticultural collections in which the botanical species are more or less lost sight of in the greater comparative importance of cultivated varieties. Such are collections of Cerealia, of fodder plants, of garden vegetables, of Vines, of fruits, &c. 8. A purely ornamental garden shrubbery and promenade, sometimes quite distinct from any of the above, more generally combined with the arboretum, sometimes blended also with the general herbaceous collection. 9. Plant-houses for stove and greenhouse plants. 10. Reserve and propagation gardens, including work sheds, etc.

In all botanical gardens where arborescent plants are admitted, it seems in every way desirable that they should be kept separate from the herbaceous collections. Trees cover a large space of ground which in a botanical border it would be necessary to keep bare, as few of the herbaceous plants to be associated with them would prosper under their shade. But wherever a portion of the garden is laid out as pleasure ground, the collection of trees can be scattered amongst the shrubberies and on the lawns without interfering with either, and can there be allowed to attain their natural size. It is a great mistake, however, including amongst these arboreta as part of the collection low shrubs and undershrubs, which can be inserted in their places amongst herbaceous plants without the slightest inconvenience, and are lost as specimens amongst the trees and large shrubs.

The general herbaceous collection is the important portion of the out-door department in a scientific botanic garden. It ought, generally speaking, to include in one botanical arrangement the several sets of plants we have enumerated, separate collections of which will be entirely superseded by a judicious selection of species for the main one. The method adopted for their arrangement should be that which may be recognised as the best and most instructive. The exemplification of artificial systems or obsolete classifications, matters of history or of mere curiosity, is useless in a botanical garden, as they can be illustrated and explained quite as well and at much less cost on paper or by means of dried specimens.

A separate collection of indigenous plants is not unfrequent in botanical gardens, but we never could see any advantage derived from it. It is never a fair representation of the local Flora, for, in the first place, it never is complete, or if it appears to contain nearly all the species supposed to be indigenous to the district represented, it will be found that a large proportion of the specimens have not been really brought from their wild stations, but raised from other sources; and, in the next place, from the altered circumstances in which they are grown, many of them lose their natural wild appearance. From these and other imperfections these living collections are far less useful for the identification of rare or anomalous wild plants than a good local herbarium or drawings taken from wild specimens, and are more costly, nor do they supply any data for the phytogeography of the district. Indigenous species should at the same time form a considerable proportion of the general collection, as they are mostly of easy cultivation, and degenerate less from their natural types than tender exotics. It may also be frequently desirable to cultivate for a time indigenous specimens for such purposes as testing the permanency of their characters, investigating special points in their structure, &c., but for such experimental culture the reserve ground is the proper place.

Separate beds for biennials or annuals are generally introduced more for the sake of saving garden labour than for any scientific object. Such as are wanted for science are best mixed in with the herbaceous collection, and the reserve ground is again the proper place for raising seedlings and annuals for the purpose of testing new importations, or other temporary objects.

Medicinal and some other special collections belong to some of the oldest of the botanical gardens, and are still fondly cherished in many of them. As botany was formerly taught chiefly as subservient to medicine, medicaments being then almost wholly derived from plants, the medicinal species were considered as the most important part, and often constituted the whole of the cultivated collection; and when afterwards it became the wish to cultivate hardy plants of every description, it was still thought useful to keep the medicinal herbs distinct for the benefit of the medical students. Upon the same principle we often find added to them separate sets of alimentary and tinctorial plants, and occasionally of textile and some other descriptions, which it has been considered might be practically useful in the different arts. But this separation never appears to lead to any useful results. There is no general habit by which plants of any of these descriptions may be distinguished from others. The medical, alimentary, tinctorial, &c., properties are found here in the leaf or flower, there in the stem or in the root, without ever betraying their existence by external characters. Each medicinal or œconomico-technical plant must be learnt individually, by comparison rather with its botanical allies in the general collection than with the stronger with which it may be associated, merely because the latter has also some perhaps totally different medicinal or technical property.

Agricultural and horticultural collections have no place in a purely botanical garden; they require a large space and a special culture; and if united with it in one large establishment, under the same general direction, still they require entire separation in detail, having nothing in common either in the end or in the means.

An ornamental promenade garden is, however, a really useful adjunct to a scientific botanic garden. It is attractive to the public, and keeps up an interest in the establishment. It is a place of rest to the student, and, as already observed, it combines well with the arboretum. It is also a convenient place for the summer grouping of the greenhouse collections, and for the permanent location of plants requiring such special cultivation as precludes the mixing them off in the herbaceous collection, such, for instance, as rock plants, aquatics, Alpine plants, peat-earth (or so-called American) shrubs, &c.

Plant-houses, pits, frames, propagation and reserve grounds, with work sheds and other appurtenances, are more or less necessary, according to the extent of the establishment. We sometimes find them scattered over the garden, sometimes wholly or partially separated. The hot and green houses for show or scientific use are, of course, best in the garden itself, where they can be, like the garden, freely open to the public; the propagation and reserve grounds, with their pits and frames, being necessarily private, should be quite distinct, and when out of sight are all the better, as not exciting needlessly the public curiosity. *G. B.*

It has been suggested, with reference to the Onion disease lately described in this Journal, that it would be well, if possible, for the gentleman who forwarded the case to secure seed from some of the diseased Onions, and distribute it to such persons as may be willing to try whether the crop will fail equally in other districts. We, at least, should be glad to make the proper experiments, but if any result worthy of attention is to arise, care must be taken to save seed from none but the most marked cases, and the bulbs should be committed to the ground as early as possible in the spring, as there would be increased risk of decay; if, indeed, it be possible to secure bulbs from such unpromising seedlings. The case is certainly worth attention, and we are glad to find that it has excited some interest. *M. J. B.*

New Plants.

137. Taxus Lindleyana. *A. Murray, in Edinb. new Phil. Journal*, i., 294.

"Leaves two-ranked, linear, flat, of smaller size and narrower than in the common British Yew (*T. baccata*, L.), and the prickle at the end of the leaf is more developed. Berries exactly like those of the Irish Yew, growing on the under-side of the branch. Seeds nearly globose, putty-coloured. Branches exceedingly long and pendulous. Wood almost as elastic as whalebone—a property which has been turned to useful account by the Indians, who make their bows of it. As I have only an imperfect specimen of the branch and seed, I am sorry that I cannot give more than the above very meagre description. The tree is from 40 to 30 feet high. One which my brother measured was 50 inches in circumference at 5 feet from the ground. Another at the same height measured 5 feet 10 inches in circumference. It was found growing on the sides of a glen under the shade of larger trees which grow higher up. It would consequently make a good filler-up where ordinary underwood does not readily grow. I have named it after Dr. Lindley, whose courtesy and kindness, both now and formerly, in examining for me and reporting upon specimens sent from abroad, I take this opportunity of gratefully acknowledging."

It has long been known that two sorts of Yew grow

in N. America; one an eastern weak trailing bush called *T. canadensis;* the other a western tree, supposed to be the same species. To these a Mexican sort was added some years since by Prof. Schlechtendahl under the name of *Taxus globosa*. Of the latter we have authentic specimens which seem undistinguishable from a plant gathered by Mr. W. Lobb in Oregon (No. 219), or from a Californian specimen, for which we are indebted to Mr. Murray, and which we suppose to be his *T. Lindleyana*. They are certainly very different from the common *T. baccata*, and we presume should also be distinguished from *T. canadensis*, but we doubt their distinction from each other. The subject is, however, one that demands further examination.

M. Carrière in his new work throws no light upon the question, but adds a "Taxus Boursieri," which is probably identical with the plant now before us.

MODE OF HEATING ADOPTED AT PORTHGWIDDEN, NEAR TRURO.

By the Rev. T. Phillpotts, F.H.S.

The accompanying plans and sections refer to a forcing-pit, Orchid-house, and cutting-frame, erected at this place, under my own direction, early in 1850. Their success has been so complete in all points that I place the details at your disposal, that others may, if they think fit, profit by my experience. Real usefulness rather than display has been my object, and I lay no claim to novelty or invention beyond what a practical rather than a scientific adaptation or modification of the plans of others, avoiding as far as possible their defects, may deserve.

Without discussing other systems, their merits and demerits, I will only say, that I have for many years paid much attention to the best method of constructing and applying heat (especially bottom heat) to horticultural buildings. The Tank system and the Polmaise have both been tried by me at different times (under the personal advice of Messrs. Rendle and Meek), honestly and without any prejudice; but after the expenditure of a good deal of time, trouble, and money, I have arrived at the conclusion that an apparatus consisting of hot water in pipes, with open troughs connected with them, affords the simplest and cheapest, because the most certain and efficient means of heating I have yet seen. The range consists of—

1. A forcing pit,* 42 feet by 8 feet, divided into three compartments A, B, C, of three lights each.

2. An Orchid-house of the same length, 10 feet wide, in two divisions.

3. A row of striking frames on the north side, to which heat may be given at pleasure.

The whole was put to work at Easter, 1850, when pit A was planted with Cucumbers (Cuthill's black and Snow's white spine I find the best), and since that time we have had a constant supply of the finest fruit, which has in every instance at five successive exhibitions carried off the first prize.

Pit B was filled with Vines in Pots, which were ripened and succeeded by Melons. In December a fresh lot of Vines was introduced, which produced the finest crop of Grapes (in pots) I ever saw. Some of the pots had as many as 14 and 15 bunches, well coloured. These were cut in May and June, from Vines which were most of them only 15 months old, and on their removal Melons were planted, of which there was (Sept. 29) a good crop, nearly ripe. Pit C has already ripened off a fine early crop of Melons, one of which obtained the Bronze Medal at the Botanic Society's exhibition in the Regent's Park. It is now occupied as a cool pit, with plants of various kinds.

The whole is heated by a single 24-inch ribbed boiler of Burbidge and Healey's pattern (they have in my opinion spoiled their newly improved (?) one by getting rid of the central tube). Perfect command of heat is given by the Sylvester fire-doors and dampers, which need no praise from me: they are admirable, and may be used with almost any boiler. The setting of the boiler, as recommended by Messrs. Burbidge and Healey, is a great advantage; the fuel does not come in contact with any of the iron work, every inch of which is, however, exposed to the action of the heat, and a system of slow combustion, regulated by dampers and by a flue, which descends a little before it goes off to the stack, economises fuel to a most surprising degree.

R, Roller for Blind.

The pipes are 4 inches in diameter, and 1 foot from centre to centre. The open troughs are cast with a pipe at each end to fit into the sockets; they are 6 feet long and 9 inches wide at the top; depth 4 inches, with a shoulder cast in each rim to enable us to cover them with common slate, when less moisture is required; if a very dry heat is wanted, a little sand strewed over the slate keeps all tight. The heat is regulated not by expensive cocks or valves, which contract the flow, and are liable to get out of order, but by series of cast-iron cisterns which supply the place of elbows, and being cast with one, two, or three sockets of the same bore as the pipes, may be plugged off with a common piece of wood, with a little cloth wrapped round it, so as to check or entirely cut off the supply from any part which may not need it.

I. Forcing Pit. II. Orchid House. III. Striking Pit.

[Observe that the pipes are below the external ground level; the entrance is by steps of slate, *over* the cross pipes, descending at once to the floor level. The shelves of the Orchid-house and the soil bed in forcing pits are formed of slate, supported by brick piers.]

Scale 1-8th. *South.*

B, Boiler. TT, Open Troughs. VV, Ventilators.

But the most perfect system of heating would be vain without good ventilation night and day. If my theory is correct, the air of plant houses of this description should be in direct proportion to the light, the moisture, and to the heat. This is best attained (where the quantity is easily controlled) in a small house, for the temperature must not be lowered too much by the admission of external air, while, on the other hand, it must not be dried by artificial heat. To obviate this difficulty, you will observe an air chamber between the two buildings, which has its opening at a lower level, near the ash pit; from this chamber several small drains open into the pits, &c. 6 inches above the floor, with gratings of (about 6 inches square) perforated zinc. From these a constant supply of fresh air in small and broken quantities arises, so that no strong draught is created; and this, passing over the surface of the pipes, under which it enters, loses its chill, while the open troughs supply it with moisture; these are constantly open, but may be closed if necessary. There are also ventilators in the front and back walls, and at the top of the Orchid house. It will be perceived that the ridge piece is raised above R, the roof, the south side of which carries a roller for sun-blinds, while the north side has a row of luffer boards, which are opened and shut at pleasure, by balance weights within. The front of the Orchid house is fitted with Hartley's patent rough plate-glass, which answers admirably without diminishing the light; indeed, a blind is still needed for the Orchids in very bright weather. One word as to drip—by adopting the pattern of sash-bar given by Mr. Lyons in his work on Orchids, this is entirely avoided, even when the house is saturated with moisture, and a cold wind blowing without.

It may be objected that the cold in this neighbourhood is not excessive, the thermometer never falling below 18°, and rarely within 10° of that point. I may, however, say that we have never worked to our full power, and my gardener is so convinced of the sufficiency of the boiler, that he wishes to heat another range of store pits from the same, which he says he could easily do with little or no increase of fuel.

With these observations I leave the plans in your hands, believing that with such modifications as circumstances may require they will be found practically useful and economical, getting rid in a great measure of the nuisance and uncertainty of dung beds, and doing the real work of the forcing ground in a simple and efficient manner. Such successful results can only be expected where the gardener not merely understands but loves his business. It is but common justice to add, that I have the good fortune to be so assisted, and that I highly value the care, attention, and zeal with which my plans have been carried out.

Note.—I must not omit mention of the Cucumber pits erected for Mr. Ludlow, at Heywood House, Wilts, from which I received much assistance, and, indeed, the first idea of my own range. They failed, however; at first from an excessive moisture, caused, as I believe, by an insufficient supply of air. I have no doubt Mr. Crane, the intelligent gardener, has long since remedied this. It may be useful to add that the entire cost of my building, including everything, was 160*l*. The consumption of fuel to keep it constantly working is about 9 tons of culm (price here 14*s*. per ton) per annum.—*From the Journal of the Horticultural Society*, vol. vii., part 1.

* The pits are really only 6 feet wide, but in the drawing I have made them 8 feet, as I find I have such a superabundance of heat that I now wish for the extra width. This is the only improvement I can suggest, after a fair trial.

VEGETABLE PATHOLOGY.—No. LXXXI.

339. CAPSOMANIA (*Multiplication of Pistils, &c.*).—Under this head I include those constitutional and organic changes which affect the carpels and ovules. These may exist either in a single branch or in every part of a seedling; but as every bud may be considered in a certain sense as a distinct individual, and peculiarities which take place in a single bud may often be propagated, there is no inconvenience in considering both cases together as essentially constitutional. It is not uncommon, for instance, in the Apricot to find blossoms with more than one pistil, and in consequence twin fruit occurs, and there is a variety of Peach in which such fruit is constant. A branch of a Plum is figured in *Gard. Chron.* (1852, p. 452) in which three or more pistils are present, varying however in number in the several flowers. As these were produced on a Midsummer shoot, there was no probability of the fruit coming to perfection, and the flowers were accordingly sacrificed with a view to ascertain their structure. Other instances occur of the production of more than the ordinary number of carpels, as in those leguminous plants in which a single carpel is almost universal; and again in Umbellifers, where the number of carpels is as constantly two, a third is sometimes added; and, indeed, not unfrequently in Heracleum sphondylium. The variety of Wheat known under the name of Mummy Wheat exhibits a multiplication of the spikes by means of elongation of the axillary buds of the glumes, and that in such perfect keeping with the rest of the plant, that there is no deficiency, but on the contrary an increase of produce.

340. Carpels may be multiplied, not only in the same plane, but in more planes than one, as in the Pomegranate. Pears are not unfrequently distorted from the addition of numerous carpels on the upper part of the axis. Several instances are figured in *Gard. Chron.*, 1851, p. 723. Such a structure may obtain normally, but in the curious conditions of Sweet William and Foxglove mentioned above, it accompanies other morbid phenomena, the carpels which are produced from a whorl higher up the axis being totally different in structure from that in which they are contained. We have, for instance, central and axillary placentation in the same plant; and again we have free parietal placentæ, and axillary placentæ, combining, in fact, the characters of Figworts and Gesneraceæ in one and the same capsule of a Foxglove, The only difference between these cases and that which is normal in the Pomegranate, and takes place occasionally in other Myrtads, consists in the greater compactness of the fruit of the latter, in consequence of which the structure becomes a little confused.*

341. The ovules are subject to morbid changes no less than the carpels themselves. They may revert to their original form of leaves, or they may consist of a whorl of leaves, and thus produce distinct carpels. In the Sweet William, Foxglove, and Carnation, to which we have so often alluded, there is either the rudiment of a stigma, or one to each carpel of the transformed ovules in a very perfect condition, the placentation in the two former cases being uniformly and decidedly parietal. This peculiarity, moreover, is not confined to a single flower in the case of the Carnation, but in the original flower, as in many plants derived from cuttings, every capsule is more or less affected, insomuch that it is quite hopeless to look for seed. Ovules occur, also, on transformed organs as stamens and petals. In the Gourd mentioned above, they were produced abundantly on the anthers instead of pollen, and in a double Barbadoes Lily (Amaryllis hippeastrum) figured in Lindley's "Theory of Horticulture," they are produced on the sides of certain doubtful threads representing either petals or stamens.

342. The component parts of the ovule when advancing nearer to maturity are not exempt from distortion and change. The raphe, for instance, in the Melon is sometimes immensely swollen, and the cotyledons at the same time are so over-nourished that they burst through the integuments though capable of affording a considerable degree of resistance.† It is to some peculiar diseased condition, too, that we must refer those cases in which the embryo germinates while yet within the fruit, and not only are roots put out, a circumstance which I have myself witnessed, but the plumule increases, makes its way through the integuments, and is developed into a strong shoot, a circumstance which a few years since caused a considerable degree of excitement in Germany, though in reality not near so marvellous as many vegetable phenomena with which we are all familiar. *M. J. B.*

* See Lindley's "Vegetable Kingdom," p. 457 and 735, where several other instances are mentioned or illustrated.

† I have observed this to be the case in the capsules of very double varieties of Balsams.

ALLAMANDA GRANDIFLORA.

WHEN well grown and flowered this is one of the handsomest of the Allamandas, and it is not very difficult to manage. Let us begin with a young plant in a 5-inch pot, bought in spring from the nursery. Such a plant, if in good health, will in general be found to be what is termed pot-bound. The first operation, therefore, under such circumstances, will be to turn it out of the pot, remove the crocks, and carefully to disentangle the roots. If the latter are healthy, give rather a liberal shift,—say into an 8-inch pot, using a mixture of one-half good fibry loam, one-quarter peat and one-quarter leaf-mould, with a little sharp sand. Experience has proved that a soil of this kind, well mixed, and chopped up with the spade (not sifted), on an efficient drainage, suits it perfectly; but if peat cannot be had, then three-quarters loam and one-quarter leaf-mould and sand might answer. In both cases, place a layer of some of the most fibry and rough soil over the drainage, with a view to make the latter act perfectly and permanently.

After potting, give a thorough watering, to settle the soil about the roots, and place it in a smart bottom-heat in a moist stove. When it shows symptoms of breaking, if the plant is weakly or drawn, cut it down to a prominent bud on the ripe wood, or in the case of a stronger plant, bend it down, in order the better to equalise the flow of the sap, and cause the buds at the bases of the shoots to start simultaneously with those at their tops. Judicious watering and occasional tying will now be all that it will want, until it has filled the pot with roots and requires a shift, which will probably be some time in June; for it must be remembered that it should not be allowed to blossom the first year. The point to be kept in view is, to have a good strong plant furnished in autumn with well-ripened wood, from which abundance of bright yellow flowers may be expected the following season.

About the beginning or middle of June, if all has gone on well, it will be found to have filled its pots with fine healthy roots, and should be shifted into an 11-inch pot, using the same compost as before. After shifting, continue the generous growing treatment already recommended, until the end of autumn is approached, when water should be gradually withheld, and all the light and air that is possible given it, to ripen the wood well, an important point in the culture of all plants, but more especially so in that of the Allamanda. Keep it all but dry during the gloomy months of early winter, and about the middle of February start it into growth. Prune the unripe tops off the old wood; and if a large and fine specimen is desired shift it when it begins to break, and plunge it again into bottom-heat. Train the branches well out on a barrel-shaped trellis, which may consist of seven or eight nice hazel rods, of sufficient length, placed in the soil immediately inside the pot, fastened to a hoop about their middle, and then to a smaller hoop at their top. Bend the shoots of the plant round this, so as to cover it regularly; and when the young branches have begun to grow freely, train the strongest of them near the bottom of the trellis, so as to have your plant regularly covered with flowers, which it will be by the middle of July if the foregoing directions have been carefully carried out.

In the third and fourth years it will flower earlier and better than in the second, and it will not require to be shifted; but it should be fed occasionally with clear liquid manure water, to keep it healthy and vigorous, without being over-luxuriant. By liquid manure I mean clear weak dung-water from the stable-yard. *Alpha.*

Home Correspondence.

Mixed Hedges.—Is Beech the only plant you would select for this purpose? Surely the evergreen Privet is vastly superior, not only in appearance but in density; nothing can well be uglier than the dead, brown leaves of Beech. It is a perpetual *memento mori*, from which the eye would gladly seek relief in the refreshing verdure of the Privet. As to whether a fence is better mixed or unmixed, doctors differ. The rationale of the matter I take to be this—where Whitethorn will flourish *per se*, why mix anything with it? Let well alone; but if you must have a mixture, let it be something sightly like Privet, not ugly like Beech. The thickest and best fences I have ever seen and grown have been of Privet and Whitethorn in about equal parts. *Samuel Taylor, Gloucester.*

The Cactus House, Kew Gardens.—I am a great admirer of succulent plants, and as such often pay with much pleasure a visit to the above place, which I presume I may say, without fear of contradiction, is quite unrivalled in quality or extent. Last week I was much struck with the altered appearance of the place; the plants at the back of the house had been raised perhaps a foot or more, the improved effect of which is most remarkable, in fact many of the plants (though very familiar to the eye from year to year) one could hardly believe to be the same under the new arrangement. I have no doubt hundreds beside myself have been struck with this manifest improvement, which I consider reflects great praise on those who have planned and carried it out; and, as I heard a lady remark, this house is now the "gem of the place." There is yet, however, remaining one thing very objectionable, and that is the Lycopodium edging—this might be removed, and replaced with some of the common dwarf-growing succulents, some of the greenhouse varieties of the common "Stone-crop," or similar things, which would require treatment nearer the Cactus than the Lycopodium, and would harmonise better with the general effect of the house. It is a fact too well known to require any comment, that succulents will not harmonise in appearance with any other kind of plants. I throw this out as a suggestion which, if found practicable, I feel assured will be carried into effect, as certainly it can be said of this establishment (unlike most others belonging to the nation) with truth, that the "road to improvement is always open and free." *N. Burgess, Hackney.*

New Rat Trap.—After the lapse of something like a quarter of a century, I felt not a little amused at the re-appearance in your pages of an old sketch of mine, headed as above. Its history is briefly this. The merit of the invention is due, not to me, but to my excellent and ingenious friend the late Robert Paul, of Starston, in Norfolk, who had, as many besides myself will remember, a peculiar turn for this species of knickknackery; delighting in nothing better than circumventing, in every possible and impossible way, what may be called the natural enemies of the farmer, from the flies in the Turnip field to the rats and mice in the homestead and rickyard. As a neighbour, I had frequent opportunities of seeing his inventions; such of which as pleased me I had his full consent to adopt; amongst others, what he called his "rattery," a plan of which I subsequently made for my late friend Mr. Loudon, in whose "Encyclopædia of Agriculture" it first appeared, and afterwards in his "Gardeners' Magazine;" perhaps, too, in the "Farmer's," but that I forget. This is the new rat trap, of which you have made such honourable mention, and in whose praise, though in some degree a party concerned, I can from experience most conscientiously join. *Samuel Taylor, Gloucester, July* 16.

Fruit of Rhododendron javanicum.—I have this morning detected Rhododendron javanicum in the act of throwing off that extraordinary great-coat which I described to you on a former occasion, and I enclose you a pod in that condition. It is so sensitive to drought that it may come off and shrivel before it reaches you. The ripening of the seed pod takes place a week or ten days afterwards—at least it did so two years ago—and the pod itself is so hygrometric that it will split within half an hour after being gathered in warm or dry weather. When divested of this exterior coat the pod resembles that of ordinary Rhododendrons. On gathering the pod I see it shows signs of splitting at once; generally the coat comes off some days previously. *John Rogers, River Hill, July* 9. [In this case the shell of the seed pod (capsule) separates into two plates—the outer leathery and deciduous, the inner hard, dry, and hygrometric; the former is analogous to the two-valved rind of the Almond, &c. Something of the same kind occurs in R. Edgworthi, and a precisely similar peculiarity is found in an unnamed Rhododendron in our herbarium, collected by Griffith in Malacca. It is, moreover, to be observed that all Rhododendron capsules have the same great-coat; the difference is that in some it is thick, in others thin, and that some throw it off and some do not.]

Ineffectual Puddling.—I have had to contend with this difficulty for upwards of 15 years. My subsoil, like that of your correspondent's, is gravel, the pond or pool is from 2 to 3 feet deep, and lined with strong blue clay 1½ foot thick all over the bottom and up the sides to the surface of the ground. In order to impart firmness, I beat down upon the clay the thinnest flagstones I could fall in with, and laid the joints as close as possible, still the water sunk, say, about an inch a day; and the pond being supplied entirely from a pump well, it became troublesome to keep it up. About three years ago an ingenious tradesman proposed that I should make trial of burnt limestone, slacked with sea water from the Firth of Forth here, and with plaster prepared with sea water also. I laid it on about an inch thick above the flag-stones, and of late years the pond has retained the water much better. It is well to lay on the lime plaster in dry weather, and allow it to remain as long as possible to firm and somewhat dry; the hot lime and salt harden the plaster considerably, and when the pond is filled the fresh water does not soften it greatly, and hence I now find a little pumping now and then keeps up the pond to the height required. *Thomas Millie, St. Clairtown, Kirkaldy.*—I have no doubt that the ineffectual pudding complained of by "J. J." has arisen solely from the use of a porous clay, and not from the circumstance of the subsoil being gravel. I made a large tank here by puddling several years ago, and it has never leaked a drop, but although we have seven feet deep of good brick clay, I knew from experience that it was unfit for puddling. I therefore carted some very strong clay from Notting Hill, about two miles hence, which I had well beaten up with water, and then beaten in to the thickness of 15 inches, and I am convinced that it will hold water as long as it remains undisturbed. I may add that the bottom of the tank rests on sand and gravel. *C. L., Hammersmith.*—"J. J.'s" observation that, in the attempts to make his pool watertight, the clay was "well beaten," seems to indicate that it was not really puddled. Puddling, as the term implies, is making a puddle of earth or clay with water. It enables the smaller particles to insinuate themselves and settle under water among the larger ones, so as to form a compact watertight mass. Lining a pond or pool with clay, without the intervention of more water than is just enough to render it sufficiently plastic that it may be beaten, is not puddling. In 180[illegible] a dock at Chatham had been condemned on account of leakage, but by excavating at the back of the existing walls, and filling up the space with earth thrown into water, the late Sir S. Bentham rendered it effectually watertight. In 1811 the saving resulting from this mode of repairing the dock amounted already to 40,000[illegible] As the subsoil of "J. J.'s" pool is gravel, probably of a coarse description, it would be advisable to mix straw or leaves with the puddle, so as to fill up temporarily large vacuities; this has been successfully practised in the construction of the "Canal du Midi" in France, and in other works. As regards the embankment at the lower part of it, a slight or temporary wall of turf or of the larger stones found among the gravel might be formed on the clay bottom, and a puddle made behind it. As neither pure sand nor pure chalk are impervious to water, soils containing a large quantity of them are not

suitable for puddling, and the thickness of the puddle must depend upon the proportion of clay used for it. *M. S. B.*

Gardeners' Royal Benevolent Institution.—Like your correspondent of last week, I have always felt that those who have the first claim on the voters of this charity are persons who have assisted others; for such I have always voted until this election, and I think that every one must feel that the 11th applicant, being totally blind, had certainly a prior claim: for, with him, hope long deferred must have been sadly felt. This was the motive that induced me to vote for one who had not subscribed to the charity. The number of votes he got at the previous election (viz., 348) showed that his claim was acknowledged. I think also that the 9th applicant was a very fair election, as he had subscribed four years, and had been trying nine (times?) years to get the annuity—a long time to wait when in want. So far, I must say, little fault is to be found; for place ourselves in the situations of the applicants in question, and we would soon find what a wearisome thing disappointment is at their time of life—year after year having their hopes raised and then depressed. I am really glad that they are elected. We now come from the 11th and 9th to the 5th application, and here I fear that the complaint of your correspondent has some grounds; for on looking to my polling-paper for the prior election, I find that the 5th application only numbers 51 and 46 votes, and that a second application of one who had never subscribed to the charity numbers 158 votes. Now, this does not look well; for if we go back to the 4th application we find George Kidd, who has subscribed nine years, only five votes ahead. From this it would appear that what your correspondent complains of is but too true. Had Ann Arnold, whose husband had subscribed eight years, numbered these votes, instead of Thomas Blair, it would have looked better and done more credit to the justice of voters. I do not think that the claim of having subscribed to the charity is sufficiently acknowledged, neither do I consider it fair that there should be any soliciting votes except from the parties themselves. Some lady very kindly interested herself for John Kent, but with what success I am uninformed; with me the prior claim of others made it imperative to refuse even a lady. I often find it difficult to please myself in voting. This time and for the first time I voted, as I have already stated, for one who had not subscribed to the charity, because I really looked upon J. Appleby, being totally blind, and first on the list after 11 applications, to be a very proper object of charity. My next vote was for J. Blacke, whose years (80) induced me to give him support, which however he cannot, in the course of nature, long enjoy. My other vote was for Geo. Kidd, a subscriber of nine years, and I am certainly at a loss to know upon what ground he could have failed, except upon the one of which your correspondent complains, and which I fear is exercising an injurious influence on voters. Now these things are not right, and I am surprised that a class of men (who are mostly considered thinking men) should allow them to exist. I think it ought to be a rule with all subscribers to the charity, first to help those who have endeavoured to assist others, and when all their claims are satisfied others should take priority according to age, afflictions, or number of applications. Let us hope that henceforth all matters connected with so excellent a charity as that under notice may be carried out with fairness to all concerned. *G. Bond Walcot, Gardener, Salop.*

Nectar-secreting Organs of Plants.—In the account compiled by Gärtner ("Beiträge zur Kenntniss der Befruchtung," p. 75, 1844) of the various organs in plants from which nectar is secreted, no mention is made of the stipulæ of the leaves of the common Vetch and Bean. On two occasions I have observed hive bees by the thousands industriously visiting the little dark (but sometimes colourless) glands on the under side of the stipulæ of the Vetch. On a hot day, on each gland a minute drop of nectar may be seen almost with the naked eye, and which is sometimes so large as to be just perceptibly sweet. I have seen the hive and another species of bee, a moth, ants, and two kinds of flies, sucking these drops. The hive bee never once even looked at the flowers, but attended solely to the stipulæ; whereas, at the very same time, two kinds of humble bee were sucking the flowers, and never visited the stipulæ. I noticed the hive bees on three successive hot days thus employed; but on the overcast morning of the 12th, after the previous very rainy day, not one was to be seen at mid-day, but numbers of humble bees were sucking the flowers: at 4 o'clock P.M., however, after some hot sunshine, a little glittering drop of nectar studded every gland, and the hive bees, by their mysterious means, had found it out, and were swarming all over the field. The fact of nectar being secreted by an organ quite distinct from the flower (though known in other cases) seems to me of some little interest, as showing that those botanists cannot be correct who believe that nectar is a special secretion for the purpose of tempting insects to visit flowers, and thus aid in their fertilisation. No one probably who has attended to this subject will dispute that insects in very many cases do thus aid the act of fertilisation; but we must, I think, look at the nectar as an excretion which is only incidentally (as is so often done by nature) made use of for a further but most important object. *C. Darwin, Down, Farnborough, Kent.*

Sir Harry Strawberry.—The following is an extract from a letter which I have received from a gentleman residing in France, relative to this Strawberry:—"Aux Sablons near Morêt-sur-Loing. Seine Marne, *July 4th*, 1855.—I have much satisfaction in announcing the result of my crop of Sir Harry. I must confess that I have never eaten anything so delicious, and I assure you that you did not speak too highly of the qualities of this beautiful fruit, which in reality is far superior to any other known, and consequently cannot fail to find its way into the garden of every true amateur. The plants which I kept under glass proved that Sir Harry is equally well adapted for forcing: it even seemed to me that its fruit had a better flavour than those grown afterwards in the open air. Several of my friends having seen the Sir Harry, and the lithograph of the same, desire to possess it. *Frederick Gloede.*"—*Richard Underhill, Sir Harry's Road, Edgbaston, Birmingham.* [Remember that this is said of a Strawberry grown in a southern and better climate.]

Hailstones.—The following are tracings of hailstones made a few minutes after they had fallen, but not until the storm had passed, and therefore not until they had begun to dissolve. They represent the true sizes of the stones at the moment of tracing them, and something of their extraordinary shapes, to which, however, no representation can do justice. The majority of the large stones were most grotesque in form; all were very hard and very cold, a few sufficing to make the hand ache immediately they were collected therein. Some of the

larger stones were round and white in colour, but the greater number were clear as crystal. The storm came on very suddenly, about six A.M. last Saturday, after continued thunder in the early part of the morning, and some rain. It passed here from over the adjoining hills, almost direct south to north, and did not, I think, extend above two miles laterally. The stones represented were picked up in a space about a dozen yards square, in a temporary yard and shelter in the park for cows, where I had taken refuge. With the large stones descended ordinary hail and rain, but pieces like those figured formed the remarkable feature of the storm. Need I add that glass and vegetation within their reach suffered severely? *J. Taylor, Aston Clinton, Bucks, July* 16.

Societies.

ENTOMOLOGICAL, *July* 2.—J. Curtis, Esq., F.L.S., President, in the chair. Amongst the donations to the library and collection, announced as having been received since the last meeting, was a collection of 94 British species of spiders (in addition to 60 species previously presented), and 13 species of harvest spiders, presented by R. H. Meade, Esq., preserved in a saline solution of sulphate of magnesia; also a monograph on the Phalangiidæ by the same gentleman, and M. de Saussure's supplement to his monograph of the family Vespidæ. Mr. Foxcroft sent a number of rare insects recently captured in Perthshire, with notes of the habits of a caterpillar found in ants' nests, apparently belonging to a species of Tinea. Mr. Westwood exhibited specimens of the young larvæ of Meloe which had been found hanging in clusters on Potato plants. Mr. S. Stevens exhibited a new and very remarkable Longicorn beetle recently brought from the Feejee islands by Mr. Macgillivray, forming the type of a new genus. Mr. F. Smith exhibited specimens of the rare ant Tapinoma erratica, several colonies of which had been found near London by Mr. F. Grant. Mr. Arthur Adams exhibited specimens of Drypta emarginata taken near Portsmouth; and Mr. Staunton a collection of drawings of the transformations of minute Lepidoptera from the collection of a Prussian amateur, including several very remarkable species. Mr. Hunter exhibited a specimen of Straurops Fagi recently captured, and a number of young larvæ hatched from its eggs; and Mr. Jansen presented the rare Hypulus quercinus, captured near Colney Hatch, to the Society's collection. Mr. Curtis mentioned the circumstances connected with the capture of the blind beetles Anommatus and Langelandia at Paris, and also stated that Dr. Asa Fitch had recently informed him that the Hessian fly was at the present time committing fearful damage to the Wheat crops in North America, which he attributed chiefly to the failure of their natural enemies and parasites, and inquiring into the practicability of importing some of these useful species of insects. Mr. Westwood suggested that a far more practical plan would be the adoption of Professor Henslow's Wheat-midge sieves. A letter was read from Mr. Bates relative to the bird-feeding habits of a species of Mygale which he had observed in Brazil in crevices on the trunks of trees, thus confirming Madame Merian's statement, which had been disputed by Mr. MacLeay. Mr. Meads stated that from the observations of Mr. Blackwall the spider was not provided with a poisonous secretion. Mr. Edwin Shepherd, however, affirmed that toads had repeatedly been killed by large red spiders when shut up together. Mr. Newman read a description of the transformations of that common pest to horticulturists, the Otiorhynchus sulcatus, which he had observed to be very destructive in Ferneries. Captain Cox called the attention of the Society to the injury committed on the Lime trees in Hyde Park by the pretty little moth Tinea Linnæella, and also on the Oak trees by Trochilium Cynipiformis, and suggested the advisability of the Society applying to the Commissioners of Woods and Forests on the subject. The president, however, considered there was little good to be apprehended from such a step at a time when Mr. Kennedy's dismissal from office had so recently taken place.

Notices of Books.

Maxims and Hints on Angling, Chess, Shooting, &c. (Murray's Railway Reading), is a reprint of Mr. Richard Penn's maxims on those subjects. As a veteran sportsman his *dicta* are never to be neglected; on this occasion their force is much increased by capital woodcuts from the pencil of Chantrey, Lee, and others. The following examples of Mr. Penn's sayings show that this is *the* railway book for sportsmen.

"Although you may be a very agreeable gentleman, generally speaking, you will have chosen an unlucky moment for making yourself particularly so, if on some fine morning after breakfast you should volunteer to accompany two of your friends who are preparing to leave the house for a day's partridge shooting without any expectation of being joined by a third person.

"When you are obliged to walk on the left-hand side of a man who carries the muzzle of his gun too low, do not be so very polite as to take no notice of this dangerous habit. He may, perhaps, appear quite offended at your venturing to question your perfect safety. But be that as it may, to be constantly stared at by the eyes of a double-barrelled gun is so awfully unpleasant, that your friend's looking rather cross is a matter of less consequence.

"When you are making your way through a thick wood with too large a party, it is better that you should be scolded by some of your friends for troubling them with very frequent notice of your individual locality, than that you should be shot by any of them from want of such notice.

"On the day of a great battue, if one of the party (not you) should shoot much better than the others, and this should by chance be talked of after dinner (as such matters sometimes are), do not say much about the very large number of hares and pheasants killed by you—on some other occasion.

"Never ask beforehand whether or not you are to shoot hares in the cover into which you are going, but never shoot one after you have been told not to do so.

"Many persons who are possessed of much information have a tedious and unconnected way of imparting it. Such men are like dictionaries, very instructive when opened in the right place, but rather fatiguing to read throughout.

"The foundation of good breeding is the absence of selfishness. By acting always on this principle — by using forbearance and moderation in argument, even when you feel sure that you are right, and by showing a becoming diffidence when you are in doubt, you will avoid many of the errors which men are apt to fall into. Reader, bear in mind that this holds good in all things, and not only in Fishing, Shooting, and Chess."

The Rev. Thos. Milner has produced a volume called *The Crimea, its ancient and modern history, &c.* (Longmans, small 8vo), which will be acceptable to the many who are unacquainted with the writings of continental authors. It gives an account of the original inhabitants of the Crimea, of its subsequent history, and of the events which brought it under Russian rule. The author, who appears to have been diligent in consulting

authorities, has thus produced an agreeable volume, of which, however, the Natural History forms so slight a portion that the narrative of Koch remains as indispensable as ever to the student of this now celebrated peninsula. We could have wished that Mr. Milner had stated from what sources his information is compiled. One curious thing pointed out by him is the ignorance of the Russians themselves of the country so lately as 1764, when General Manstein's Memoirs of Russia made their appearance. The rude map which accompanied that work is here republished, and shows that even the existence of Sebastopol was unknown to the Russian engineers who accompanied Marshalls Munich and Lacy in their invasions. Even de Tott would seem to have thought Balaklava and Sebastopol to be the same; at least it is evident that he was describing Sebastopol when he spoke of the *extent* of the harbour of Balaklava. A similar mistake was made by an old correspondent of the "Gentleman's Magazine," who described Aktiar, the present Sebastopol, as having a commodious *but not very large* haven, while to Balaklava he assigns "a fine harbour containing ample room for a very good fleet." If the present war has done nothing else it has, at any rate, improved our ideas of Crimean geography.

Captain Chiosso, in what he terms *The Gymnastic Polymachinon* (Walton & Maberly), by means of descriptive and clever woodcuts gives an account of the means employed by him to render gymnastic exercises conducive to health. This gentleman is undoubtedly the most rational gymnast in London; he applies the system of exciting muscular action with excellent sense, and the results which flow from it are, in his hands, eminently advantageous. In general the world imagines that gymnastic exercises consist of mere feats of strength, suitable to an athlete, but dangerous to others, and they shrink from exposing themselves or their children to the risks of such a discipline. Nothing can be further from the truth. Captain Chiosso is as much opposed as any man to violent exertion, the danger of which he fully recognises. On the contrary, he endeavours gradually, by gentle means, to solicit the muscles to act, and he trusts to skill and time to produce force where there is constitutional weakness. We speak from full knowledge of him when we say that in such hands as his gymnastic training is at least as important as mental exercise, and that all young persons should be familiarised with it. In all education the first point is to bring out the physical powers, without which mental powers are feeble, of little value, and soon give way under continuous exertion. The gallant author, who is an old Italian officer, fully states in this book what the numerous maladies are which his experience tells him are alleviated by the Polymachinon.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Now that many of the hard-wooded plants will be removed to the out-doors plant ground, painting and other necessary repairs should be done, as the houses can be more conveniently emptied or thrown open than at any other period of the year. And if painting is to stand it must be done when the wood is thoroughly dry, and the present season is the most favourable for securing this; but except where painting is done sufficiently often to keep the wood covered, some care will be necessary, even at this season, in order to get the wood perfectly dry, and unless this is secured the paint will be sure to blister before the end of next summer, however good the materials and workmanship may be. Therefore make sure of having the wood perfectly dry before commencing painting, whatever inconvenience this may involve.

FLOWER GARDEN AND SHRUBBERIES.

Where Roses are extensively grown (which they should be about every place in proportion to its size), they form the principal attraction of the out-door department of the garden at present, and should be frequently looked over, removing decayed flowers, &c., which if allowed to hang on the plant have a very unsightly appearance, and tend to encourage mildew, &c. Roses, if grown in masses or beds, should be arranged so as to contrast the colours in the most effective manner; and where this has not hitherto been attended to, the effect of the present arrangement should be carefully looked to while the plants are in full beauty, noting any alterations that may be deemed necessary, which will greatly facilitate the execution of the same at the proper season. See that the plants are not allowed to suffer through want of moisture at the root; and where the soil is of a light sandy nature, the plants should be liberally supplied with manure water, giving a good soaking two or three times a week if possible; but if the soil is strong and rich, manure water may be dispensed with, as the plants will grow freely enough if kept moist at the root. Proceed with the propagation of favourite sorts either by budding or cuttings. We prefer the Hybrid Perpetuals, Teas, Chinas, and Bourbons on their own roots, and firm short-jointed cuttings of these root freely enough at the present season if properly managed, but Rose cuttings taken from plants grown in the open air should not be put into heat. They will, however, root freely enough under a hand-glass on a mild bottom heat, or even in a shady situation in the open border, but they are very liable to "damp off" in a moist warm situation. The readiest way of propagating these, however, is by cuttings taken from plants grown under glass for flowering in spring, which root almost as freely as cuttings of Verbenas. The propagation of the ordinary bedding-out plants will soon require a large share of attention, therefore see that the most is made of the present leisure and convenience for getting up a good stock of the more valued kinds of hardy things, and do not forget a good stock of Pinks, Picotees, &c. See that the bedded-out stock is kept moist at the root until the beds are fairly covered, which will soon be the case if the plants are well attended to and the weather continues such as it has been lately.

FORCING DEPARTMENT.

PINERIES.—Plants wished to show fruit at once, if backward in doing so, should, provided the growth has been well matured and checked, having been kept dry at the root for a time, have a good soaking of water, and be kept warm and moist. This treatment will induce an active root action, and if the plants have been properly treated, they will seldom fail of showing fruit at once, but everything depends upon the growth being well matured and checked. Avoid syringing plants overhead that are in bloom, save on the mornings of bright days, and then but lightly, for syringing in the afternoon while the plants are in bloom is the principal cause of deformed fruit. Young stock will be growing very vigorously, and every care should be used to secure robust stocky plants; see that the plants are afforded sufficient room for the development of their foliage, and do not keep the atmosphere so warm and moist as to induce weakly growth; attend to repotting, as this may be required by any of the stock, and see that all are well supplied with water at the root, whether in pots or planted out in the open bed, as any neglect in watering at the present season will probably result in the plants fruiting prematurely. VINERIES.—Give every attention to preserving the foliage in houses where the fruit has been cut, until the wood is thoroughly ripened. If red spider is at all troublesome, give the Vines a good washing with the engine, but do not injure the foliage by dashing the water against it too powerfully. Give abundance of air, keeping the house as cool as can conveniently be done in bright weather. Maintain a moist atmosphere where the fruit is swelling, sprinkling the passages, borders, &c., frequently. Look sharply after insects here, particularly where plants are grown under the Vines, and if black thrips or red spider is detected wash the infected leaves carefully, and look over them occasionally afterwards until the pest is fairly got out. See that the borders are not allowed to become too dry, and give strong manure water to plants bearing a heavy crop. Vines in pots intended for very early forcing next season should be in a forward state by this time, in order to permit of getting the wood well ripened, and allow them a period of rest. PEACHES.—Attend to last week's directions, using every means to keep clear of insects.

HARDY FRUIT AND KITCHEN GARDEN.

Proceed as expeditiously as possible with the laying in of the young wood of wall-trees, taking care that every superfluous shoot is removed first, for it is worse than a waste of labour to nail in wood that will only serve to crowd the trees and injure that which will be left at pruning time. Also attend to regulating the growth of pyramidal and other trained trees, looking over them frequently and doing what little stopping, &c., may be required. Do not allow trees that have been lately disturbed at the root to suffer for want of water, and where the soil is shallow and of a light dry nature an occasional watering or mulching will be useful to any trees that incline to grow too weakly, but do not water or mulch where there is any tendency to over luxuriant growth. Prepare the ground for fresh plantations of Strawberries, by manuring heavily and trenching some two feet deep, and get these planted at once, keeping them well supplied with water until they get established. Tomatoes must be well attended to, keeping the shoots thin and stopping above a cluster of fruit, for if the plants are allowed to grow too freely, there will be but a poor chance of a good crop, save in very favourable localities. Attend carefully to Celery and other growing crops, with water, giving a liberal supply to Lettuce and Cauliflower and recently planted green stuff. Take advantage of showery days to plant out a farther supply of winter greens, Broccoli, &c., and if a sufficient quantity of Celery is not already planted, this should be attended to at once, and must be well cared for after planting, with water, &c., otherwise good-sized heads need hardly be expected. If not already done, sow Cabbage for early spring use, and attend to keeping up a succession of Lettuce, Endive, &c.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 19, 1855, as observed at the Horticultural Gardens.

July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth 1 foot deep.	Temperature. Of the Earth 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 26th, 1844—therm. 92 deg.; and the lowest on the 23d, 1843, and 24th, 1838—therm. 40 deg.

Notices to Correspondents.

DISEASES: *A, Surrey.* The sheaths of the stems are attacked by Erysiphe communis, and the leaves by Uredo Rubigo vera (the common Red Rust). These common parasites seldom do material injury to the Wheat. The former is extremely prevalent this year in the south and east of England.—*J M.* We have seen many Apricot trees attacked exactly in the same way, and in some cases there has been an abundant flow of gum from the leaves. Such affections arise from atmospheric conditions over which we have no control, and your trees will probably be free from anything of the kind next year. You state that your tree has a large crop of fruit; on the trees which we have examined there was scarcely any crop at all, so that the affection cannot be due to the covetousness of the gardener.—*R A.* Your Grapes are attacked exactly in the same way as many which were forwarded to us last year, and of which we had ourselves an opportunity of examining. In every case alike we believe that the evil has arisen from the condition of the roots. If they are not healthy, the produce is sure to suffer. There is no external parasite. *M. J. B.*

GREENHOUSES: *Reading.* It is not practicable to describe what you ask for; except that the house should be made of wood and heated by a flue. Prices vary greatly. Your best way will be to apply for tenders from the hothouse building firms who weekly advertise in our columns.

INSECTS: *M T B.* The flies produced are the perfect state of the larvæ which fed on the ripe inflorescence of the common Lettuce. They are the Musca (Anthomyia) lactucæ. See *Gard. Chron.*, 1841, p. 364, for figure and description.—*R C.* The beetles you have sent as injurious to your Strawberry "Sir Harry" are, 1, Steropus madidus; 2, Omaseus melanarius; 3, Agonum parum punctatum; 4, Peryphus littoralis, all ground beetles, Carabidæ, which, from what is known of their habits, feed upon other insects and worms; you have therefore been destroying your friends instead of enemies, which are most likely either woodlice, ants, or small weevils.—*R J. (St. Ives).* Your Rose leaves are infested with the caterpillars of the pretty little moth Tinea ruficapitella, whose history and figures are given in *Gard. Chron.*, 1852, p. 292. This insect is quite unconnected with the scales of the Oleander, &c. As the moths are very minute and difficult to catch, the only remedy is to collect and destroy leaves which exhibit the lines formed by the mining caterpillars. *W.*

MAY'S MAGNUM BONUM LETTUCE: *S—y.* This has been proved in the Horticultural Society's Garden to be nothing more than the blackseeded Alphange Cos, seeds of which are annually given to the Fellows by the Society. It is one of those excellent varieties for the introduction of which kitchen gardeners are so much obliged to the Society.

MINT: *N B.* It is a very curious condition of the plant. A wood engraving is in preparation, and with it, when ready, we will publish our own views of the cause.

NAMES OF PLANTS: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*A Kentish Man.* 1, Cystopteris tenuis; 2, Lastræa marginalis; both natives of N. America.—*S T K* 1, Pleopeltis squamosa; 2, Cerastium tomentosum.—*S H A* young plant of Polystichum aculeatum of no interest. *S.*—*A F* Apparently Stachys germanica.—*Inquirer.* Beta maritima.—*East.* Not Anacharis but Callitriche, which will do no harm in the water.—*P W J.* Not an Acacia, but a Gleditschia; apparently G. triacanthos.—*I T A.* 1, Hibbertia volubilis; 2, Drosdrosace villosa.—*Cato.* Asplenium Filix-fœmina, made delicate by growing in the stove; and Streptocarpus Rexi. *S.*—*Sub.* 1, Lastræa, specimen not perfect; 2, Pteris serrulata, not hardy; 3, Asplenium Trichomanes, hardy; 4, Lastræa Filix-mas, young state; 5, Lastræa Filix-mas, perfect state; 6, Polypodium vulgare; 7, Lastræa dilatata. *S.*—*D P D.* Your Jamaica tree is Berberis vulgaris.—*R Rilott.* Scrophularia aquatica.—*J W.* Stanhopea tigrina.—*B L L.* Phytolacca icosandra.

PEAS: *W Denyer.* Your new early green Marrowfat Pea appears to be different, in some respects, from all green Marrows; but like all that class of Peas it is inferior in flavour to the white kinds, and more particularly to Knight's or the wrinkled black of Marrow Peas. It is not distinguishable in the size and appearance of the green pods from a kind called "Prize-taker," but it is very different in the dry Peas (if the sample furnished is a fair one), the Peas sent being double the size of those of the Prize-taker. It is however, as has been stated, inferior in flavour to many other kinds, and not to be compared in that respect with Knight's Tall White Marrow and the Victoria. Nevertheless it is a very good Pea, but nothing extraordinary; hardiness and exemption from mildew belong to the kind or season, not to the kind of Pea.¶

PAGE'S COMPOSITION: *W H.* This will not touch red spider or mealy bug. It kills aphides or green fly in the same way as soap-suds or gas-water; at least Mr. Gordon reports from the garden of the Horticultural Society that he can find no other advantage in it. You will not get rid of it without sulphur unless you can keep your Vines very frequently deluged with the syringe.

PHOTINIA: *Lillington.* You may cut back your Photinia now or next April. Stauntonia is a half hardy evergreen climber, not much known. We presume it may be had through some of the great nurserymen.

PITTOSPORUM TOBIRA: *A Subscriber, Bangalore.* In all probability your Indian climate is too hot and damp for it. Grow it in mere clay or heavy soil, and confine its roots by any artificial means, or prune them before its growth for the season commences.

RED SPIDER: *Ly J W.* This enemy is encouraged by allowing vineries to become too dry, or sometimes by the border being so. French Beans are its favourite food, and it multiplies among them very rapidly, if they are mismanaged, spreading from them to Vines. But this is always owing to bad management, and will not occur if a vinery is properly syringed. To throw the blame upon Strawberries is a mere assumption of practical knowledge. When the red spider does appear in a house seriously, recourse must be had to sulphur and white wash painted over the flues or pipes when they are hot, and continual syringing should be found sufficient. You will probably have to use first one remedy then the other.

MISC: *An Old Subscriber.* Your suggestion will be considered but there are difficulties in the way.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

PATENT WOOL MANURE, 8*l.* 8*s.* per ton.—Application for Agencies, from persons of influence and respectability, will be received until the 31st inst.
NOTTIDGE & Co., 81, Gracechurch Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8*l.* per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected; Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
Patron—His Royal Highness Prince ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.:—
Chemistry—J. A. C. VOELCKER, Ph.D., F.C.S.
Zoology, Geology, and Botany—JOHN BUCKMAN, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. BROWN, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. ARMSTRONG, C.E.
Manager of Farm—G. AUSTIN.

The Second Session of 1855 begins in August. The annual fees for boarders vary from 45 to 80 guineas, according to age and other circumstances. The fee for out-students is 40*l.* per annum. The College course of lectures and practical instruction is complete in one twelvemonth, although a longer course is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—CARLISLE, 1855.
PROGRAMME.

SATURDAY 21, MONDAY 23, and TUESDAY 24.—Trial-yard open at 9 o'clock in the forenoon, when the public will be admitted on each day at 5*s.* for each person, to view the Trials of the Steam Engines, Barn Works, and other Agricultural Machinery and Implements generally. This payment has special reference to the Trial-yard only, and will not entitle the person who makes it to an admission into the general Show-yard for the exhibition of Implements.

WEDNESDAY 25.—The Implement Yard open to the public from 7 in the morning till 6 in the evening; admission 2*s.* 6*d.* each person. The Judges to inspect the Live Stock and award the Prizes. At 1 o'clock (or as soon after as all the Judges shall have delivered in their awards), the public to be admitted into the Cattle-yard and to the Exhibition of Farm Poultry, on the payment of 10*s.* each person, at the Special Entrance; Members of Council and Governors of the Society being admitted by Tickets to be purchased at the Finance Department of the Society at the Show-yard. N.B. Notice will be posted up over such entrance when the Judges shall have completed their awards. At 8 o'clock in the evening the Yard will be closed.

THURSDAY 26.—The general Show-yard of Cattle, Horses, Sheep, Pigs, Farm Poultry and Implements open to the public from 6 in the morning till 6 in the evening; admission 2*s.* 6*d.* each person. The Dinner of the Society in the Pavilion adjoining the Show Yard at 4 o'clock, the doors open at 3.

FRIDAY 27.—The general Show-yard open to the public from 6 in the morning till 6 in the evening; admission 1*s.* each person. General Meeting of the Members in the Guildhall at 10 o'clock in the forenoon.

President—Mr. MILES, M.P.
Stewards of Departments.
CATTLE—Mr. Simpson, Mr. Woodward, Sir Stafford Henry Northcote, Bart., M.P.
IMPLEMENTS—Mr. Fisher Hobbs, Mr. Cavendish, Mr. Hoskyns.
POULTRY—The Hon. and Rev. Stephen Willoughby Lawley.
FINANCE—Sir Matthew White Ridley, Bart.; Colonel Challoner.
SALE OF TICKETS—Mr. Henry Wilson.
RECEIPTS AND ADMISSION TO SHOW-YARD—Mr. Raymond Barker.
PAVILION DINNER—Sir John V. B. Johnstone, Bart., M.P.; Sir John Villiers Shelley, Bart., M.P.; Mr. Brandreth, Mr. Thompson.
GENERAL ARRANGEMENT OF SHOW—Mr. Brandreth Gibbs.

By Order of the Council,
London, July 21. JAMES HUDSON, Secretary.

By the regulations of the Society, all persons admitted into the Show-yard, or other places in the temporary occupation of the Society during the meeting, shall be subject to the rules, orders, and regulations of the Council.

PAVILION DINNER TICKETS AND SUBSCRIPTIONS: at the Finance Department of the Show-yard. Pavilion Dinner Tickets, price 10*s.* each (including one-pint bottle of Wine), will be sold at the Finance Department of the Show-yard on the Wednesday and Thursday of the Show week, between the hours of 10 o'clock in the forenoon and three in the afternoon each day.

Subscriptions due to the Society will be received by the Finance Committee, at their department adjoining the public entrance to the Show-yard.

ROYAL AGRICULTURAL EXHIBITION AT CARLISLE.

RETURN TICKETS available for 14 days, are issued for Windermere at Euston and the other principal Stations on the London and North Western, Lancashire and Yorkshire, and Midland Railways, at a little more than one Fare. Visitors taking advantage of this opportunity of seeing the English Lakes will find that trains are specially arranged to leave Windermere, so as to reach Carlisle at an early hour on the days of Exhibition.

Just published, second thousand, now ready,

HARRIET MARTINEAU'S GUIDE TO THE ENGLISH LAKES. Beautifully Illustrated, demy 4to, extra cloth gilt, 7*s.* 6*d.*, fcap 8vo, 5*s.*

"It is the most complete Guide Book that has ever been published."—*Daily News.*

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.

N.B. Sold in casks containing 14 or 7 gallons, at 2*s.* per gallon. Casks (which cannot be returned), 5*s.* and 3*s.* each.

IMPROVED MOWING AND ROLLING MACHINE.

ALEXANDER SHANKS AND SON, Arbroath, Forfarshire, Inventors and Sole Manufacturers, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to this Improved Machine for Mowing and Rolling Lawns. The Machine is in operation in the Royal Gardens at Windsor Palace, Buckingham Palace, and at Osborne, in the Botanical Gardens at Kew, Regent's Park, Manchester, Sheffield, &c.: at Blenheim Palace, Trentham, Cleveden, Elvasten, Broadlands, Woburn Abbey, Clumber, Lilleshall, Castle Howard, Shrubland, Eridge Castle, Enville Hall, Tiptree Hall, Chatsworth, and in many other of the principal gardens in the kingdom as well as in the United States, British America, and on the Continent, where its merits have been fully proved, and its success established.

The machine is made to cut the breadth of 42, 30, 20, and 15 inches respectively, is exceedingly durable, easily managed, and adjusted to cut to the length required. The execution of the work is far superior to what may be attained by the most skilful mower, while at the same time a great saving of labour is effected, and the turf much improved. By the largest machine a Scotch acre may be mowed, rolled, and the Grass collected in one hour.

A. S. and SON have much pleasure in stating that they have made considerable improvements in their 15-inch or hand machine this year, by which the draught is considerably lessened. This machine combines all the merits and advantages of the larger machines with firm and secure construction, and is admirably adapted for borders and for lawns of no great extent.

ALEXANDER SHANKS and SON also respectfully solicit notice to "Fleming's Weeding or Salting Machine" for destroying weeds in gravel walks, court-yards, drives, &c. This machine is now in operation in many parts of England, where it has given ample satisfaction as the best and most economical means of thoroughly keeping down weeds or Moss.

Further particulars, with testimonials and prices, may be had on application.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

The Agricultural Gazette.

SATURDAY, JULY 21, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY,	July	25	Agricultural Society of England—Meeting at Carlisle.
THURSDAY,	—	26	
FRIDAY,	—	27	

THE annual meeting of the English Agricultural Society takes place at Carlisle next week, and a report of the proceedings will appear in our columns. The following is the programme. The trial of implements continues until July 24, the public being admitted on payment of 5*s.* to the yards where it is carried on. The implement-yard is open to the public on July 25 on payment of 2*s.* 6*d.* each person, and the judges inspect the live stock on that day. The cattle-yard is open on this day on payment of 10*s.*, so soon as the award of prizes has been completed. On July 26 the yards are open on payment of 2*s.* 6*d.*, and the dinner of the Society is held in the pavilion at 4 o'clock P.M. On Friday, 27th, the general show-yard is open for 1*s.* each person, and the general meeting of members takes place at 10 o'clock A.M.

THE subject of IRRIGATION is one of such great moment in some parts of England as to render it unnecessary to apologise for occupying a portion of our journal with notes upon the following points connected with it. We refer to:—

1st. The nature of soil and circumstances bes adapted for irrigation.
2d. The mechanical means necessary to its due accomplishment.
3d. The nature of the changes in vegetation effected by irrigation.
4th. The advantages to be derived from the practice where it can be properly carried out.

1st. A principal requisite in the formation of irrigated meadows is an unlimited supply of water, as it would appear that the quantity of this fluid has more influence than quality, as when water has percolated through one meadow it is not impaired for being conducted on to another. This is a consideration of some importance, as it does not appear that the efficacy of irrigation depends so much on the chemical constituents the water contains as might at first be thought: it seems rather to effect its good by a free percolation among and between the Grass roots.

If, therefore, water can be commanded in sufficient abundance for the process, the next point to ascertain is the capability of the land for favouring a steady even flow of water—not over the surface, as

this is mere flooding—but by slow yet unceasing filtering through every part of the crop, for if the water be stagnant the usual effect of want of drainage will be observed in the growth of "sour Grasses" and other weeds which mark wet land. A gravelly or sandy subsoil recommends itself as being best adapted for irrigation, and brooks or rivers usually flow in valleys of denudation, the worn-down rocks of which nearly always form a substratum of loose materials of greater or less thickness; in all such cases, therefore, the two most important adjuncts in irrigation, namely, water and a favourable soil are usually combined.

2d. When these are present the next subject for consideration will be the best method to be adopted in conducting the water over the different surfaces to be irrigated, in the due performance of which it is necessary to consider, not only how to conduct water to any part of the field, but how to cause it to *flow off again;* for without the latter part of the system be as perfect in its action as the former, a fatal stagnation will be the result, and hence it follows that any system which will secure these important ends with the least expense in the three following particulars will be the best to adopt; these particulars are:—

a. **The first outlay in the preparing the works.**
b. **The annual cost of repairs, and of necessary periodical attendance.**
c. **The amount of land taken up in the construction of the channels.**

Of course these are points which cannot be dwelt upon at length, as they must vary with the locality, position of the meadow, height to which the water has to be carried, and a variety of ever-changing circumstances, but the principles are in themselves simple, and require no less simple arrangements for securing their due development.

3d. The changes effected in the herbage of an irrigated meadow are a no less curious subject in relation to vegetable physiology than they are interesting in an agricultural point of view; these consist of the two following:—

a. Change of quality.
b. Increase of quantity.

A meadow observed upon the bank of the Churn, in the neighbourhood of Cirencester, which, from its slope could be only half covered with water, presented particulars which are tabulated below. It is necessary to remark that the meadow had a subsoil of oolitic gravel, and its pasture was that of a poor upland. The table will supply information on the following points:—

1st. The names of the natural Grasses.
2d. The proportions of these observed in the meadow before irrigation.
3d. The changes effected in two years of irrigation.
4th. Those on the fourth year.

Table I.*—*Representing the changes of Grasses under Irrigation.*

Botanical Name.	Common Name.	Proportionals. Before Irrigation.	After 2 yrs Irrigation.	After 4 yrs Irrigation.
Alopecurus pratensis ...	Meadow foxtail-grass ..	1	2	4
Poa pratensis	Field meadow-grass ...	2	3	4
„ trivialis	Roughish meadow-grass	1	2	1
Briza media	Quaking-grass	2	...	...
Cynosurus cristatus .	Dogstail-grass	2	1	...
Aira cæspitosa	Hassock-grass	1	...	...
Agrostis stolonifera ...	Marsh bent grass ...	1	2	3
Dactylis glomerata ..	Cocksfoot-grass ...	1	2	3
Avena flavescens ..	Yellow Oat-grass ..	2	3	3
„ pubescens ..	Soft Oat-grass	1	1	1
Hordeum pratense ..	Meadow Barley-grass ...	1	2	2
Lolium perenne ..	Perennial Rye-grass ...	2	4	6

This field has trebled in value in four years.

This table shows that all the good Grasses have increased in quantity, whilst the unfavourable kinds have decreased, and this may always be noted in pastures—they improve by increasing good herbage, which consequently smothers the bad; the opposite produces a reverse result.

Nor is it only with those plants of the natural order *Gramineæ* that changes occur: herbs of other families present the same facts, which may be gathered from:—

Table II.—*Representing the changes of Herbs formed with the Grasses.*

Botanical Names.	Common Names.	Proportionals. Before Irrigation.	After 2 yrs' Irrigation.	After 4 yrs' Irrigation.
Ranunculus acris ...	Upright meadow crowfoot	1	3	1
„ bulbosus	Bulbous crowfoot	3	1	...
Plantago lanceolata	Narrow-leaved Plantain ...	3	1	1
„ media ...	Broad-leaved Plantain ...	3	...	...
Trifolium repens ...	Dutch Clover	2	...	...
„ pratense ...	Broad Clover	1	2	2
Anthriscus vulgaris	Common beaked Parsley	1	2	1

Hence, then, irrigation exerts great influence on vegetation; not it would appear all at once, but by degrees, and that this change is for the better, may be gathered from the following:—

* This table and the succeeding one are taken from the Journal Royal Agricultural Society, Vol. xv., part ii.

Table III.—*Representing increase in Money value under Irrigation.*

1st year of Irrigation,			25*s.*	Rent the acre,
2d	do.	do.	35*s.*	do.
3d	do.	do.	50*s.*	do.
4th	do.	do.	60*s.*	do.
8th	do.	do.	100*s.*	do.

It is further worthy of remark, as respects the meadow observed upon, that although only a part of it could be irrigated, yet from the animals depasturing thereon having range over the *whole* meadow, the *unirrigated* portion has been also much improved, so that where all a meadow cannot be brought under the influence of this agent, it might be well to consider if only a portion can be so cultivated.

4th. This necessarily leads to a consideration of the advantages to be derived from the practice, for if a whole meadow be improved by the irrigation of a part, so may we not consider the utility of such meadows to the farm in general. This will become evident by a glance at the following facts:—

a. **Irrigation produces earlier pasture.**
b. **It always secures a good late herbage—lattermath.**
c. **Its yield of hay is much more certain where plenty of water can be commanded.**

Hence, then, this portion of our subject will need no comment; but if this be so in ordinary cases, how much more so in a district like the Cotteswolds, where the great breadth of the land is on uplands of the porous oolitic rock. Such meadows in the valleys assist sheep farming in an extraordinary manner, as they enable the farmer in a not very genial climate still to have pasture for his early lambs, and thus to compete with those under more favourable circumstances as to climate. It is on this account that irrigated meadows are so carefully managed in the neighbourhood of Cirencester, and we shall, therefore, devote another paper to a detailed account of their management.

SOME of the reports on DAIRY PRODUCE which have reached us are published below. Those interested in the subject will see whether Mr. SCOTT's or Mr. HORSFALL's statement is best borne out by them. The most valuable of the series is that by Mr. SCOTT himself, and quite corroborates his original account of the average annual produce of a cow. This, the completest record that exists upon the subject, makes 200 lbs. a year as the average yield of butter from a cow. It remains, therefore, for the compiler of it to maintain his opinion of Mr. HORSFALL's *ordinary* experience if he can.

DAIRY STATISTICS.

How much milk does it take to make 1 lb. of butter? To answer that question correctly it is obvious that a series of experiments would require to be gone into, and the results minutely ascertained. My experience being rather limited in regard to dairy management, I have never taken the trouble to ascertain the quantity minutely; but a Mr. Williams, of this neighbourhood, who has had the management of very extensive dairies for the last 20 years, has taken the trouble to make out the following calculations of the working of a dairy for 12 months, by which I think a pretty correct answer may be arrived at.

	Kind of Food.	Quantity of New Milk. Galls.	Quantity of New Milk. pts.	Cream taken off. Galls.	Cream taken off. pts.	Quantity of Butter. lbs.	Average of New Milk for 1 lb. of Butter. Galls.	Average of New Milk for 1 lb. of Butter. pts.	Average Cream for 1 lb. of Butter. Pints.
April, 4 weeks' average									
May, 4 weeks' do.	Grains, wash, hay, and Grass	323	2	36	7	125½	2	4½	2½
June, 5 weeks' do.	Grass	395	5	45	0	147	2	5½	2½
July, 4 weeks' do.	Do.	432	2	50	3¼	163½	2	5½	2½
Aug., 4 weeks' do.	Grains and Grass	454	2½	47	7	155½	2	7½	2½
Sept., 5 weeks' do.	Grass	360	2¾	37	6¾	114½	3	1	2½
26 weeks' do.	Do.	340	1	32	4	114½	3	0	2½
	Per Cow ...	384	3⅔	41	6	136⅔	2	6½	2½
Oct., 4 weeks' do.	Grass	270	7¼	30	2	99½	2	5¾	2½
Nov., 4 weeks' do.	Grass and wash	198	6	26	5	81½	2	3¼	2½
Dec., 3 weeks' do.	Grains, wash, hay, and Grass	138	3¼	18	5¼	60½	2	2½	2½
„ 3 weeks' do.	Do.	143	3	17	1½	59½	2	3½	2½
Jan., 4 weeks' do.	Do.	155	5	20	0	66½	2	2½	2½
Feb., 4 weeks' do.	Do.	239	6	29	5½	101½	2	2½	2½
March, 4 weeks' do.	Do.	216	1	27	3¼	89½	2	3½	2½
26 weeks' do.	Per Cow ...	198	7	24	6	81½	2	8½	2½

By the above table it will be seen that it takes 2 gallons 6½ pints of new milk to make 1 lb. of butter for the summer half-year, and 2 gallons 3½ pints for the winter half-year; or for the 12 months it takes 2 gallons 5 pints of new milk to make 1 lb. of butter, and 2½ pints of cream to make 1 lb. of butter. The stock from which the above experiments were taken were chiefly what are generally known as the well-bred Irish cow, and the produce from that animal, if well selected, is I think as good as any. No doubt crosses of the Dutch and Durham produce also good dairy cows; but, as far as I have seen, the Durham is much better adapted for the butcher than the dairy. The Ayrshire is also good for the dairy, with every tendency to fatten, and is perhaps better adapted for light soils than any of the other breeds. About 20 miles from this I knew a large dairy of pure Devons; they were a very pretty stock; they gave milk of a rich quality, but much smaller in quantity than any of the others.

To ascertain the comparative merits of the different breeds on the same pasture, and with the same treatment, would be very desirable, and perhaps some of your correspondents might be induced to try the experiment. *David Barclay, Blarney, Cork, July* 11.

The average produce of "butter" from a cow in the course of a year in this neighbourhood is about 13 dozen (lbs.). I can mention individual cases in which a dairy of cows have produced 19 dozen per cow, but this is a rare occurrence. One quart of cream makes a pound of butter; on one occasion I found that when 50 quarts [? gallons] of milk were measured out that they produced eighteen lbs. of butter. In addition to the butter, we must bear in mind that a great deal of Dorset (skim milk) cheese is made from our dairies. Many of our best dairies are kept on poor land; but if the cows are not "too thick" (*i. e.* if they have plenty of run), their yield is great and of the best quality. *Dorsetshire.*

Mr. Littledale writes from Liscard Hall as follows:—I had churned on Saturday from a lot of cows, about 3 months calved, and all of the large Yorkshire breed, fed on Italian Rye-Grass, 42 gallons of milk, produce, 19¼ lbs. butter; to-day, 52½ gallons of milk, produce, 23¾ lbs. butter. The produce of butter varies with the breed of cows; in a general way, we have found from the large Yorkshire cow it takes 3 gallons for a pound of butter; Ayrshire less; and an Alderney still less. At one time I took a great interest in trying experiments upon different cows, and the quantity of butter they would produce; and the most extraordinary yield, which I have never seen equalled since, was from a cow the cross of an Alderney and a short-horn, after having calved above 2 months; she gave so rich a milk, that in the lactometer the cream did not separate from the milk, and we had a pound of butter from rather less than a gallon of milk; and although a small, poor-looking thing, we had 14 lbs. of butter a week from her. We also had a large Yorkshire cow a great milker, and after having calved upwards of 3 months, she gave us 19½ lbs. of butter in the week; in the lactometer the average of cream for that description of cow was 8, this one's was 18. A cow gives much more butter when she has calved about 3 or 4 months, and the quantity of milk is diminished; also a great deal will depend upon the quality of the food. We churn by steam, and last summer we tried the shortest possible time we could do it in, it was a hot day, and we accomplished it in five minutes and a half, the engine making 300 revolutions per minute, and the quantity 80 gallons of milk; we have also found out in this very hot weather that it pays us well to put American ice into the milk, before churning, to reduce the temperature to get out more butter; the result of the same quantity of milk without ice, 15 pounds of butter; with ice, 20 lbs. *Cheshire, July* 9.

I am sorry I am not able to afford you any satisfactory account, having never been at all curious as to the quantity of milk necessary to produce a pound of butter, and indeed the difference in the nature of the pasture and the quality of the milk of different cows must render it almost impossible to ascertain the exact quantity required. If you can make any use of my last week's experience, I will just inform you that from 36 pails of milk (each pail 3 gallons), we made 32 lbs. of butter. Our cows were feeding in our best piece of pasture, so that I conclude we never make more butter from the same quantity of milk. *H., Suffolk.*

I have to tell you that on Friday, 10 quarts of milk were measured out from the morning's milking and 10 quarts in the evening; each lot was skimmed after standing 12 hours, and a second time after 12 hours longer. The 20 quarts of milk yielded 1 quart ¾ pint of cream, and that produced this morning 20 oz., or 1 lb. 13 oz. of butter. It was certainly not a good time to make an average trial, as the weather has been so very warm the past week, and the flies have been extremely troublesome to the cattle. A month ago we were making more than a fourth more of butter to the same quantity of milk. The cream was sometimes so thick we could not pour it from the jug, but had to take it out with a spoon. It has been very much thinner the last 8 or 10 days. Our cows, or rather cow and heifer (two years old) have lived wholly on Grass. *H. Gloucestershire.*

In answer to your question as to the number of quarts of milk required to produce 1 lb. of butter, I beg to state that I have had that quantity from 8 quarts, and have been assured that 6 quarts have sufficed in

some cases. Those, however, are exceptions. In these cases the cow must be about six months in calf; earlier the milk is more abundant, but less rich. I believe about 11 quarts to be a fair average. Our pound is the old Norman, and with the overweight with each pound prepared for market, I should think it is over 18 oz. English weight. The richest milking has been on a trial by me the mid-day and the evening next, contrary to accounts of dairy produce published in English works, which mention the morning milking as the richest. *B., Guernsey.*

Additional Returns obtained by Mr. Scott, and referred to in his Paper read before the Agricultural Society.

These dairy returns are given just as they came into my hands, none having been kept back. They represent the produce of upwards of 1000 Cows.

General Average	257	2588	11.10	13 78

The above returns of the produce of upwards of 1000 cows show a general average of 1.24 oz. of butter from one quart of whole milk.

THOS. SCOTT.

3, Charing Cross, July 11, 1855.

THE ROTHAMSTED GATHERING.

PRESENTATION OF A TESTIMONIAL TO J. B. LAWES, ESQ.

ON Thursday a large number of the most influential agriculturists of the county assembled at Harpenden, Hertfordshire, for the purpose of presenting a testimonial to J. B. Lawes, Esq., as a mark of their gratitude and esteem for the discoveries made by him in scientific agriculture.

The testimonial consisted of a handsome silver candelabrum, with six branches, ornamented with a running vine and hanging bunches of grapes. The inscription was as follows:—

"Presented to John Bennet Lawes, Esq., as an heir-loom, at the same time with a laboratory erected for him by public contribution on his estate, Rothamsted, Hertfordshire, in acknowledgment of the services he has rendered to the science and practice of agriculture, July 19, 1855."

The ceremony took place at Rothamsted, in a tent adjoining the new Laboratory, where about 200 persons sat down to an excellent dinner; at the termination of which the Right Hon. the Earl of Chichester, who presided on the occasion, after the usual loyal toasts had been suitably proposed and responded to, presented the testimonial. He said:—As chairman of that meeting it became his pleasing duty to present the testimonial, which then stood before him, as a mark of gratitude expressed by the agriculturists of this kingdom in return to Mr. Lawes for the service rendered to his country. It had been his lot to be one of the oldest and most zealous members of the Royal Agricultural Society, and he must say that he had on many occasions read with delight the valuable papers so ably and liberally contributed by Mr. Lawes. He had in some degree spoken as assuming to himself the position of the Royal Agricultural Society; but it was well known how much Mr. Lawes's labours had been appreciated, not by that Society alone, but by country gentlemen and farmers generally. He thought it an object worth a man's ambition to become a distinguished agriculturist, and to have one's labours appreciated; and further considered that husbandry should be made one of the elements of our education. The noble chairman then passed a high encomium on the character of Mr. Lawes, on his assiduity and attention to agricultural pursuits, and exhorted farmers to become reading as well as practical men. The noble chairman concluded by presenting the testimonial to Mr. Lawes, amidst much applause.

Mr. Lawes said he scarcely knew what he had done to merit so beautiful a building, accompanied by so magnificent a present as that which was now offered to him from the hands of a few of his private friends, and was quite unable to return them adequate thanks. The building in which he had hitherto prosecuted his experiments was certainly neither suitable for work nor fit for experiments; it was neither more nor less than an old barn, and yet although he was now possessed of so splendid a building, replete with every convenience, he still entertained a great respect for that barn. He then entered into a description of the commencement of his labours some 10 or 12 years since, showing the progress he had made from that period. He further contrasted the progress of agriculture in Germany with the little attention which had been paid to it in this country. He then drew the distinctive line between manufacture and agriculture, and said with manufacture they had iron, coal, and capital; but with agriculture, independent of the supply of guano and ammonia, they were limited in their operations by climate—the sun was their capital—thus necessarily showing the vast amount of skill required for beneficial production. He complained that farmers at the present time looked more to immediate return than to a lasting and more productive future—their first question on being shown any improvement was, "Does it pay?" He then reverted to his "infant" science, which he said some 12 years ago had all the helplessness of a baby, but with the appetite of a giant. It had, however, struggled on under the careful nursing and skilful management of his friend Dr. Gilbert, until it had obtained its present thriving condition. He, however, had been informed that it was reported in Germany that his baby was dead; but he thought the only corpse they would have to bury was that of the old barn, whose spirit was now transferred into this large and noble building (cheers). Mr. Lawes concluded by expressing a hope that that building would become their guiding star in the performance of their agricultural pursuits, and once more expressed his gratitude to those around.

The Rev. A. Huxtable then addressed the meeting, and said with reference to the old barn, he also entertained a great respect for it, and would wish that it should still be kept on. He then entered into a detailed description of his experimental crops and manuring, which we hope to give hereafter. He highly complimented Mr. Lawes for his practical knowledge, stating that he (Mr. Huxtable) was unable to approach him, although he had tried; but the fact was, he had begun at the wrong end, for his friend had taken up practice before theory, while he had taken theory previous to practice.

Dr. Gilbert alluded to his connection with Mr. Lawes for the last twelve years, and spoke on the rotation of crops and the feeding of animals. He thought that every intelligent farmer ought in his own locality to endeavour to act on Mr. Lawes's plan, and become to a certain extent an experimental agriculturist.

Sir J. M. Tylden referred to the unfortunate state of the weather during the morning, and believed that had it been otherwise their number would have been considerably augmented. He, however, felt much satisfaction at the glorious burst of sunshine which greeted them on their noble chairman taking his seat. He looked upon it as a favourable omen. The last speaker (Dr. Gilbert) had called upon the various farmers to interest themselves in this grand undertaking; now he was from Kent, and would do all in his power in that locality, and he hoped others would do the same.

The following toasts were drank with enthusiasm:—By Mr. Huxtable,—"The Science and Practice of Agriculture." By Sir J. M. Tylden,—"Mrs. Lawes and all the members of Mr. Lawes's family." By F. Woodward, Esq.,—"The Chairman, Treasurer, Secretary, and other members of the acting committee." T. W. Overman, Esq., then proposed "the health of the President."

The noble Chairman briefly replied, expressing his regret that he should be compelled to leave them at so early an hour, and withdrew amidst a general display of kindly feeling. The remainder of the evening was then spent in conviviality and song, professional singers having been especially engaged for the occasion.

Home Correspondence.

Chaffcutter.—We have received the following testimony to the merits of Messrs. Richmond and Chandler's chaffcutter:—I have for the last 20 years used various cutting machines, but not until lately have I tried the above, the result of which, with steam or horse-power, is wonderful, and, deem it my duty to the public to make this statement. Previously to using this machine, chopping was a great labour and trouble, but now I can cut very near a ton per hour. I do not keep any racks in my stables, so that every particle is cut and eat up clean, which is a great saving. *Benj. Walker, Mirfield, Yorkshire.*

Mangold and Pig Feeding.—I see that doubts and inquiries are afloat respecting the merits of Mangold Wurzel for breeding sows. I have had it given to sows and stock pigs where we kept from 20 to 30 sows, and never had but one case of their miscarriage during six years either from that or any other cause; and they were fed on that alone except while they were suckling their young, when they had a few boiled ones and bran mixed with them, given a little warm, three times a day, but they also had a supply of raw ones beside them, which they enjoyed all the time. But as my statement seems a little strong it may be as well to state that they had them all the year, as we manage to make the old meet the new. The effect might have been very different had they been given only at times, especially when the sows were with young. The breeds were some of all sorts, but mostly the spotted Berkshire and white Chinese. They all kept themselves in good condition with nothing else but water, when the weather was very dry and warm; but it is well to mention all the drawbacks, though they may have nothing to do with the feeding. Sometimes the young, after weaning, got apparently too fat, and we lost some of them; they were what we called "bloated," and at last were unable to move freely. But this, I think, was more the fault of the breed, as only the white were affected in this way. *G. S., July* 16.

Agricultural Statistics.—As the resistance to fill up returns on the part of so many farmers residing in the counties selected for trial, makes it evident that there will be considerable difficulty in obtaining satisfactory data on the voluntary system to give any results that can be depended on, it may be worth while to ask if a compulsory system is to be adopted whether annual returns will be worth the trouble and expense of all the items selected for inquiry, or whether in respect to such matters as "Flax, Hops, Osiers, bare-fallow, permanent pasture, irrigated meadows, woods and commons," a period of 10 years might not safely be allowed to elapse before every farmer in the kingdom was again troubled with such questions, and we will go further and say the same of live stock of all sorts, which do not, except on rare occasions, suffer sudden diminution or increase, and cannot be of more importance to the country than the number of people requiring them for food or labour. By thus reducing the dimensions of the papers to be filled up and simplifying the process to a statement of the production of corn and Potatoes, so that half a dozen columns might be presented instead of 40, the objections to such a system would probably disappear, or be evidently so absurd as to be no longer tenable, for after all the real and pressing necessity of an annual return is referrible mainly to the price of Wheat, by ascertaining how far our own production is available for the nation's food, and how much therefore we shall need to be procured elsewhere. This is the grand plea for agricultural statistics, and we can imagine no sufficient reason for any intelligent well-disposed man to withhold the desired answers to the questions of how many acres of each kind of corn and roots he may grow, or even of how many bushels of one kind and tons of another he may grow, as a public question of the highest import to the nation. The nation has a right to be furnished with this information annually, but as to the numerous and (to many persons) perplexing queries about wastes and gardens and Cabbages, and working oxen, why let them be included in the census, when every master of a family may expect a goodly pamphlet of most "questionable shape," which will require most scholarly endowments to reply to, and which demands almost a 10 years' study to write down clearly in good faith. *J. W., Peterborough.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

WEEKLY COUNCIL, *July* 18.—Mr. MILES, M.P., President, in the chair.

LECTURE ON THE USE OF FISH AS MANURE.

Professor Way, consulting chemist to the Society, commenced his lecture by referring to the importance of the subject. The employment of artificial manures, however much it might have extended, was yet in its infancy, and in the course of 10 years it was probable that 100 acres would be artificially manured for every acre that was so treated now; but this could only happen with the aid of fresh sources of supply of the raw material for the manufacture of such manures. There was the greatest difficulty in obtaining the material to supply the manure market. In the case of phosphate of lime the demand had so increased that the price had nearly doubled in the last two or three years. It was, however, fortunate that phosphate of lime, occurring very largely as a mineral deposit, had been searched for and found in several localities, and other supplies of it were opening up, which promised eventually to meet any demand. No less important than phosphate of lime, as an element of manure, was some form of nitrogen of which the value was so abundantly proved. Now it could not be doubted, as he hoped to show, that such a source of nitrogen, in the highest degree available for the wants of vegetation, existed in fish. This source of nitrogen was practically unlimited, and he could not think that the obstacles in the way of obtaining it in sufficient abundance and at a moderate price were by any means formidable. The importance of this subject, Mr. Way said he felt to be so great that ,although it had been ably discussed before, and he might not be able to add anything very new to what had been previously said, the present lecture would, he believed, be productive of good, if only in keeping the attention of the agricultural public alive to the question. Of the value of fish and fish refuse as manure there could be little dispute. For a very long period the refuse of the pilchard fisheries in Cornwall, and of the herring fishery in the eastern counties and in Scotland, had been employed as manure with the best effects. And in seasons when they were abundant some kind of fish were caught expressly for this purpose—as in the case of sprats in the counties of Essex, Kent, and Sussex—the dog fish in Dorsetshire, &c. The use of fish, however, in its natural state was necessarily confined to a comparatively short distance from the place where it was caught; so valued, however, was this manure that he had seen Hop and Wheat fields covered in the winter with sprats at a distance of 25 miles from the sea, and that before the days of railways and when the farmer had to send his teams to fetch them home. There was a fresh abundance of evidence of the value of fish as manure, and the question was to what that value was to be referred. Mr. Way then gave a statement of the composition of different fish, exhibiting a table of analyses lately made in his laboratory on the subject. He remarked in the first place that the quantity of water in fish was not nearly so great as was usually thought. It was a vulgar error to suppose that fish was less solid than flesh; on the contrary, whilst the flesh of the ox contained as much as 77 per cent. of water, different kinds of fish varied from 60 to 65 per cent., and some contained much less than this even. The quantity of nitrogenous matter in fish varied considerably; to this ingredient no doubt a great portion of the manuring property of the fish was due. We had experience of the value of dried blood, of woollen rags, of horses' hair, and other animal substances, all of which were powerful manures; and the nitrogenous parts of fish being of the same composition could not fail to have the same effect upon vegetation. The next ingredient in fish was the oil: the Society would remember that he published in the Journal, in the year 1848, analyses of experiments made in that and the preceding season, and that he had found in those fish as much as 18 or 19 per cent. of fatty matter, a result which was at that time, he believed, quite unlooked for. Mr. Sullivan had more recently found 13 per cent. of oil in herrings. They would see by the table of results that the oil in different fish varied very much; in one case, that of mackerel, it was remarkably large. In a mackerel examined this last week, he had found as much as 24½ per cent. of oil, or one-fourth part of its entire weight. In this fish the oil seemed to substitute part of the water found in other varieties, for it did not contain more than 44 per cent. of moisture, or two-thirds of that usually present. The quantity of nitrogen and of ash was also very large, both of them very considerably larger than in any other fish of which the comparison was known. If available in quantities, therefore, this fish would be very valuable for manure. Now, considering the large proportion of oil in fish, it became important to consider of what value it might be in manure. It had become the fashion of late years to give too exclusive a consideration to the importance of nitrogen in vegetation,—not that we could too much value this important element, but that we were in danger of neglecting those substances which took a less prominent but a no less necessary part in the economy of vegetation,—that carbonaceous matter in the soil was beneficial if not indispensable to profitable cultivation, did not seem to admit of a doubt, and if so there might be clearly a choice between carbonaceous substances according to their rate of decomposition, &c. Now, oils were very susceptible of oxidation with the production, of course, of carbonic acid. He might only mention in illustration the spontaneous combustion often occurring when oily rags used for machinery, &c., had been thrown into a heap, and by the absorption of oxygen and heat consequent upon it had in many cases caused great destruction of property. Then, again, the manufacture of "drying oils," as they were called, by boiling Linseed and other oils in contact with the air; the experiments of Saussure, who placed different oils under receivers of air, and found at the end of the experiments that all the oxygen had become carbonic acid at the expense of the oil, were also to the purpose. Now it was easy to see that oil distributed through a porous soil would, on account of the great surface exposed, suffer rapid oxidation, and give off a ready supply of carbonic acid, which at particular periods of their growth might be most important to some plants. Mr. Way quoted passages from the work of Dr. Home, printed in 1762, and the "Georgical Essays" of Dr. Hunter, a few years later, to show that a very high opinion of the value of oil as manure was held by early writers. He also referred to the experiments of Earl Spencer with oil—to the use of whale blubber, which, however, no doubt owed much of its value to the flesh. He showed also that many of the substances known as powerful manures and containing nitrogenous matter also contained oil. Thus woollen rags, Rape-cake, &c., might owe part of their efficacy to this cause. Rape-cake contained about 4 per cent. of nitrogen, whilst its oil varied from 12 to 15 per cent. Again: shoddy (or wool refuse) with perhaps in some cases, as he had found, not more than 2½ or 3 per cent. of nitrogen, furnished upon analysis between 25 and 30 per cent. of oil. This substance was known as a good manure. On the whole this subject of oil as manure was well worth looking into; not that oil would be likely to be used directly as a manure (its value for other purposes being opposed to such a use of it), but that we might be able to value more correctly substances in which it occurred, and could not profitably be extracted as suitable for manure. He would be glad to find that any members of the Society would be induced to make practical experiments on this subject. The other main ingredient of fish was the ash or mineral matter, which, although of less importance than the others (on account of the smallness of its proportion), was not to be overlooked. Mr. Way here referred to the analyses of different fish, showing that in the lobster, which he had recently examined, the quantity of phosphate of lime was much as 5 per cent. of the fish in its dried state, and about the same in the mackerel; this phosphate of lime could not be without its use. Mr. Way next directed attention to the various methods of preserving fish that had been proposed, including those of Mr. Petit, by sulphuric acid—of Mr. Elliott, by the use of alkali—of Mr. Bethell, by the employment of tar oils—and of M. de Molons, by treatment with high pressure steam. He also mentioned the plan which was adopted by a manufacturer of manure (Mr. Stevens), who had a contract for the refuse fish of Billingsgate market, of incorporating the fish in superphosphate of lime, the quantity of water in the fish serving to dilute the acid, and being dried up by the natural heat of the process. He remarked, however, that there would be no difficulty in preserving the fish if it could be obtained. It was not so much a question of this or that process, but of the supply of raw material. He could not help believing that this was not an insuperable difficulty if systematic measures were taken to effect the purpose. Was it affirmed that our system of taking fish was incapable of improvement? Were the nets and other appliances of the fishermen, which were the same in kind as we read of 1800 years ago, although possibly improved in detail, were they the last and supreme effort of ingenuity and invention? Was nothing to be accomplished in the way of extracting from the waters of the sea a greater supply of its teeming population? Surely it was open to improvement. But it seemed to him that the calculations and arguments on this question were not usually quite to the point. Everybody talked of "refuse" fish, that is to say, the offal of edible fish, and the fish accidentally caught which were unfit for the food market, and it was said by those who certainly well understood the subject, "a boat with so many men will take in the day such and such a quantity of fish, of which the uneatable fish will amount to so and so, and that quantity will not keep a factory in work or create a manufacture of any national importance." But he said that fishing for manure must be the primary and the capture of edible fish the secondary consideration if they desired to raise this into a great national question. And we had yet to learn what would be the result of a day's labour of a given number of men, when their attention was directed not as now, to the comparatively rare and valuable fish, but to those which hitherto they had despised and avoided. In his opinion, the statistics hitherto put forward were worth nothing, because they were not derived from this point of view. In the search after fish for the manufacture of manure the proverb that "All is fish that comes to the net" ought to be varied to "All is fish that the net can reach." Prof. Way concluded his lecture, as he had begun it, by urging the necessity of encouraging every attempt to obtain new sources of raw material for the manufacture of manure. Without this a term would be reached when the competition for manufactured manures with an insufficient supply would raise the price up to the extreme limits at which their use would be remunerative—for a time the deficiency would be met by adulteration and inferiority of the article, and this, together with the scramble to get manure, would soon wean farmers from their partiality to artificial manures; then, indeed, the progress of agriculture in this country, at all events in the use of artificial manures, would receive a serious check. He did not wish to draw a gloomy picture; but such a state of things must inevitably result, if the increasing demand for manures were not met with some new and abundant supply of the raw material.

On the motion of General Hall, seconded by Mr. Gadesden, the best thanks of the meeting were voted to Professor Way for the excellent lecture he had then delivered; the President expressing the pleasure it gave him to put and concur in that vote.

Dr. Calvert remarked on the curious circumstance of some animals, low in the scale of existence, giving out ammonia while alive. He thought the source of ammonia a most important inquiry. With regard to insufficient supplies of manuring matter, he believed the Dutch and Chinese, who for ages had known its value, found no difficulty in securing it for their crops, while in England and other countries it was allowed to run down the rivers, not only polluting the water, but destroying the fish. A singular effect of gas tar had occurred to him; when poured over and mixed up with a manure heap in his yard, it occasioned on decomposition a most agreeable and powerful odour of bitter-almond oil to be exhaled; but the manure itself so strongly impregnated the Potatoes, to which it was afterwards applied as manure, with a rank foul flavour, that they could not be eaten. No particular increase of crop, either, had resulted from the manuring in question.—Mr. Paine gave an interesting statement of a series of experiments he had made on four acres of his land in Surrey, for the purpose of ascertaining the best manure for his Hops. The manures tried were of mineral and organic substances, alone as well as mixed, and each plot consisted of one-eighth of an acre. This land offered great variety of soil, resting on the upper and lower chalk, the firestone and the gault. The result of his trials was that Rape-cake, singly and in combination, for four years in succession proved invariably the best carbonaceous manure for his crop and land. He had found Hops, Turnips, Cabbages, Mangolds, and generally all large-leaved and rapidly developed crops benefited by fish, whale-blubber, oil, and fatty matters; but that, on the contrary, his corn crops derived no benefit whatever from carbonaceous manures.—General Hall cited the case of Mr. Nash, of Newmarket, who had applied Rape-cake to his Wheat crops on chalk land with great advantage.—Mr. Truesdale Clarke referred to the Earl of Essex's employment of powdered charcoal in his experiments published in the Journal.—Dr. Calvert referred to his cultivation of the best-selected Grasses in Yorkshire, 12 miles from the Northallerton Station, and invited members proceeding to the Carlisle meeting to diverge to that extent from their route, for the purpose of inspecting what he believed to be a unique collection, the result of 20 years' uninterrupted care and attention. He had found less nutriment in Grasses grown on exposed situations than in those in the shade. He had found no season more favourable for his Grasses than the last. He had in preparation a report on this subject for presentation to the Society.

The Council adjourned to a special meeting at Carlisle on the 27th of July, and to their ordinary monthly meeting in London on the 1st of August.

Farmers' Clubs.

EAST SUFFOLK.—At the meeting last week of the East Suffolk Agricultural Society the following remarks were made by Lord Stradbroke on the subject of Agricultural Statistics:—"They were well aware that during the last two years attempts had been made in Scotland, and in some counties in England—and it was no small compliment to say that the county of Suffolk was one of those so selected—to endeavour to arrive at a fair result of what was the probable amount of corn grown as the actual food for the great body of the people in this constantly increasing manufacturing and commercial country. If it appeared, as he thought it must do, that correct returns on so important a subject would be of much advantage to all, it was, as he thought, equally clear that if there were one class more than another who would profit by such results it was the agriculturists themselves. They were aware that in the month of July the corn merchants had for many years been in the habit of sending round to every part of the country to ascertain the probable amount of growing crops, and that they had consequently in the month of September been able to take some little advantage of the farmers, by knowing more than the sellers could probably be acquainted with. The result had been that farmers had sometimes sold their corn too soon, when it would have been wise to retain it; while at other times they had been induced to retain their corn, when it would have been to their advantage to have parted with it. If they could only ascertain from year to year whether the crops were likely to be above or below the average, at least they would all be upon terms of equality, and be subject to less fluctuations than had been observed during the last seven years which, he thought, had exceeded the fluctuations of any other period throughout his experience. Now, in stating to them that the county of Suffolk was one of those selected, he was happy to say that in 13 unions out of 17 the public expectation was not disappointed; for they had sent from these unions very correct details considering the opportunities which had been presented for collecting them. If he referred to those four unions which either omitted to send in, or at all events furnished very imperfect returns, he should do so, not with any intention of casting any slur upon them, but in the earnest hope that, whenever again called upon, after the mature consideration which the whole subject had undergone, having had the advice and assistance of the leading gentlemen and agriculturists of their own district, the farmers would feel the great importance of the whole question, and vie with those unions in the eastern part of Suffolk—he particularly alluded to the Plomesgate, the Blything, and the Wangford—where an example had been set, which had not been exceeded in any other part of Scotland or England in the full and satisfactory returns which had been furnished. From even what had transpired already, he was enabled to draw some comparisons of the results arising from the mode in which the land had been cultivated in this and the neighbouring county of Norfolk. They were well aware that there were few, indeed, he did not believe there was any county in this country where the farming was better carried on than in the county of Norfolk; and if they remembered that the area of Norfolk, compared with the area of Suffolk, was as 16 to 11, it would be found that the quantity of land upon which Wheat and Barley were grown in the past year was nearly to a similar extent. But, with regard to other crops, there was a vast and serious discrepancy with which it would be well perhaps for this country to become fully acquainted. He found that in the past year in Norfolk there were grown 161,186 acres of Turnips; while in Suffolk, so far as it had been ascertained, the quantity grown was 62,664 acres. This was rather a remarkable difference, considering the great similarity of the soil of the two counties. Of Potatoes there were grown, in Norfolk, 1958 acres, while the number was only 808 for Suffolk. Of irrigated meadows in Norfolk the number of acres was 15,926, while in Suffolk the number was but 6390. And when the return of sheep and lambs was taken at nearly a similar period in Norfolk, it was found to amount to 841,601, while in Suffolk it was but 405,944. He would trouble them now with only one or two more figures. Of bare fallows, in the whole county of Norfolk, there were 10,202 acres; in Suffolk, the number amounted to 41,923. If, then, we took into consideration the difference of size of these counties, we should find the waste of land in bare fallow in Suffolk to be six times as great as in Norfolk. He was well aware there were many gentlemen present who had often considered in their own minds what course could best be adopted to cultivate a crop on land which was called long summerland fallows. It was a subject of much difficulty. A near relative of his own had, in 1853, taken possession of his property in East Sussex, where he might say, without exaggeration, the farming was by no means commensurate with what they saw in this district. Upon the farm he had drained two fields with tiles, on one of which he had grown a crop of Wheat which had yielded in 1854 10 coombs per acre, on land which had previously never grown more than six. On the other field he grew a crop of Swede Turnips, which produced above 17 tons per acre on land where a Turnip had never before been grown. This had been done at an expense of 5*l.* per acre; so they saw that, with the prices which he received last year, he paid himself in the first 12 months for this extra expenditure. He thought these results were encouraging, and that it would suggest whether something could not be done to improve the system of long fallows. The next point to which he would allude was as to the difference which appeared to exist on many of the large farms in Cambridgeshire, as compared with the farming in Suffolk. He found that in Cambridgeshire a new system had been

introduced. By many of the principal farmers there had been carried out a plan of steaming a large quantity of the food given to cattle and sheep during the winter months. He had taken some slight pains to ascertain the result, and he found all who had tried it spoke most highly in its praise in an economical point of view. He hoped, therefore, it was not too much to say that this system might be also carried out in Suffolk, because he believed it would be of much advantage, more particularly at a time when food is scarce and prices high. Yet when they talked of high prices, it was a relative subject. Though prices were high now to what they had been, he understood from a gentleman of good authority, who was at the present moment employing a vast number of people in making a trunk line of railway through Canada—he had no doubt they were aware to what gentleman he alluded—at this moment, the prices of flour and beef were higher in that colony considerably than in England.

Reviews.

An Essay on the best Mode of Cultivating Potatoes. By Mr. Bennett. Printed for the Wakefield Farmers' Club, by Charles Hicks, Market Place, Wakefield.

This is another of those essays which the Wakefield Farmers' Club receives from its members and afterwards publishes for general circulation. We extract the passage in which the details of Mr. Bennett's practice are given, though, beyond the room given to his plants, and the large quantity of a "nitro-phosphate" manure applied in addition to farm-yard dung, there is nothing very remarkable. As to the estimated cost of the crop, we can only say that the "seeding" for an acre of Potatoes has generally been this spring worth nearly three times as much as is here put down.

"After the Wheat has been harvested, I then plough or skim the land, not very deep, and clean off the weeds and Couch. I next proceed to plough it for the winter, as deep as possible—the deeper the better. At spring we plough it over again, and perhaps it might be necessary to plough it over again, and work it to a mould. I do not think that it requires to be too fine. After, we set out the ridges at about 30 inches apart, and manure the land with about 10 cart loads per acre of good manure, which has been laid out and hilled for a few weeks, previously using 4½ cwt. per acre of Mr. Simpson's nitro-phosphate, sown on the ridges. We then plant the seed at least 1 foot wide. I am of opinion that the seed should not be too small, and when large it should be only cut in two. When planted a yard apart, the seed should be the largest that can be procured, and the Potatoes should be set whole. The sort which I have principally grown is that which is called the Prince Regent's, and I should say that any time from the middle of March to the end of April is the best for planting. After the sets are put into the rows, I like them to be covered as quickly as possible, which we do with the plough. There is, however, one evil attending this mode of covering, for the horse, in walking, either treads upon or displaces many of the sets; but I do not well know how this difficulty is to be obviated. After 10 days or a fortnight we then plough and afterwards furrow on the top of the ridge, which is, after a short time, harrowed down. We then horse-hoe as deep as possible between the ridges, pulling whatever Couch or weeds there may be. When the plants are coming up, the horse-hoe is used to loosen the earth about them, and to kill the weeds. We then give them a slight earthing, and they are then left till they grow high enough for their final earthing, when the horse-hoe is again used, as deep as possible, the plough following the hoe immediately. The earth should be thrown as high as can be, so as not to leave any channel or gutter on the top of the ridges. By so working the land, we get it quite as clear, and in as good a state as any summer fallow can make it. I have mentioned particularly the different horse-hoeings and earthings, because I think that much of the success of the crop depends upon the deep and effectual working of the land. For my own part, I always use for this purpose a horse-hoe with drag teeth made to go in any depth. The extra expense between a bare fallow and crop of Potatoes will, I think, be about 4*l.* 13*s.* 6*d.* per acre, and I calculate as follows:—

Five-and-a-half Sacks of Seed	£2	4	0
Setting and Shaking Manure	0	3	0
Ridging and Covering	0	2	6
Horse and Hand-hoeing and Earthing ...	0	8	0
Four-and-a-half cwt. of Nitro-phosphate ...	1	16	0
	£4	13	6

"Of course the cost of putting on the fold manure would be the same as if it were a bare fallow. I alluded some time back to the way of planting at a yard apart. I think it a good plan, and I have this year planted a portion of mine in this manner. They have to be earthed up by hand across the ridges, the haulms being spread out, and the soil put on the top with the spade, till only a short portion of the ends are out. By this means the plant is kept dry at the top, the water running down the stems on the side of the hillock. The ground is also better worked with the spade than with the plough. The cost is about 1*l.* per acre extra. I tried the plan last year, and found a better yield, the tubers being larger, with but few small ones among them. When the tops are dead, and the tubers are fully ripe, which may be known by the skin being fast, they may be lifted either by the fork or with the plough. I prefer the latter mode, for I think the sorts are more liable to be injured by the fork stabbing them than by the plough, and it is also cheaper. We then put them into pits, and cover them over as soon as possible with straw and a thin coat of earth, in order to keep the sun, wind, and rain from them, for if they are left a short time uncovered, the wind and rain will soon spoil their colour. After a while they should be turned and picked over, and covered for the winter with a greater thickness of straw and earth. I would now ask, if by an additional outlay of, say 5*l.* per acre, a crop of this valuable root can be grown, is it not better than letting the land lie idle all the year! It may be said by many that a crop of Swede Turnips is quite as valuable. I grant that, only so far as to the quantity required for the use of the farm, but there is much in favour of the Potato as being less in bulk per acre than the Swede Turnip, where both are grown to be sold off the land. Besides, Potatoes being more directly food for the people, it is a question whether an acre of Swede Turnips, pulled and consumed on the farm, will bring as much into the farmer's pocket, in the shape of beef, as an acre of Potatoes sold off the farm would do."

We would suggest, as regards the publication of the discussion ensuing upon the reading of the paper, that an abridgment of some of the addresses might be made with advantage.

Calendar of Operations.

JULY.

CHESHIRE.—The last five or six weeks have been most propitious for the growing crops, and the whole country has now the appearance of great productiveness; perhaps there never was a more sudden change from comparative barrenness to luxuriance than has taken place during that time. The Wheat crops have improved astonishingly, and the Oat and Barley crops are remarkably fine; in fact, the latter are too luxuriant in many places, and the fears of their being laid are beginning to be realised by the heavy rain during the past night. Mangold Wurzel, with very few exceptions, is doing well; in some instances wire-worm and other insects have eaten off the roots, and in a great measure destroyed the crop; many of the early sown Swedes had to contend with severe attacks of fly, and in some cases resowing was resorted to; those which were fortunate enough to escape have done well, and the Turnip crop, upon the whole, is very satisfactory. Early Potatoes, most of which were severely injured by the frost, are later than usual, and the crops generally which are now being raised for the market are small, but as the second crop, which usually consists of transplanted Mangold Wurzel or Swedes, Green Melon, or other varieties of common Turnip, are of great importance, it is thought better to sacrifice a portion of the Potato crop than to run the risk of being too late with the second. The hay harvest is in full operation, excepting in some of the low cool meadows, and the crop is quite as good as could possibly be anticipated. Grass has increased upon the stocks of cattle, and the pastures have a fine rich appearance. Pleuro-pneumonia is still committing its ravages in some parts of the country. *W. P.*

WESTER ROSS, 16*th July*.—The weather that affords no room for the complaint of the farmer must, indeed, be good; and such was the month of June. So warm was it throughout, and so seasonable the showers, that the bad effects of a cold and protracted spring were well nigh done away with, and an abundant and not a late harvest was hopefully anticipated. But for the first 12 days of this month—a season when the most promising crop can be turned into a very dwarfish one—we had a very high temperature, without a drop of rain. Wheat, which promised formerly to be only an inferior crop, still further dwindled away, and now, in this whole neighbourhood, there are only a few fields bearing heavy crops, and these our heavy Carse lands. The likelihood, however, is that although our Wheat crop will be inferior in quantity, with the abundant sunshine we have had the quality will be fine. Barley and Oats, ere the drought set in, bespoke an abundant crop; but already in regard to many a field our hopes have been disappointed. For the higher and later districts, however, the abundant rain we have now had came in time, and more suitable weather than we at present enjoy could not be desired. A great deal will yet be done in the way of mending matters in the earlier districts; but the crops are so far advanced that straw cannot be ordinarily abundant. Swedes were very stiff in coming away, the ground being cold and damp, and in the process of singling many blanks were discovered, which in damp weather would have been easily remedied, but no sooner was a Turnip transplanted than it withered and died from lack of moisture. They are now, however, making rapid progress. Of all our other Turnips we have had an abundant braird, and they grow so quickly that the difficulty is in getting a sufficiency of hands for singling. A large breadth of Turnips has been sown, and a larger quantity perhaps than ordinary of guano, bones, and dissolved bones has been applied. Having suffered so much from the disease last year, a smaller breadth of Potatoes has this year been planted; but what we have present such a vigorous and luxuriant stem as if they had resolved on yielding to no disease, however formidable, at least for this season. We have been overtaken and arrested in the midst of hay-making by these anxiously longed for showers. A good part of it has been got into ricks in the best possible condition; the remainder remains exposed to the weather. This crop is generally light. Pastures are benefiting by the showers and the prospects of our stock are cheering.

Notices to Correspondents.

BEES: *W.* There is a tract published in Oxford, and which bears upon it that it is to be had at the Ashmolean museum on application to Mr. Duncan, which is as good a manual for cottagers as any.

ROOTS IN DRAINS: *A Reader.* We do not know what you refer to. If the risk is only incurred in part of the drain we would bed the tiles there in cement.

SUPERPHOSPHATE: *E. Durrant.* The sample is of a very poor superphosphate. It ought to contain from 10 to 12 of the soluble phosphate, and 10 to 15 of the neutral insoluble phosphate, besides 2 per cent. of nitrogen. 2 per cent. of the first, 15 of the second, and 1.15 of the third make a very poor manure, more especially from its deficiency in the first particular. If we value it on the principles indicated in page 226, vol. xii., "Eng. Agr. Soc. Jour.," we have

One-third of a ton of gypsum, at 20*s.*, say ...	£0	7	0
Insoluble phosphate, 335 lbs. at ¾*d.* per lb ...	1	0	0
Nitrogen = 33 lbs. of ammonia, at 6*d.* per lb. ...	0	16	6
making	£2	3	6

as the value of all the ingredients except the biphosphate, of which you have about 40 lbs. in the ton, and pay the difference = £3 6*s.* 6*d.* for it.

WATERPROOFING: *Theta* asks for a recipe for a composition which will render a rick cover waterproof, and at the same time not injure the cover, or cause it to rot or become mildewed.

WIREWORM: *Hepperstone.* They are said to be checked by pressure. Treading Wheat has saved it; we doubt if you will save Swedes in that way. Nothing that will not also kill the plants will poison them.

HAY-MAKING MACHINES.

THE ROYAL AGRICULTURAL SOCIETY'S PRIZE MACHINES are supplied by WM. DRAY & Co., Swan Lane, Upper Thames Street, London.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l.* 3*s.* The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s.* 6*d.* per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s.* 6*d.* per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

JAMES PHILLIPS AND CO. beg to call attention to their present reduced prices of Glass Milk Pans, Propagating Glasses, &c.

GLASS MILK PANS, packed in cases containing 12.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY AND WARING, Managers, 296, Oxford Street, London.

REDUCED TARIFF OF AGRICULTURAL AND HORTICULTURAL GLASS.

STRONG HORTICULTURAL SHEET, from 2d.; and HARTLEY'S PATENT ROUGH PLATE, from 4½d. per foot.

PERFORATED GLASS for Ventilating Dairies, Stables, &c., from 1s. 6d. per foot. German-shaped Milk-pans, 21s. per dozen; Hely's Test Churns, 5s. each; Waring's Butter Slabs, 10s.; Glass Fern Shades and Stands, from 3s.; Bee-glasses, from 6d.; Cucumber Tubes, from 1s.; Propagating Glasses, from 3½d. to 7s. each; Flower Labels, 7s. per 100; Aquariums, complete, 10s. each; and every other description of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign.—Catalogues free.

AT MR. MECHI'S ESTABLISHMENTS, 112, Regent Street, 4, Leadenhall Street, and Crystal Palace, are exhibited the finest specimens of British manufactures in Dressing Cases, Work-boxes, Writing Cases, Dressing Bags, and other articles of utility or luxury. A separate department for Papier Maché Manufactures and Bagatelle Tables. Table Cutlery, Razors, Scissors, Penknives, Strops, Paste, &c. Shipping orders executed. Superior Hair and other Toilet Brushes.

FOR WATERING GARDENS.

HANCOCK'S IMPROVED VULCANISED INDIA-RUBBER HOSE AND TUBING is now manufactured especially for the above purpose; is of greater flexibility than any other description of Hose; is capable of resisting great pressure, and made suitable for attaching to the mains of water-works, or to tanks of high elevations.

WATERING HOSE fitted up with the necessary *brass joints, stop-cocks, branches,* and *spreaders complete.*

VULCANISED INDIA-RUBBER SUCTION PIPES, made any length or size for Pumps or Garden Engines.

VULCANISED RUBBER WASHERS, and also in Sheet, any thickness, for all kinds of steam and water joints, or made any size or figure to order.

All communications and orders punctually attended to, addressed to the Manufactory, JAS. LYNE HANCOCK, Goswell Road, London.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by WAITHMAN & Co., Bentham, Lancaster.

No. 1 QUALITY, INCHES IN DIAMETER AND PRICE PER YARD:—½, 9d.; ¾, 11d.; 1, 1s. 1d.; 1¼, 1s. 3d.; 1½, 1s. 5d.; 1¾, 1s. 7d.; 2, 1s. 9d.; 2¼, 2s.; 2½, 2s. 3d.; 2¾, 2s. 6d.; 3, 2s. 9d.

SUPER EXTRA STOUT QUALITY:—2, 2s.; 2¼, 2s. 3d.; 2½, 2s. 6d.; 2¾, 2s. 9d.; 3, 3s.

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9d.; 1¼, 10d.; 1½, 11d.; 2, 1s.; 2¼, 1s. 3d.; 2½, 1s. 6d.

The Hose is Burnettised at an extra charge of 3d. per yard.

Union Joints, Branch Pipes, and Jets are also supplied.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

WITH WARNER'S REGISTERED SPREADER,

is strongly recommended, for durability and low price, viz., 2l. 19s., to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9s. upwards. Metallic String from 5d. to 1s. 3d. per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

Brass Syringes, 9s. to 18s.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

THE BEST PROTECTOR FROM THE HEAT OF THE SUN.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

LIST OF GARDEN ORNAMENTS MANUFACTURED BY

AUSTIN'S ARTIFICIAL STONE, at Nos. 1 to 4 Keppel Row, New Road, Regent's Park, London.

210 varieties of Vases and Tazzas, at prices varying from 15s. to 30l.
94 Statues and small Figures.
38 figures of Animals.
17 " of Birds.
16 Baskets of suitable Pedestals, prices from 12s to 36l. Some of these are beautiful ornaments for lawns.
12 different patterns of Flower Boxes for Windows, &c.
4 Garden Seats.
15 Sun-dial Pedestals.
16 Shells for either Water or Rock Plants; the largest size is 12 feet diameter.
Pedestals, square, circular, and octagonal, of almost every size. N.B. These are always perforated, to allow drainage from a vase.
43 Groups of Figures, single Figures, or Architectural Flowers, designed for centre ornaments of fountains.
Ornamental Copings to Ground Basins of Fountains, from 37 feet diameter to any smaller size.

FOUNTAINS.

AUSTIN & SEELEY having erected 218 of these works in various parts of the kingdom since the year 1836, may be presumed to have more experience than any other persons engaged in such work. Their collection now comprises about 200 designs, some of which are of the highest class; and they are now paying special attention to this department of the business, in the expectation that the local water works in course of erection will facilitate the supply of *jets d'eau.* The prices range from 10l. to 400l.

CHASE'S BEETLE POISON, entirely free from danger to Human Life, and perfectly harmless to Cats and Dogs. All persons who may be annoyed with Black Beetles or Cockroaches will find the above Preparation a most effectual, safe, and speedy remedy for their removal; one trial will prove its great efficacy: One Box will Destroy Thousands. The peculiar advantages in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.

Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.

Sold in boxes at 1s. each, by THOMAS CHASE, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all wholesale medicine vendors.

To the Editor of the "Cottage Gardener," July 3d, 1855.

"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*

(ED.—This is not a mere puff, but sent to us by a gentleman who has been benefitted as he states.)

GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7d. per yd.	5d. per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1⅝-inch " light "	...	8 "	6 "
1⅝-inch " strong "	...	10 "	8 "

PRUDENCE.

HOW much pain, regret, and evil may be avoided by timely forethought! If it be desirable to economise money and time, is it not still more important to economise our health?

The prudent man pays attention to the slightest derangement in his physical organisation. When he finds himself "out of order," he should resort to the world-famed remedy, PARR'S LIFE PILLS, and thus the incipient malady will be checked.

In all quarters of the globe the reputation of PARR'S Life Pills is fully established; and it is a fact, that no "household words" are more familiar with the people than those of the invalid, who speaks of health restored as the consequence of using PARR'S Pills.

☞ Ask for PARR'S Life Pills.

Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in town and country. In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in family packets 11*s.* each. Directions with each box.

MEDICAMEN VIRTUTIBUS FLORENS.

MEDICINE EXTRAORDINARY! DR. ARNOT'S PILLS.—The miraculous effects of this new discovery in Medicine is so extraordinary, that it has taken the public by surprise. It strikes at once at the root of disease, by creating a new and sanatory state of the blood and other vital fluids, through the medium of the DIGESTIVE ORGANS, by which means the morbid conditions of the body are immediately removed. It moreover strengthens the constitution, and speedily restores the patient to HEALTH. Its marvellous curative properties will be seen by a trial.—In boxes at 1*s.* 1½*d.* Depôt, 50, Rathbone Place, London. Order through any chemist. By post for 14 stamps.

THE COMING PILL.—"THE RIGHT PILL FOR EVERY COMPLAINT!"—PAGE WOODCOCK'S WIND PILLS for Wind in the Stomach, Indigestion, Biliousness, Liver Complaints, and all diseases arising from a disordered state of the Stomach and Bowels, will beat the World for efficacy! Try them, and you will say you have got the right Pill this time.—Sold by all respectable Medicine Vendors everywhere, at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* If difficulty occur in remote places, send stamps to PAGE D. WOODCOCK, Lincoln, and you will have them by return of Post.

HOLLOWAY'S OINTMENT AND PILLS REMARKABLE FOR THEIR EFFICACY IN CURING DISEASES OF THE SKIN.—Scurvy, Ringworm, and other Cutaneous disorders are engendered by the impurity of the blood, and the only sure means to eradicate such complaints is to undergo a course of HOLLOWAY'S PILLS, and at the same time to apply externally his invaluable OINTMENT. Cures by these extraordinary remedies are daily attested, proving their astonishing efficacy in purifying the blood, strengthening the constitution, and re-establishing the best of health. They are equally beneficial in curing Wounds, Sores, and Glandular Swellings; they are therefore strongly recommended to persons so afflicted.—Sold by all Medicine Vendors, and at Professor HOLLOWAY'S Establishments, 244, Strand, London; and 80, Maiden Lane, New York.

ISLE OF MAN.

THE ESTABLISHMENT for the EDUCATION of YOUNG LADIES, conducted by the Misses KAYLL, assisted by the most eminent masters, commends itself to the notice of parents desirous of obtaining for their Daughters a first-class Education in the most healthy part of Great Britain.—For terms, &c., apply by letter, addressed Derby Square, Douglas, Isle of Man.

The duties of the School will be resumed on the 15th of August.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Note-paper made from Straw, 2*s.* 6*d.* per ream; Envelopes, 4*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free. LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

TO FARMERS, COWKEEPERS, BUTTER-MERCHANTS, AND OTHERS.

WANTED, about 200 Quarts of MILK per day, to be delivered in London twice a day; and about 100 lbs. of BUTTER, and from 500 to 1000 EGGS per week, to be sent twice a week. Also an active LAD wanted, able to read and write.—Address, with full particulars and terms (for ready money), ALPHA, Office of this Paper.

TO NURSERYMEN, FLORISTS, SEEDSMEN, FRUITERERS AND GREENGROCERS.

TO BE LET on LEASE for seven or more years, or the Lease for 90 years to be disposed of, about 3¼ miles from Hyde Park Corner, a good DWELLING HOUSE, with Business Premises, with a Show House or Conservatory and Shops, connected on the side of a main road, the greatest thoroughfare out of London. There is about an acre of ground attached to the house premises nearly all covered with Glass, and erected since 1840. The houses are well calculated for the Culture of Plants for market, and all warmed by hot-water. The advertiser is relinquishing business, and would not require the whole of the valuation for the Lease, &c., to be paid down, if proper security can be furnished.—Apply for further particulars to Mr. KENNEDY, Bedford Conservatory, Covent Garden.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, an extremely desirable piece of Garden Ground, containing 27 acres, eight of which are under Fruit Trees in full bearing, and the remainder under general crops, in a fine state. Absolute possession at Michaelmas, but partial possession sooner if required. Coming in very moderate.—Apply to Mr. HARWOOD, Surveyor, 4, Coleman Street Buildings, Moorgate Street, City.

TO BE LET, with possession at Michaelmas next, a very useful Turnip and Corn Land Farm of 330 acres, well situated in the county of Essex, together with capital House and commodious Farm Buildings.—For rent and particulars, apply to Mr. PARTRIDGE, Land Agent, Great Braxted Hall, Witham, Essex.

TO GENTLEMEN'S GARDENERS, FLORISTS, OR SMALL CAPITALISTS.

TO BE SOLD, a first-rate old-established FLORIST'S BUSINESS, about nine miles from London and within half a mile of a good Market town. Rent moderate; a first-rate stock, House, Box Light Tools, &c., to be disposed of very reasonably. This is a good opportunity that seldom offers, as a person well acquainted with the trade is willing to take the management with any person commanding from 200*l.* to 300*l.*—Address, Mr. HOOK, 21, Brudenell Place, New North Road, Hoxton.

WHITE PERUVIAN MUSK-DUCKS.

TO BE SOLD, a few Pairs of DUCKLINGS, bred from the beautiful birds Mr. WARWICK exhibited at the Windsor Show, and which were purchased for her Majesty's aviary. Price 2*l.* 2*s.* per pair. Also a DORKING COCK and SIX HENS from the best stock. Price 5*l.* Basket and carriage to London included.—Apply to Mr. WARWICK, Donyland Lodge, Colchester.

Sales by Auction.

SPECIMEN STOVE AND GREENHOUSE PLANTS.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, July 24, at 12 for 1 o'clock, a collection of STOVE and GREENHOUSE PLANTS, including the Exhibition Specimens grown by Mr. Speed of Edmonton.—May be viewed on the morning of sale, and Catalogues had.

SPECIMEN HEATHS, ETC.—CLAPHAM PARK.

MR. J. C. STEVENS is favoured with instructions to sell by Auction, on the premises, on TUESDAY, 31st July, at 12 o'clock, the collection of Specimen Heaths and Azaleas, the property of the late Wm. Hy. Gilliat, Esq., of Clapham Park, including some of the finest Plants in the country. Also the house in which they have been cultivated.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. STEWART, the Head Gardener on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

SUPERIOR DOWN COTSWOLD RAMS.

MESSRS. T. MALLAM AND SON have received instructions from Messrs. Druce, of Eynsham, near Oxford, to sell by Auction, on WEDNESDAY, the 8th day of August, at 11 o'clock, in a Close near Worcester College (being the Monthly Cattle Market at Oxford), about 40 SUPERIOR SHEARLINGS, and a few older Sheep. The Auctioneers feel called on to observe that these Sheep will be found full of flesh and wool, and have been bare shorn; and that this Stock has carried off the first prizes at the Smithfield Show in 1853 and 1854, also three prizes at the Exhibition in Oxford in June last.

IN BANKRUPTCY.
RE JOHN MITCHELL, WARMINSTER, WILTS.
TO CONTRACTORS, BUILDERS, AND OTHERS.

MESSRS. DAVIS AND VIGERS are honoured with instructions from Mr. Commissioner Fane to submit to Public Auction, at the London Inn Yard, Warminster, on FRIDAY, July 27th, at the Smithy, Masons' Arms Yard; and on SATURDAY, July 28th, at the London Inn Yard, Warminster, at 11 for 12 o'clock, 34 powerful young Machine Horses in excellent working condition, a valuable Hunter, two Ponies, and a useful Cob; five strong road Waggons, six Carts, two Timber Carriages, two useful Dog Carts, one Chaise Cart, 50 sets of Hill and Trace Harness, 30 Horse Cloths, Corn Bins, Chaff-boxes, and Stable Implements; also two 5-ton Travelling Cranes, nine casks of Cart Grease, 16 dozen new Shovels and Spades, 1½ ton of Railway Spikes, Clout Nails, Horse Nails, &c.; 10 tons of Wrought and Cast Iron Chain, Couplings, &c.; Portable Forge, Forge Tools, Navvy Barrows, Wheeling Planks, Picks, Crowbars, and numerous items of considerable value, collected and removed from the works for the convenience of sale.—May be viewed the day previous and morning of sale, and Catalogues had of Messrs. PATERSON and LONGMAN, Solicitors to the Fiat, 68, Old Broad Street, London; at the Red Lion Inn, Salisbury; the Angel Inn, Heytesbury; the Deptford Inn, Wiley; the London Inn, and Masons' Arms Inn, Warminster; and of the Auctioneers, 3, Frederick's Place, Old Jewry, London.

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be: and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Britannia.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, the soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. [illegible], Victoria Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, July 21, 1855.

They are fit to travel anywhere.—R. RICHARDSON, 21, Tonbridge Place, New Road, London: maker of portable houses, summer houses, poultry houses, &c.

TO NURSERYMEN AND GARDENERS.
REIGATE SILVER SAND, 12s. per ton, 1s. 6d. per bushel, or 16s. per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2s. each. Kentish and other Peats and Loam of excellent quality.
KENNARD BROTHERS, Swan Place, Old Kent Road.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.
THE BEST PROTECTOR FROM THE HEAT OF THE SUN.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of ELISHA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.
May be obtained through any ironmonger; or of JOHN WARNER & SONS, 8, Jewin Crescent, London.
N.B. Sold in casks containing 14 or 7 gallons, at 2s. per gallon. Casks (which cannot be returned), 5s. and 3s. each.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.
Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists and all interested in Gardening pursuits are invited to examine DEANE, DRAY, AND CO.'S extensive Stock of GARDENING and PRUNING IMPLEMENTS, best London-made Garden Engines and Syringes, Colebrook Dale Garden Seats and Chairs.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
KENSAL GREEN, HARROW ROAD, LONDON.

JOHN TAYLOR AND SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & SON have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

JAMES WATTS, HOTHOUSE BUILDER, 3, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in., 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready, glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

No. 11	„	16	„	„	40	„ ...	4 0
No. 12	„	24	„	„	45	„ ...	5 0
No. 14	„	30	„	„	45	„ ...	5 18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, $1\frac{1}{2}$ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, $1\frac{3}{8}$ inch, 12*s.*; No. 3, do., diameter of barrel, $1\frac{3}{8}$ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

JOHN WARNER AND SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
WITH WARNER'S REGISTERED SPREADER.

is strongly recommended for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

JOHN WARNER AND SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

All articles of JOHN WARNER & SONS' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

JOHN WARNER & SONS having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of liquids.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

COTTAM AND HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stands, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, or GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the late E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2*s.* 6*d.* each, or free by post, 4*s.*

MANUFACTURED BY
JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale Agents:
W. THOMPSON & SON, 15, Upper North Place, Gray's Inn Road, London.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1*s.* each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Typhoid Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS,

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each. Also choice CINERARIA seed saved from the finest named varieties, at 1*s.* 6*d.* and 2*s.* 6*d.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

MAJOR'S CALCEOLARIA SEED.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to inform his friends that his Calceolaria Seed for this season is now ripe, and may be had in packets at 2*s.* 6*d.* and 5*s.* each. The 5*s.* packets will be equal to three 2*s.* 6*d.* ones. The seed is produced from rich and beautiful varieties (for which his collection stands unrivalled), therefore large, well-formed flowers, and beautiful colours and markings may reasonably be expected. The present, up to the latter end of August, is a proper time to sow to insure an early spring bloom. Postage stamps are requested in return.

PRIZE CALCEOLARIAS.—A few packets of seed saved from the group of Seedling Calceolarias to which a Prize was awarded at the Great Exhibition at the Crystal Palace, are now ready at 10*s.* 6*d.* each. These seedlings are unrivalled for immense size of flower, richness of colour, and strong vigorous growth. Seed from other Choice Seedlings at 5*s.* per packet.

Address to WILLIAM SANFORD, Gardener to Mr. Henchman, Edmonton, near London. No letter will be attended to unless enclosing a Post Office Order or Postage Stamps.

CALCEOLARIA AND CINERARIA SEEDS.

GEORGE CLARKE has again the pleasure of offering seed of his unrivalled collection of CALCEOLARIAS. From their well known merit, and many testimonials received in their favour, little need be said in their praise. Many of them can still be seen in bloom at the Nursery. Great care has been bestowed in the saving, so that none but first-rate flowers can be expected. Packets, price 2*s.* 6*d.* and 5*s* each.

Also CINERARIA, saved from none but the finest flowers and, like the Calceolaria, is warranted to give satisfaction Packets, price 2*s.* 6*d.*, payable in postage stamps or otherwise.

Streatham Place Nursery, Brixton Hill, near London.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, July 28.

CUTHILL'S STRAWBERRY PLANTS.—The early and hardy BLACK PRINCE, and late PRINCE OF WALES, two celebrated sorts, will be sent out on and after August 15th. They are both enormous bearers, and either of them makes a most delicious and solid preserve, to which upwards of 300 ladies round here can testify. The Black Prince, 5*s.* per 100: the Prince of Wales, 7*s.* 6*d.* per 100.

J. C.'s Pamphlet on the Potato, Strawberry, Asparagus, Seakale, Rhubarb, Wine, do. Preserve, 2*s.*

J. C.'s Market Gardening round London, 1*s.* 6*d.* See the recommendation of it in the "Quarterly Review." Early orders requested. Post-office orders payable at Camberwell Green.

JAMES CUTHILL, Camberwell, London.

LISIANTHUS RUSSELLIANUS.

AN AMATEUR having raised from Seed a considerable number of the above beautiful plant over and above what he will require for his own flowering, begs to offer them on the following reasonable terms:—

For 12 Plants	12*s.*
„ 25 „	20*s.*
„ 100 „	50*s.*

The Plants are potted singly in small 60-sized pots, and for the convenience of Purchasers they are placed for distribution in the hands of Mr. J. VEITCH, Jun., Exotic Nursery, Chelsea, to whom all orders and payments for them are to be addressed.—July 28.

HIGHGATE NURSERIES, NEAR LONDON.

WILLIAM CUTBUSH AND SON beg to inform their numerous patrons and friends that their annual importation of HYACINTHS, &c., will arrive the first week in September. Catalogues will be ready about the 20th August, and will contain a selection of all that is really good.

Wm. C. & Son need not mention the quality of their bulbs, it being sufficient guarantee in the awards being made to them at the Horticultural Society's Rooms, Regent Street, last spring.

Catalogues postage free on application.

TO AMATEURS IN CONIFERÆ.

MR. BARRON, of Elvaston Castle, can supply a few strong PLANTS of PICEA NOBILIS, upwards of three years old, which have never been in pots, hence the roots are what they should be. The only Seedling Plants (of this the most beautiful of all Firs) that have ever been raised since its first introduction to Europe. They will be sent out in the middle of September, the best plants to the earliest applicants. The largest size 63*s.*, and the next 42*s.* Notice will be given before the Plants are sent out, when a remittance will be required from unknown correspondents.

NEW CABBAGE.—THE CHAMPION OF ENGLAND, which has surpassed everything of its kind during the past severe winter (when nearly every other has failed) and turned well into Cabbage this spring. This Cabbage is of a very dwarf and compact habit, and quite equal in flavour to any yet grown. It has been in the hands of a very excellent gardener for several years, and he has thoroughly proved its superior hardy and good qualities. The stock of seed purchased is very limited, therefore none can be sold by the pound or in large quantities to the Trade this year. E. T. feels confident, from what he has seen of the Cabbage, that it will give the greatest satisfaction to all purchasers. Sold in packets of 1 oz., 2*s.* 6*d.*; or of half an ounce, 1*s.* 6*d.*, postage free.

The TRUE OLD BATH COSS LETTUCE, which Lettuce has never been surpassed by any other yet grown. 1*s.* per packet.

This being the proper time for sowing the following varieties of Hardy Flowering Seeds for blooming next spring, the following undermentioned varieties will give the greatest satisfaction to all purchasers as they have hitherto done for many past seasons:—

SWEET WILLIAM SEED—Saved from 50 of the choicest and most superb varieties. 1*s.* per packet.

ANTIRRHINUM SEED—Saved from all the striped, spotted, and finest shaped varieties. 1*s.* per packet.

Superb HOLLYHOCK SEED—Saved from all the best named flowers our last year. 1*s.* per packet.

SCARLET GIANT BROMPTON STOCK, extra fine. 1*s.* per packet.

PANSY SEED—A few packets from selected varieties. 1*s.* per packet.

AQUILEGIA OR COLUMBINE SEED—Saved from 12 distinct varieties. 1*s.* per packet.

Either of the above packets of Flower Seeds three for 2*s.* 6*d.*

A remittance must accompany every order either in cash or penny postage stamps, when the whole, or any part of the above (as the case may be) will be forwarded.

EDWARD TILEY, Nurseryman, Seedsman, and Florist, 14, Abbey Church Yard, Bath, Somerset.

HOLLYHOCK SEED.

A. PAUL AND SON have ready for immediate sowing a fine lot of HOLLYHOCK SEED saved from their choicest varieties which have obtained many of the leading prizes during the last three years:—

	s.	d.
1st selection, saved from 25 varieties, per packet ...	5	0
2d do. „ 12 „ „ ...	2	6
Good Mixtures	1	0

Also, price 1*s.*, AN HOUR WITH THE HOLLYHOCK.

N.B. Free by post, and payment received in postage stamps.

Nurseries, Cheshunt, Herts.

TO LOVERS OF PLANTS WITH HANDSOME FOLIAGE.

MESSRS. STANDISH AND NOBLE are now sending out the fine new Greenhouse Evergreen, WEINMANNIA TRICOSPERMA, which for beauty of foliage cannot be surpassed. It was exhibited at the Royal Botanic Society's Meeting in June last, and also at the Crystal Palace. From the report of the latter exhibition, the following brief description is condensed:—"You might pass off the leaves of this beautiful plant for the fronds of a handsome Fern. They are compound and pinnate, just like Fern leaves. I do not recollect, even among Mimosas, a plant with more beautiful leaves than this." We may add that it is of good habit, and easily cultivated; and from being a native of Valdivia, it may possibly be hardy.

Strong plants, 21*s.* each.

The Advertisers have just published a new Catalogue, which will be forwarded free by post on receipt of a penny stamp.

The Nurseries, Bagshot.—July 28.

CHOICE NOVELTIES OF THE PRESENT SEASON.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, is now sending out nice healthy established Plants of the following at the reduced prices annexed.

FUCHSIAS, with white corollas, at 3*s.* 6*d.* each:—Story's Mrs. Story, Queen Victoria, Water Nymph, Empress Eugenie, Lady of the Lake, and Snowdrop. Other varieties of this season:—Bank's Prince Albert, 3*s.* 6*d.*; Beauty of the Bower, 2*s.* 6*d.*; Maid of Kent, 3*s.* 6*d.*; Climax, 2*s.* 6*d.*; Grand Sultan, 2*s.* 6*d.*; Omer Pacha, 2*s.* 6*d.*; Smith's Omer Pacha, 2*s.* 6*d.*; Nimrod, 2*s.* 6*d.*; Coronet, 2*s.* 6*d.*; Orlando, 2*s.* 6*d.*; and Viola-flora pleno, 2*s.* 6*d.*, or 30*s.* per dozen; post free, where two or more are ordered. VERBENAS:—Wonderful, Blue Beard, Lady Lacon, Commander-in-Chief, Empress of France, Florence Nightingale, Rose of England, Tyrian Prince, Eva, Boule de Feu, Lord Raglan, Empress, Mrs. M'Neil, Violacea, Silistria, and Mrs. Woodroffe, at 1*s.* 6*d.* each or 18*s.* per dozen, post free.

A remittance respectfully requested to accompany all orders (unless reference is given), payable at Marsden, Lancashire.

For List of Choice new Achimenes, and other novelties of this season, see Advertisement in *Gardeners' Chronicle* of July 21 and previous Numbers.

NEW AND RARE PLANTS.

JOHN AND CHARLES LEE have a fine stock of the following to offer:—

FILBERT MERVEILLE DE BOLWYLLER, large and very prolific, 7*s.* 6*d.*

The Trade supplied.—Nursery, Hammersmith.

NEW INDIAN AZALEA, "EULALIE VAN GEERT."—This fine and distinct variety may be recommended as one of the best of this fine tribe of floricultural plants, and which has been admired by all the amateurs who saw it in bloom. It is of free growing and robust habit. The flowers of the largest are of good form and substance; colour rose and white, spotted with bright rose. Plants will be sent out next spring at 7*s.* 6*d.* and 21*s.* each, one over for every three taken; the first subscriber will, of course, obtain the best plants. Orders will also be received at my Agent's, Mr. R. SILBERRAD, 5, Harp Lane, Tower Street, London, from whom my Catalogue of Plants may be obtained on application.—N.B. The plants will be delivered free to London: see opinion in *Gardeners' Chronicle* of May 26th and it will be figured in the works of Messrs. Van Houtte and A. Verschaffelt of next month.

A. V. G. also begs to offer the following new and recommendable plants at reduced prices.

PRICED CATALOGUE OF PLANTS.

THOMAS JACKSON AND SON'S Priced Catalogue of Plants may be obtained on application. It contains Stove, Orchidaceous, Ferns and Mosses, Greenhouse, Ornamental Shrubs and Trees, Roses, and Herbaceous Plants.

T. J. & SON are offering at very low prices a large Stock of Azaleas, Camellias, Ericas, Epacrises, Helichrysums, Rhododendrons, &c., well deserving the attention of purchasers.

Nurseries, Kingston, Surrey.

The Gardeners' Chronicle.

SATURDAY, JULY 28, 1855.

The BEST SEASON for TRANSPLANTING EVERGREENS, although beginning to be more generally agreed upon than formerly, still remains a question on which opinions differ. Of late years the practice advocated by Mr. GLENDINNING, of selecting for this purpose the month of September, has been adopted in England with marked success. We need not here go into the reasons why this month should be selected; they are fully given in the "Theory and Practice of Horticulture," to which the reader desirous of understanding all the bearings of the question is referred. It is enough to say that the great fitness of the latter part of September, long since pointed out by HORACE WALPOLE, himself a planter of no small experience, is shown by repeated experiments by MARRIER DE BOIS-D'HIVER, at Fontainebleau, and others, instituted for the express purpose of settling a matter so long in dispute, to be on the whole the best.

Our present object is to show the opinion of French gardeners upon this subject; an opportunity for doing which is afforded by a little discussion that has taken place in the "Revue Horticole."

Last May, M. LABARRE, gardener to the BARON DE POILLY, at Folembray, a place, we believe, not far from the Belgian frontier, gave an account of the result of his practice in removing evergreens of considerable size. The substance of his report was as follows:—1. In the spring he removed a Yew 13 feet high, with a head in proportion. It took so well that even an experienced gardener could not have known, in the course of the same year, that it had been transplanted. 2. In the following autumn he had to move eight Spruces and two Scotch Firs; all failed. 3. The next year, again in the spring, another Yew was transplanted, as large as the first, and with the same success. At the same time he planted 170 other evergreens, of various kinds. On the 15th March he planted 20 Spruces and six Yews; the last were 15 feet high with heads in proportion, each required 10 people to move it, and all were expected to die. But all lived, although Mr. LABARRE adds, "the soil into which they were put made their loss probable enough; for it was full of stones, and consisted of white sand mixed with a little vegetable mould." (Why this should be unfavourable soil is not explained. Suppose it had been clay!) On the 7th April 34 Norway Spruces and 10 white Spruces (*Sapinettes*) were planted, from 6 to 10 feet high. They had been raised in the nursery in grey sand, and M. LABARRE was astonished at the beauty of their growth in such soil (why?). Only two of the Norway Spruces died. In conclusion he explains how he watered these trees. Each Yew planted in March received a potfull of water when first planted, then four times as much, and this was repeated several times during the first month. In the April planting, there being at that time a drying wind, the holes were only three-quarters filled, and each tree received two potsfull of water. Afterwards each hole was filled in so as to remain a basin, and watering was repeated during the continuance of the drought.

To this statement M. CARRIÈRE, whose work on Conifers was noticed the other day (p. 445), opposes some counter experience. 1. He says that he was obliged last year to take up, in the end of August, some Chinese Arbor-Vitæs more than 15 years old, and mostly above 6 feet high; they were removed carefully to a trench, the soil of which was well watered before it was filled in, and they suffered so little that no one could distinguish them from the others which had not been removed. 2. A similar operation was performed in the spring of 1854 with other Chinese Arbor-Vitæs of about the same size, and a great many died notwithstanding all the care that was taken of them. 3. Last September he potted 280 Yews without any other care than plunging the pots and covering them with leaves; not one missed. But upon performing exactly the same operation upon evergreen Cypresses, loss was experienced to the extent of about one-third—a circumstance which M. CARRIÈRE inclines to attribute to the well-known difficulty of transplanting that species when it is simply "drawn" (*arrachée à racines nues*) before transplanting.

Upon this result M. CARRIÈRE remarks that it is

sufficient to show what is the most economical and consequently the most advantageous when work has to be done on a large scale, from which point of view alone he thinks it necessary to look at the question. This is very different from the small operation of making an ornamental plantation. In the latter case expense is of little consequence; in the former it is of the first importance. This consideration touches the root of the inquiry. Can, he inquires, anybody afford in extensive works the care, the cost, and the frequent watering which M. Labarre gave his trees? Are we then, he adds, to jump to the conclusion that autumn planting is *always* better than that of spring, or that, as M. Labarre contends, it is *always* best to plant in spring. "Both conclusions would be equally erroneous; for unless we take into account all the different circumstances which attend such an operation, and which may lead to the adoption of one season rather than another, we do nothing worth doing. To think of submitting all trees, however much they may resemble each other, to the same kind of cultivation, would be like a doctor's giving the same dose and the same drug to all his patients, without paying attention to their different temperaments." He, however, insists upon the general fact that *autumn planting*, or *that which takes place at the end of summer is the most advisable.*

"In places near the sea, where the sky is often overcast and the air is almost always saturated with humidity, and the earth is consequently always damp, it is easy to understand that there may be some advantage in planting in March or April, or even in May, that is to say at a time when the air has warmed the soil. The same may be conceded of countries where the winters are long, or where heavy autumnal rains are constant, for in such places the roots may rot before getting hold of the ground, and trees may perish from want of power to vegetate before the arrival of bad weather."

Such are the opinions of M. Carrière, who is therefore, like us, a strenuous advocate of autumn planting in England, to which country none of the objections apply which are adverted to in the latter part of the foregoing extract. Of course it may for many reasons be *inconvenient* to plant in autumn; but that is a point not in discussion. It is often inconvenient to do what is right in other operations besides gardening; but principles must not give way to considerations of convenience.

The ravages committed by the Gooseberry Caterpillar this year in the neighbourhood of London have been most formidable. Whole acres of bushes in the market gardens are at the present time as bare of leaves as if it were the middle of winter, and so rapidly does wholesale destruction take place that a plantation healthy and promising to-day may be leafless a few days hence. Instances have even been noticed of bushes being divested of their foliage in a single night.

This scourge made its first appearance this year with the pushing of the leaf in spring; for some time it caused much damage, but then disappeared; about three weeks ago, however, it commenced a far more extensive and serious attack, and since then the losses have been enormous. In the Fulham fields the Messrs. Bagley, Matyear, Wilcox, and all the great market gardeners have suffered to a greater or less extent. Some have even commenced pruning and thinning their bushes, but this is done, we believe, more for the purpose of admitting light and air to the surrounding crops than with the view of arresting the progress of the caterpillar, which since the heavy rains we have lately experienced has of its own accord disappeared.

The destruction committed, however, bad as it is in the Fulham fields, is slight compared with that in the market grounds in the neighbourhood of Isleworth, Brentford, and Ealing. Mr. Manser, an extensive fruit grower close to Kew Bridge, has had 6 or 7 acres of bushes entirely stripped of their leaves, and in his case not only Gooseberries, but many of the red Currant bushes have also suffered; the latter, however, to a small extent compared with the former. So complete, indeed, has been the destruction here that Mr. Manser has had great quantities of his bushes grubbed up, leaving, however, in some places rows standing wide apart to see what they will produce next year. In examining the different plantations it was curious to observe how much fonder the caterpillar had evidently been of the foliage of young bushes than of old ones. Some of the latter, indeed, averaging from seven to nine years old, had quite escaped, while young trees close by had been completely divested of their more tender, large, and succulent leaves.

Few remedies have been tried; the caterpillar has gone away of its own accord, and a fourth outbreak (for the last is said to be the third) is not expected. Some have endeavoured to stop its ravages by handpicking; but that has been found to be ineffectual, as well as costly. Others have tried soot and lime mixed, and soot mixed with ashes; but soot alone has in most cases been found to be best, and if carefully and perseveringly applied it certainly appears to have the effect of keeping the caterpillar in check, and of preserving the leaves. This is well exemplified in the grounds of Mr. Dawes, a market gardener on the Brentford Road, about half-way between Turnham Green and Kew Bridge, who applied soot incessantly, and whose plantations are comparatively green and healthy, while Mr. Noy and his other neighbours have suffered severely. This remedy is easily procured and inexpensive. It is best applied early in the morning while the dew is on the trees, or perhaps after a shower. The only drawback it has is that it makes the fruit dirty and unsaleable; that difficulty can, however, be overcome by washing or employing other means for cleaning the fruit. But even if the crop of fruit is spoiled the remedy is valuable, because it will probably ensure the crop of next year by keeping the leaves on the bushes; without them, it need scarcely be stated, the young wood does not ripen, and not only is the crop of the present season lost, but there can be little, if any, next year. A knowledge of the latter fact, founded on experience, is what has induced Mr. Manser to grub up his trees at once, and throw them away. The dressing of soot is better.

But are dressings of any kind the true remedy? Would it not be better to attack this mischievous enemy in its hiding places before it has time to reach the Gooseberry bushes. The habits of the insect appear to suggest a ready means of destroying it. Our valued correspondent "Ruricola" thus spoke of it in 1841.

"The flies emerge unheeded from their tombs the beginning of April, and the female soon deposits her eggs close to the sides of the principal nervures on the under side of the leaves (fig. 2), which is very remarkable, for all the females of this extensive family are furnished with an instrument called the saw, for the purpose of cutting into the leaves and stalks, and introducing the eggs between the cuticles, or under the bark. In about a week the larvæ hatch, and commence feeding on the leaf on which they are stationed, and soon riddle them full of small holes; thus they go on feeding and changing their successive skins as they increase in size, until they are three-fourths of an inch long, when they are seen scattered round the edges of a partly-demolished leaf, holding by their fore legs, with their tails turned up, or lying on one side."

"There seems to be a succession of broods, from the early spring until October occasionally; but the

greatest numbers are congregated in May and the beginning of June, when, I understand, they have caused 20*l.* to 30*l.* damage in a market-garden near London, in one season; but in the neighbourhood of Blandford, last year, the second attack upon the Gooseberry-bushes in July and August was, if possible, more devastating than the first. Having defoliated a bush, leaving nothing of the foliage excepting the footstalk, and sometimes a portion of the main rib, and being arrived at maturity, they cast their skins again, and then lose all their black spots, becoming of a uniform pale green, with two little black dots on the head, the spaces behind it and towards the tail retaining the yellow tint. After resting awhile they descend into the earth and spin a yellow brown cocoon, formed of silk and gluten of so thick a texture, that it is impervious (fig. 4); from these the summer broods of flies come up in less than three weeks, but the autumnal ones remain in them, curled up in the larva state, until the following spring, when they change to pupæ in time to produce flies, as the Currant and Gooseberry trees are coming into leaf."

Hence it is evident that the pupæ into which the caterpillars change when they disappear are to be found in the earth at the foot of the bushes. "Ruricola," therefore, recommended that this earth, to the depth of a couple of inches, should be carefully removed after the caterpillars have gone down; to which we would add, that it should be mixed with the heaps of weeds and rubbish collected in all gardens, and burnt there. Mere removal, it is to be feared, would be ineffectual, because the flies, when they emerge from the ground in the spring, would soon discover the proper places in which to lay their eggs, even although they are born at a distance. The plan in question is mentioned by one of our correspondents as having been successful, as it necessarily must be, and it has the further merit of being unattended by any expense beyond a little labour. Another correspondent speaks of having caught the flies at their first appearance after being hatched, before they had time to lay their eggs, and this is no doubt a method much to be commended; the only objection to it, indeed, is that the flies are apt to be overlooked and troublesome to catch; whereas removing the earth where they lie perdue, and destroying them before they can hatch is attacking the evil at its source.

As the caterpillars have now gone down into the earth, there seems to be no reason why the work should not be performed at once, instead of being delayed till the spring. Immediate action has at least this merit, that it prevents the operation from being forgotten or deferred till it is too late.

VEGETABLE PATHOLOGY.—No. LXXXII.

This article is unavoidably omitted this week from want of room.

PARISIAN HORTICULTURAL EXHIBITION.

(From our own correspondent.)

The "Imperial and Central Horticultural Society of Paris," formed in December last by the union of two rival societies then existing in the town, determined on holding an "Universal Horticultural Exhibition" at the time of the General Industrial Exhibition of 1855, to be established as nearly as possible on a similar plan. Unlike our own exhibitions, where the plants, only remaining exposed a few hours and restored to their homes before night, need no protection beyond moveable tents, they were here to remain for several months, and required more permanent arrangements for their protection and exhibition. For this purpose the Society obtained a plot of ground amongst the trees of the Champs Elysées opposite the Palais d'Industrie, of the extent of about 2½ acres. It was fenced in and laid out on the designs of Mr. P. Loyre, landscape gardener, of Paris; a pair of handsome iron gates were erected at the entrance by Mr. Roy, of Paris; plant-houses and other structures were built for the reception of such objects exhibited as could not remain in open borders; awnings and tents of various designs were put up to shade such of the flower beds as required them; shrubberies were planted as a screen within the outer fence; creepers trained up the unsightly stems of the old trees; lawns laid down, a piece of water, fountains, ornamental vases and statues, &c., added, and the admirable taste displayed in the grouping of the several parts, with the fine background afforded by the gardens of the Elysée palace, give to the whole a most pleasing effect, particularly striking as you enter from the Champs Elysées.

This general effect, together with the tasteful arrangement of the minor details, are indeed the features which most immediately call forth our remarks and approbation; for, in the beauty of individual specimens, and the horticultural skill they evince, there are few that can enter into competition with what we see at our own shows. But this comparison is scarcely fair. It is an affair of considerable expense to exhibitors to keep up a succession of plants in flower during any lengthened period of time, and notwithstanding the care bestowed on them by the Society's gardeners, specimens of value may receive essential injury, when long absent from their accustomed homes. The doubt whether these losses may be adequately compensated by rewards or assistance received from the Society, or by the credit or custom which may accrue, must naturally deter exhibitors from sending such costly specimens as almost exclusively constitute the collections of stove and greenhouse plants at the Chiswick shows.

In order to convey a better idea of the details of the arrangement, I enclose a copy of the plan published by the Society in their weekly catalogue. The dots arranged in rows at regular intervals on this plan represent the trees of the Champs Elysées, and it is a small proof of the clearness of the atmosphere in this almost smokeless city, that vegetation prospers so well under their shade, and that the flowering of the herbaceous plants and annuals is so little affected by them.

The plant-houses, of iron and glass, are heated by calorifères. The principal hothouse, at the western extremity of the garden (No. 46 of the plan) is about 100 feet long by 25 in breadth, enlarged in the centre to about 50 feet by a kind of transept, and is the work of M. Izambart, of Paris. It is chiefly filled with Palms, Cycadeæ, Aroideæ, and other hothouse plants in pots, only useful for their foliage, but contains also some collections of flowering specimens, amongst which the most important are the Orchideæ sent up every week from M. Pescatore's rich stores at his Château de la Celle St. Cloud. He had a very fine tuft of Sobralia two or three weeks back, and a Saccolabium, several Stanhopeas, &c., are now in good flower, although not of the age and size, nor showing the number of spikes

of our prime exhibition specimens. The Gloxinias from Messrs. Gontier's, of Montrouge, and from M. de Talleyrand's garden at Verneuil, are also now making a good show, and M. Mathieu fils, of Paris, has a well flowered Bugainvillæa trained as a small standard.

A second stove (No. 26 of the plan), about 60 feet by 24, constructed by Madame Lefèvre, is occupied chiefly by an elegantly-shaped aquarium, formed of the *chaux hydraulique* of St. Quentin. It is filled almost exclusively by Van Houtte, of Ghent. The Victoria in the centre is young and has not yet flowered; the blue, red, and white Nymphæas are but just coming out, and we cannot yet judge fairly of their merits; but, generally speaking, their vegetation is not so vigorous as could be wished, owing possibly to the quality of the water. The commoner aquatics, such as Pontederia crassipes, and Pistia, are however very flourishing. Some good Sarracenias and a fine Dionæa, showing the remains of several flower-stalks, are now fading off. Outside the basin are Van Houtte's stove plants, amongst which the most conspicuous at present is the Aphelandra Leopoldi.

The two other plant-houses (No. 21, 75 feet by 24, constructed by M. Herbeaumont, of Charonne, near Paris, and No. 32, 50 feet by 30, built by M. Léauté, of Paris) are not heated, but serve to protect such greenhouse plants as would suffer even now from exposure under the tents. One wing was, ten days since, very brilliant with a collection of Cape Ixias and Gladioli in full flower and in considerable variety; they are now replaced by succulent plants, some of which are of a good size and well grown. The remainder of these greenhouse plants call for little remark, excepting the collection of above 30 pots of European Orchideæ exhibited by M. le Docteur Boisduval, who has met with great success in overcoming the difficulties usually experienced in preserving these interesting plants through a number of years in a state of cultivation. They comprise most of the common species of Orchis and Ophrys, two pots of Serapias, several Epipactis, and three pans filled, the one with above a dozen plants of Liparis Loeseli, in full flower a fortnight or three weeks since; the two others, respectively, with as many of Herminium monorchis and Goodyera repens, now in flower. All are in full vigour, after having been thus kept in pans for several years.

The show specimens of greenhouse and other flowering specimens in pots are chiefly collected in seven circular or oblong beds, of which three (Nos. 28, 29, and 48) are sheltered by elegant tents supported on high bamboo-pointed poles, and open at the sides, two (Nos. 50 and 51) by structures in imitation of bamboo, called Indian pavilions, and two smaller ones (Nos. 30 and 31) by mere awnings. In each of them a Palm, a Dracæna, or a tuft of greenhouse shrubs, forms a raised green centre, showing off to advantage the colours of the flowering specimens arranged round them. Of these seven beds the large oblong one (No. 48) was last month very brilliant. The greater part was occupied by a mass of rich coloured Azaleas, gradually passing off, as it were, into the Cape Heaths, which occupied the lower end. The whole had the appearance of a fiery bed, which attracted the eye from any point of the garden where it could be seen. As the Azaleas withered they were replaced by Pelargoniums, which have now again given way to incipient dwarf Dahlias, too young as yet to form any opinion as to their merits. The Heaths were none of them large plants, but looked exceedingly well when closely pressed by the Azaleas. They have now dwindled down to a few small specimens.

Under the other tents, Pelargoniums and Petunias occupy the chief space. Two uncovered beds (Nos. 27 and 39) are also devoted exclusively to Pelargoniums, and many of them good, especially the fancy sorts. The plants are not so large nor so regularly and formally trained as most of our show specimens, but with less of stiffness and a somewhat freer admission of green foliage, their best plants have a more pleasing effect than ours. The large bed (No. 27) is now exclusively occupied by a fancy kind exhibited by M. Alphonse Dufoy, of Paris, under the name of Irma, and No. 39 by M. Thenier's scarlet Triomphe de Paris.

The Petunias are amongst the best of the articles exhibited. Last month there were already several distinguished for the enormous size of the flowers, and at present there is a very great variety among the different collections: that of M. Picquenot of Levallois-Clichy, near Paris, under the tent No. 29, is perhaps the most remarkable for the elegance and number of varieties, amongst which we especially noticed a pink one with a green eye, called Marquise de la Ferté, and the Aurora and other mottled varieties. Some in this and other collections, with the corolla almost entirely of a leafy green, are more curious than handsome. There are also several with more or less double flowers.

Amongst the miscellaneous greenhouse plants in these covered beds we observed, a fortnight since, two Bignonia jasminoides, in specimens 1½ foot high, covered with their delicately tinted flowers. Lysimachia Leschenaulti is a rather pretty plant, looking at first something like a Lopezia, which I do not recollect in our gardens.

The remaining open round or kidney-shaped beds are occupied by low evergreen or flowering shrubs, herbaceous plants, or annuals; the green shrubs in most cases forming the centre, round which the flowering specimens are arranged in concentric rings or borders with a very pretty effect. Tall Delphiniums, with perhaps too great a preponderance of white, such as Chrysanthemum frutescens, Iberis of various sorts, were conspicuous last month; we now see abundance of Pelargoniums and Hydrangeas, and some very showy rings or borders of Campanula carpatica. Two beds (Nos. 24 and 36) are exclusively occupied by Hydrangeas (here called Hortensias), but all more or less pink; for I have not observed any of the bluish tint in or near Paris. One bed (No. 34) is devoted to the annuals supplied by Madame Havard-Beauvieux, of Paris; and another, a larger circular one (No. 35), to a large and varied collection of flowering annuals and perennials from Vilmorin-Andrieux, very prettily arranged—the larger ones in the centre, and the lower sorts in concentric circles round the borders. Viscarias, both pink and white Leptosiphons, in considerable variety with many others, have been very full of flower, and we particularly noticed as new to gardeners the Nycterinia selaginoides forming dwarf masses covered with the prettiest little starlike flowers, and a ring of a most elegant dwarf feathery Aira dividing the lower flowers round the border.

Although there are many Roses in the different beds and shrubberies, we observed none of the finer kinds, which are only exhibited as cut flowers in the Pavillon Chinois. Along the north-west screen (Nos. 43, 44, and 45 of the plan) a long row of small pink Roses (the name of which I omitted to notice) trained as half standards about 3 feet high, and covered with flowers, had a very pretty effect, which, however, is not so good now that they are replaced by a similar row of the white Aimée Vibert Rose.

There are several collections of Coniferæ, mostly young and vigorous plants in pots. A few larger specimens, as well as a few greenhouse trees or large plants, are scattered about in tubs or planted in the ground.—Palms, Phormium tenax, Abies Pinsapo, a tall Araucaria (or Eutassa) Cunninghami, from the Jardin des Plantes, Cunninghamia sinensis, etc.; and an Agave coming into flower has been sent from Algeria. Unfortunately the growth of the flowering stem having continued whilst confined in its package, it has acquired a twist which much spoils its appearance, but it will still form a great object of attraction to the Parisian public.

There are many Ferns, for the culture of that tribe of plants appears to be coming as much into fashion here as with us, and deservedly so, for nothing can be more elegant when any taste is shown in planting them, so as to display their graceful forms. Some of the specimens in the rockworks, or as single tufts, have here a very good effect. We also particularly noticed the hardy Ferns, exhibited chiefly by M. Pelé fils, the specimens neatly separated and imbedded, as it were, in Moss. Moss, indeed, in the out-door department, and Lycopodiums (Selaginellas) in the hothouses, take a very conspicuous and useful share in the tasteful arrangement of the different exhibitions, hiding whatever might be unsightly, and forming the best possible ground for showy flowers.

Six long parallel beds or borders (Nos. 15 to 20 of the plan) are planted with fruit trees as specimens of grafting, pruning, and training, for the estimation of the merits of which we must await the result of the scientific investigations of the jury. The vegetables, the fruits, and cut flowers in the Pavillon Chinois, and the contents of the Pavilion of Horticultural Industry will form the subject of a future communication. *Paris, July* 16.

The contents of the Pavillon Chinois, and Pavillon de l'Industrie Horticole, must still remain to be described.

GRAFTED RHODODENDRONS.

The advocates of grafted Rhododendrons have laid great stress upon the profusion of flower afforded by their favourites in comparison with self-rooted plants. I was not prepared to contest this advantage; analogy warrants it, and my own experience was too limited to justify me in contesting the assertion. It is true that my limited experience was most unfavourable. Of all the plants of grafted Rhododendrons which I possess or ever did possess (for several have died), one and one only has flowered. It is a plant of R. arboreum, of which I possess the original, and it was grafted 18 or 20 years ago, in hopes that it would flower sooner and more freely than its parent stock. This expectation has been altogether disappointed. It has rarely produced a few flowers, whilst its parent in the same house with the same treatment flowers profusely. But the assertion of profuse flowering was more especially directed to hybrids of recent origin; and this year has afforded me an opportunity of testing its correctness; not in nursery gardens, where the treatment may be peculiar, but in private collections, where the plants have been subjected to the treatment they must ordinarily receive.

My own grafted plants are few, eight or ten at most; they are in full vigour, and have had the advantage of being transplanted annually in two successive years. The amount of flower produced by them was three heads, and three only; two on a plant of Victoria; one on a plant of atrosanguineum. The remaining six produced no flowers. The plants are about 3 feet in diameter, some larger. Self-rooted plants of the same dimensions, planted at the same time, and subjected to the same treatment, have all flowered except R. caucasicum; always, I believe, a shy flowerer.

Surprised at these facts, I visited a much larger collection of grafted plants in my own neighbourhood somewhat larger and older, and very favourably circumstanced for flower. They were planted in long narrow borders, and I examined the first 36 plants. Of these two, and two only, had flower-buds, and each of these but few. Self-rooted plants of commoner kinds in the adjacent borders were flowering freely.

It has been a remarkably favourable season for Rhododendrons, my own have never flowered so freely. I was surprised and disappointed at the failure of my grafted plants. At this present time, when all are growing luxuriantly, the grafted plants may be distinguished at once by the pale and sickly hue of their leaves; not deficient, it is true, in size, but utterly deficient in colour and appearance of vigour. Is it the want of chlorophyll which prevents their flowering? Dark green healthy foliage is generally the precursor of good flower, and pale and sickly foliage the result of excessive flowering, and the precursor of deficient bloom. My observations may be unpalateable, but I can only record facts as I find them, and I have no right to suppose that I have lighted upon exceptional cases. *J. R.*

Home Correspondence.

How to Cut Hedges.—Almost all the Thorn hedges one sees are clipped square, *i. e.*, the top is made flat and the sides perpendicular, the object apparently being to make them as like a wall as possible. An observation I heard made lately seems to have a great deal of truth in it, viz., that this system has a great tendency to make the hedge grow thin below, and that it is a much better way to keep it widest at the base and let it gradually taper to a point at the top. I have certainly seen hedges managed in this way present a beautifully close surface, which I attribute to the plan of allowing a much greater number of shoots to reach the outside. Hedges kept square are very apt, when old, to get "blanky," and grow bare near the ground, even though the top may be quite thick and flourishing. In this case there is no remedy but cutting down, always a disagreeable necessity, for then all shelter is gone at once, whereas this would very seldom be necessary if the hedge was kept in a pyramidal shape, for then there would always be plenty of shoots close to the ground equally young and growing as those at the top. *A Northern.* [This is excellent advice, but we are concerned to hear that our north-country friends stand in need of it.]

Protecting Fruit Trees from Frost in Spring is a thing to which I have paid considerable attention. My father, who for nearly 40 years had the care of an excellent Peach wall, never protected, and always had a good crop when the greatest sticklers for protecting had. I have tried both ways in different places, and I am yet at a loss to know which is best. In a situation in which I lived 10 years, I always protected with old tarred fishing nets, fastening them under the wall coping, and then to the bottom, as if to protect Cherries from birds, and forked sticks, about 8 inches in length, propped them out from the wall; but the best crop and finest was always from a part of the wall where the foundation had given way, causing it to lean south, with the coping projecting 4 inches, which cleared the trees of rain, and, consequently, kept them always dry or nearly so. I am, therefore, most in favour of coping-boards, about a foot in width, and projecting from the wall top so as to throw rain or strong dews off the blossom, and if matting or canvas is to be employed it can be readily done by fastening wire rods under the boards, and curtain rings fastened to the nets or canvas will allow the covering to be easily drawn aside during fine days, and the whole should be removed when the season is sufficiently advanced to render such coverings unnecessary. *W. H.*

Wasps.—I have often wished to ask your readers whether they have derived any benefit from having given a penny apiece for Queen wasps, and Dr. Lisle's remarks remind me of it. Many have I know followed this plan for years. If I remember rightly the number killed at Mr. Strutt's, at Belper, in Derbyshire, was enormous, as mentioned in your Paper some years since. It seems a paradox to say that killing thousands of Queen wasps does not at all diminish them, but I have no doubt it is true. I live close to some gardens where they have been killed for many years, and they are quite as plentiful as they ever were. Some years we have scarcely been able to see a wasp all summer through, and I have particularly remarked that the next has produced them in profusion. Any entomologist who knows his trade might make large wages by wasps in spring at 1*d.* each. I have tried it to see, and could easily make 5*s.* per fine day in almost any locality—often much more. Gentlemen's gardens particularly attract wasps in spring, from the abundance of Laurels, &c., and they come long distances to them. But I will not trouble you with more. I will only end as I began by expressing my doubts whether any one can say they have perceived any diminution in consequence of the wholesale destruction of Queen wasps at their gardens, and begging all who have tried it to say. *J.*

German Yeast.—I observe in the evidence of Dr. Normandy, before the Committee on the Adulteration of Food, that the use of German yeast is supposed to be the cause "of a peculiar disorder." Owing to the difficulty, in the country especially, of obtaining brewers' yeast, and the bitterness it often imparts to home-made bread, the use of German yeast has become general, notwithstanding its high price, which is 1*s.* 4*d.* per lb.; and as it does not keep above a few days, I have to send for it twice a week, so that it is a tax of some moment in one's housekeeping. Surely, the nature of the substance in question may be ascertained by analysis; how is it, then, that the profits on its sale are entirely in the hands of foreigners? for I am told that it is all manufactured on the continent. Perhaps some one of your readers will take in hand this important subject; and if he cannot altogether discover the exact composition of German yeast, he may ascertain what is the poisonous matter (if any) which it contains. I should be glad also to know how to remove the bitterness of brewers' yeast, which also (so my housekeepers have averred) is less favourable to the lightness of the bread than German, and how bakers, who use their own yeast, make it. As respects the adulteration of food in general, it is high time that Government inspectors should, as is done in weights and measures, visit periodically the shops of provision-dealers of every description, and in addition to a punishment by fine, &c., publish the name of every delinquent. No doubt the baneful influence of the tradesmen on borough members, and through them on Government, will be brought to bear against such a measure (and the licensed victuallers know well what can be done in that way); but let us hope for some check on such wholesale poisoning. *W. B.* [It appears from a letter in the *Times* that Dr. Normandy's evidence was misreported, and that he did not attribute to German yeast the production of a "peculiar disease," whatever that might mean. What he does appear to have said was, that he was uninformed on the subject. According to Pereira, this substance is merely ordinary yeast deprived of its water by filtration and subsidence. If so, there is no apparent reason why it should produce illness more than other yeast, unless it becomes putrid, in which state it would doubtless be unfit for use unless the high temperature to which bread is exposed in baking should destroy its noxious quality. The most ready means of removing the bitterness of brewers' yeast is by repeatedly washing it. As to adulteration of food, no doubt there is enough of that; but there is no lack of exaggeration also.]

Black Italian Poplars.—I had not failed to observe your notice of my query some months ago, but the surprise you expressed at learning that I considered these trees profitable induced an unwillingness to reply until I had well ascertained some facts. The only uses to which I believe the wood is applied in this neighbourhood are roofs and floors for cottages and outbuildings, and the repairs of bottoms of cart bodies and wheelbarrows, but for these purposes it meets a ready sale at 1*s.* per foot. Of two trees which were planted in 1821, and blown down in 1853 on a farm of mine in the south-west of Suffolk, one contained 128, the other 57 cubic feet, and in this immediate neighbourhood 336 trees planted at intervals in the years 1819 to 1822 were sold in the spring of 1854 by auction, and fetched 124*l.* 15*s.* The area of the ground in which they grew was $4\frac{1}{16}$ acres, and whilst the trees stood the pasturage of the land was let for about 5*s.* per acre. *Diss.*

Gardeners' Benevolent Institution.—I think your correspondents are labouring under a mistake in the observations they have made respecting this most excellent institution. In my opinion the election of pensioners must be left to the general body of its subscribers, irrespective of being bound or tied down to vote for this or that man. The privilege of voting should be freely exercised, the more free the better for the institution; if your correspondent's ideas were fully carried out, the institution in a very short period would become a mere benefit or annuity society—a state of things never contemplated by its founders. Are your correspondents aware that the time will soon arrive when many of the older subscribers will become entitled, according to rule 6, to be placed upon the funds, without any election taking place? and there is much reason to fear that upon every notice from the committee of an election of pensioners to fill up vacancies, a sufficient number of these old subscribers thus qualified will present themselves, and so prevent an election altogether. I hope that the committee have well considered the probable effect of this rule upon future prospects; in my opinion, if fully carried out, it will in a manner swamp the institution, by preventing the general body of subscribers from freely exercising their privilege of voting at all elections, which I again assert must be preserved to them inviolate. I do not intend to defend Blair's election; indeed I regret that a man who never subscribed a guinea to the institution should so easily have ridden rough-shod over so many deserving men; at the same time such a case as Blair's is exceptional, and may occasionally, but very rarely occur, for there were peculiar circumstances attending his election; for among gardeners, amateurs, and horticulturists, Blair's name is a "household word," the beautiful Rose raised by him "a gem among gems," having made many friends for him long before the Gardeners' Benevolent Institution was in existence, and I am informed that many such became subscribers to be enabled to vote for him. *One who has looked into Rule 6.*—I have witnessed with regret the results of the last election of pensioners to this institution, and like your correspondents who have written on the subject, I cannot help thinking that an undue amount of influence is exercised in the election of pensioners, which may, if not speedily corrected, lead to unpleasant consequences. It is distressing to think that "favouritism" should have penetrated so far as the Gardeners' Benevolent Institution. I should be glad if you could inform subscribers to the charity in whose hands this influence is vested, for unless elections be more fairly conducted, I have good reason to believe that they will give rise to strong and general dissatisfaction, and the benevolent intentions of the institution be marred and defeated by the exercise of a system as utterly opposed to the principles of such a charity as it is contrary to all fairness and common sense. *J. T. K., Croydon, July* 25.

Diseased Onions.—With respect to your suggestion of securing seed from some of the diseased Onions, a sample of which I sent you, and distributing it to such persons as might be willing to try whether the crop will fail equally in other districts, I beg to inform you that such is the destructive nature of the disease that not one Onion was left in less than a fortnight from the time I sent you the specimens. When they arrive at that stage of growth they fall to the ground like weeds cut with the hoe, and wither away. Next season I purpose to grow some in pots, using of course the soil in which they have hitherto failed, and place the pots in various positions and situations, and should the disease again make its appearance, I will not fail to send you a pot of them. *D. Sinclair, Campsall Hall, Doncaster.*

Foreign Correspondence.

Leaves from my Chinese Note-Book, No. X.—*Effects of Rebellion on China and its Productions.*—On returning to Shanghae a few days ago I found that the rebel band who had held the city so long had been destroyed or dispersed, and the Imperial flags were hoisted once more on the ramparts. But what a scene of desolation was now presented to my view! When the rebels evacuated the city, the *brave* Imperialists entered it and immediately set it on fire in various places. The evening on which this took place was perfectly calm, and the scene must have been one of the grandest and at the same time one of the most painful ever beheld. The fire was first seen running along the ramparts and destroying tent after tent—these having been occupied only a few hours before by the insurgents. Then the city was observed to have been set fire to in several places, and owing to the construction of the houses (they are built chiefly with Pine and bricks), the fire spread with fearful rapidity. The whole city, about three miles in circumference, appeared to be in flames—guilty and innocent were perishing together, thousands were rendered houseless and driven from their homes, and where to go they knew not. In the midst of all this terror and confusion the Imperial soldiers were plundering what had been left by the rebels, which I believe was not very much, and hunting down the unfortunate, in order to cut their heads off and claim the promised reward. Some of the latter, as a last resource, hid themselves in coffins, hoping thus to escape their ruthless pursuers. Many of them were discovered and slain, and then the soldiers used this as a pretence for breaking open the coffins of the dead in order to get the money or gold and silver ornaments which are often deposited with the bodies after death. Such are the fearful accompaniments of a rebellion in a half-civilised country. But these details are sickening, and I shall leave them and pass on to other matters. When I arrived here a few days since I found fully one-third of this ancient city in ruins. The poor inhabitants were wandering about looking out for the spots where their dwellings formerly stood, and in many instances marking their boundaries with a few stones or bricks. Most of them seemed completely heart-broken and paralysed, and were taking no steps to rebuild their former homes. With all the industry and perseverance for which the Chinese are remarkable it will be some years before the old city is rebuilt. The gardens and nurseries in the city and suburbs have necessarily suffered severely. It is quite melancholy to look into many of them. One

just outside the north gate, which furnished me with some of my finest plants when I was collecting for the Horticultural Society of London, is completely destroyed. A fine Glycine sinensis, which formerly covered a large trellis, is now half-buried in ruins, but is still putting forth its long racemes of blue flowers half-covered with the broken tiles and bricks, and tells in mournful accents its tale of peaceful times; a noble tree of the Carnation-flowered Peach which in former years used to be loaded with rose, white, and striped blossoms, and admired by all who saw it, has been cut down for firewood, and the stump alone remains to tell where it grew. Hundreds of pot plants are huddled together, broken, and destroyed. The little house where the gardeners used to live is levelled with the ground, and the old lady, the proprietor whom I have known for some years, and who managed the concern after her husband's death, is gone—no one knows where. In the city many places are in the same condition. A great portion of the celebrated tea gardens is destroyed. Here there was one little garden situated in front of a gentleman's house and surrounded with high walls. In addition to numerous plants in pots, it contained two pretty specimens of Sophora japonica pendula, grafted high, as we see the Weeping Ash in England, and presenting an appearance not unlike it in the distance. The house and high walls are in ruins, and the trees, which have somehow escaped, can now be seen a long way off, budding and becoming green amidst this scene of desolation. The face of the country for some miles from the city walls is also entirely changed. Formerly it had a rich appearance, and was studded all over with clumps of trees. All have been cut down for firewood for the Imperial army. Clumps of Cryptomeria japonica, Juniperus sphærica, and Bamboos have entirely disappeared. The celebrated Peach gardens near the south and west gates of the city, which at this time of year (April) used to be one sheet of bloom, have now nothing remaining except the stumps of the trees. What I regret as much as anything are some noble specimens of Salisburia adiantifolia—the "Ging-ko" of the Japanese. This is apparently indigenous to this part of China, and attains to a very large size; indeed, it is by far the largest tree in the district. Its fruit, which at first sight has somewhat the appearance of the Almond, is much esteemed by the Chinese, and consequently abundant in the markets. Such are some of the effects of rebellion in a half civilised country like China. The picture which I have endeavoured to paint applies, unfortunately, to many other parts of the country besides Shanghae. Hundreds of towns and villages are in the same state; their inhabitants are driven from their homes by fire and sword, the innocent in many instances perish with the guilty, and even women and children are not spared. One party is just as bad as the other, and the "tender mercies" of both "are cruel." Amongst foreigners residing in this country, enthusiasm has generally given way to common sense, and they have now no hopes of the Christian character of the Canton or Shanghae rebellion; indeed there has even been strong proof that thieves or pirates would be a much more appropriate name to apply to them than the sacred one of Christian. Let us hope for better things as regards the Nanking insurgents and their leader Tai-ping-wang, when we know them as intimately as we have known their countrymen at Shanghae and Canton. Although the picture which I have given of some parts of China is a melancholy one, it must not be supposed to represent the general condition of the empire. China is a large country, and those parts disturbed by rebellion bear but a small proportion to the remainder, which is perfectly undisturbed. Indeed, even a mile or two away from a place in the hands of the rebels we find the country quiet and the husbandman engaged in cultivating his land. Thus it is that notwithstanding all these disturbances we have no lack of tea, silk, and the other articles which form the bulk of our exports. *R. F.*

Societies.

CALEDONIAN HORTICULTURAL.—This was an extra Summer Competition, at which premiums were awarded as follows, viz.:—1st, to Mr. Stirling, for Alstrœmeria peregrina; 2d, to Mr. Blair, gr. to G. C. Arbuthnot, Esq., for Gloxinia albo-sanguinea. Cape Heaths: 1st, Mr. Themson, gr. to Mrs. D. C. Durham, for Erica cubica major, ventricosa hirsuta rosea, and densa carnea. Pelargoniums: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for Gulielme and a seedling named Stella; 2d, Mr. Forrest, gr. to W. Anderson, Esq., for Optimum and Forget-me-Not; and 3d, Mr. Cameron, gr. to S. Hay, Esq., for Magnet and Forget-me-Not. Pelargoniums in 6-inch pots: 1st, Mr. Henderson, Cargilfield, for Pretty Polly, Conspicuum, Little Nell, and Stella; 2d, Mr. Forrest, for Conspicuum, Magnificent, Machanna, and Rowena. Fancy Pelargoniums: 1st, Mr. Forrest, for Queen of Fancies and Princess Marie; 2d, Mr. Stewart, gr. to the Marquess of Dalhousie for Queen Victoria and Decora; and 3d, Mr. Cameron, for Fairy Queen and Lady Downes. Fancy Pelargoniums in 6-inch pots: 1st, Mr. Henderson, for Erubescens, Midia, Lady Alice Peel, and Celestial; 2d, Mr. Cameron, for Princess Marie, Perfection, Decora, and Queen of Fairies; and 3d, Mr. Forrest, for Celestial, Carlotta Grisi, Ocean Queen, and Othello. Fuchsias: 1st, Mr. Walker, gr. to J. Mood, Esq., for Banks's Glory and Queen of Hanover; 2d, Mr. Henderson, for Omega and Queen of Hanover; and 3d, Mr. Crombie, gr. to C. H. C. Inglis, Esq. Roses: 1st, Mr. Wemyss, for Madame Zoutman, Sydonie, William Griffiths, Aspasia, Géant des Batailles, Adam, Cloth of Gold, Kléber, Napoleon, Elize Sauvage, Juno, and Madame Audot; 2d, Mr. Reid, for Géant des Batailles, Baronne Prevost, Morice, Duchess of Sutherland, Charles Duval, Devoniensis, Blairi, Lanei, Madame Zoutman, Mogador, Souvenir de Malmaison, and Princess de Lamballe. Phloxes: 1st, Mr. Smith, gr. to Mrs. Dodd, for Antagonist, Brown's No. 2, and Chamouni; 2d, Mr. Kerr, gr. to R. Brown, Esq., for Brown's No. 2, Chamouni, and a seedling named Alma. The Silver Medal was awarded to Mr. Pender, of Moredun, for the best collection of fruit. The prize of one guinea, offered by G. Patton, Esq., to cottagers, for the best three Roses, was gained by Mr. Forgie, Newbattle, with Géant des Batailles, Baronne Prevost, and Purple Boursault. From Messrs. Dicksons & Co., came Clerodendron Kæmpferi, Gesnera discolor, Amaryllis marginata, Pelargoniums, Balsams, Irises, and a box of Seedling Pansies; from Messrs. P. Lawson & Son, Oxylobium arborescens, Pimelea Hendersoni, Roses, and Fuchsias; from Messrs. J. Dickson & Sons, Pentstemon Jeffreyi, Cissus discolor, Gesneras, Gloxinias, and Roses; from Messrs. E. Sang & Son, Lysimachia Leschenaulti, Cypripedium spectabile, and Iris susiana; from Messrs. Ballantyne & Sons, Roses and the newer French sorts of Fancy Pelargoniums; from Messrs. Downie & Laird, Stage and Fancy Pelargoniums, Verbenas and Antirrhinums; from Mr. Handasyde, Roses; from Mr. Stark, Irises, Pansies, and a Bouquet of Roses; from Messrs. Young & Mackay, Ranunculuses; from Messrs. Cunningham & Co., Roses; from Mr. Douglas, Fuchsia Mrs. Story (with white corolla), a semi-double Petunia and Verbena blooms; and from Mr. Stirling Linum narbonense, Lychnis quadridentata, Houstonia cærulea, &c. From the garden of S. Hay, Esq., were stage and fancy Pelargoniums; from W. Hunt, Esq., a hybrid between Sinningia and Gloxinia, partaking of the characters of both genera; from Mrs. Fraser, Androsace lanuginosa, Luzula nivea, Betonica grandiflora, and other interesting plants; from J. Mood, Esq., a fine specimen of Sempervivum villosum, and three Fuchsias; from Mr. Halliday, Scone Palace, two Queen Pines; from Mr. Laing, Dysart House, bloom of Rhododendron Maddeni; from Mr. W. Melville, Dalmeney Park, blooms of Tropæolum Scheuermanianum, and a hybrid variety raised from it; from Mr. Pender, Pentstemon Jeffreyi, and a white-fleshed Melon raised from Crimean seeds, which, though not highly flavoured, was stated to be very early; from Mr. D. Nicol, Roses; from Mr. W. Thomson, Dracophyllum gracile and Pimelea decussata; from Mr. Young, Stocks and Antirrhinums; from Mr. Macfarlane, Ranunculuses; and from Mr. Forgie, Ranunculuses. Among plants from the Society's garden were Cherry trees in pots, well furnished with ripe fruit, and a few other fruit trees from the orchard-house, erected in the garden by Lord Murray.

Notices of Books.

A Practical Treatise on Warming Buildings by Hot Water; on Ventilation, &c. &c. By Charles Hood, F.R.S. 8vo.; Whitaker, pp. 386. The third edition, greatly enlarged.

THE great value of this book is universally acknowledged; nor does the author at all overstate its importance when he says that it still "continues to be the only work which treats at large upon the principles of heating buildings by hot water; and the general application of this invention to the numerous and varied purposes to which it is applicable." Mr. Hood announces that—

"The present edition will be found to contain some considerable and useful additions. They are almost entirely of a practical character, being principally additional remarks on such parts of the subject as have either occurred to the author, or have been pointed out as requiring further explanation. The object which has been aimed at has been to render the work as clear as possible to practical men, while, at the same time, it should not be below the notice of those who might desire either to acquaint themselves with the scientific principles of the invention, or with the general bearing of the subject, on the health, the comfort, the physical development, and even the duration of life of a large portion of the human race. The effects of unwholesome air on the animal economy from imperfect ventilation, and deleterious methods of producing artificial warmth, is a subject which has excited hitherto far too little attention."

This statement we willingly endorse, but we could have wished to see the ventilation of plant houses in a prominent position. No one is more likely than the learned author of the treatise before us to work out the greatest problem now remaining to be solved in gardening; namely, *how to maintain the atmosphere inside a plant house in the same condition in all respects as that on the outside of it, temperature excepted.* But this has not engaged his attention. The ventilation of inhabited places is that to which Mr. Hood's practical conclusions mainly apply; and admirably are they stated. But glass houses, with their open laps, their innumerable chinks and cracks, their complete exposure to the weather, and the peculiar demands which the gardener should make upon the engineer, although they cannot affect the great principles of ventilation, nevertheless do render their application extremely difficult. A gardener, for example, not only requires to have vitiated (or we should rather say exhausted) air removed, but also to have such an abundance of fresh air introduced as will, without lowering temperature materially, also keep the atmosphere in a state of rapid motion. We trust to hear that Mr. Hood has applied his extensive experience to this all important subject. In the meanwhile we extract some remarks which have a direct bearing upon it, printing in italics what gardeners should most especially bear in mind:—

"Precisely the same effects as here described take place in the ventilating of rooms by openings at any height above the level of the floor. *The highest opening alone will act as the abduction tube*, and all openings below this will act as induction tubes, reducing the discharge by lowering the temperature of the air in the upper part of the room, and also by causing in it counter currents. Some modifications of this result will, however, occasionally occur, as, for instance, when the abduction tube is too small; in which case the next lowest opening will also act in carrying off the heated air. On the other hand, when the openings for the admission of cold air are too small in proportion to those for the egress of the hot air, then the current of cold air will descend through part of the hot-air tube, and the hot air will ascend through the other part of the same tube.

"These effects are frequently very sensibly felt in churches and other buildings, *where part of the ventilation is effected by means of the windows.* The cold air entering at these windows generally descends upon the heads of those who are placed near them. The effect of this entering current is to lower the temperature of the vitiated air, which parts with a portion of its heat to the fresh air entering the building, and the vitiated air being heavier than fresh air of the same temperature, it falls by its greater specific gravity, and is again breathed by the persons assembled, instead of the pure air which they would have received had the openings for the admission of the fresh air been at or near the floor of the building.

"*No plan of ventilation can be worse than that just described*, which, however is the method adopted in a very great majority of churches and other large buildings. Notwithstanding this plan has obtained such extensive adoption, it is certain that *it is opposed to every sound principle of science, and has had its rise in the most perfect ignorance of the physical laws;* and no better proof than this needs be adduced to show how very little the true principles of ventilation have been studied, and how erroneous any conclusions on this subject are likely to prove that are not based on the known laws which govern the motions of fluids.

"*In all the methods of ventilation, it is advisable to make the aggregate area of the openings that admit the fresh air, larger than the aggregate openings for the efflux of the vitiated air.* This becomes necessary notwithstanding the increase of volume which takes place in the heated and vitiated air. *If the opposite course be adopted*, and the abduction tubes be larger than the eduction, then *a counter current takes place in the hot air or ventilating tubes*, and the cold air descends through them; but by making the induction tubes numerous, and of a large total area, the velocity of the entering current is reduced, and unpleasant draughts are avoided. It is also expedient to *divide the entering current as much as possible;* for by so doing it prevents the dangerous effects of cold draughts, when the entering current is colder than the air of the room; and when it is hotter than the air of the room, it prevents the air from rising too rapidly towards the ceiling, and therefore distributes it more equally throughout the apartment. Provided the aggregate openings for the admission of cold air be not less than those for the emission of the heated air, the quantity of air which enters a room depends less upon the size or number of the openings which admit the fresh air, than upon the size of those by which the vitiated air is carried off. This will be evident when it is considered that, the room being always absolutely full of air, no more air can enter until a portion of that already in the room be removed. But as soon as a portion of the air which previously occupied the room is removed, a similar quantity of fresh air rushes in to supply its place; the quantity entering being exactly equal to that which escapes."

The Working Man's Gardener, by C. Taylor (Groombridge, 1*s.*) is a useful guide to the Cottager, written by Mr. Melville Portal's gardener. It is evidently the production of a working man, and suits perfectly all that valuable class. In farm houses it will be found peculiarly useful.

FLORICULTURE.

SCOTTISH PANSY SOCIETY'S EXHIBITION.—The eleventh annual meeting took place this year at Dalkeith, in connection with the exhibition of the Dalkeith Horticultural Society. Generally speaking the flowers were shown in excellent condition, and most varieties of any note, whether old or new, were present among them. The leading prizes were awarded as follows:—Nurserymen, best 24 distinct varieties, six competitors.—1st, Messrs. Downie & Laird, with Jubilee, Royal Standard, Countess of Strathmore, Sovereign, Fanny Kemble, Fearless, Miriam, Father Gavazzi, Miss Talbot, Flower of the Day, Lady Emilie, Nonpareil, Mary Taylor, Marchioness of Bath, Sir J. Cathcart, Beauty, St. Andrews, Sultan, Alice, Sheriff Napier, Argo, Uncle Tom's Cabin, Mrs. Campbell, Charles Cowan. Practical Gardeners and Amateurs, best 18, 12 competitors.—1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., with Duke of Perth, Lord Raglan, Royal Standard, Jubilee, Emperor, Flower of the Day, Sir C. Napier, Royal Visit, National, St. Andrews, Fearless, Yellow Climax, Monarch, Beauty, Sir J. Cathcart, Pandora, Sovereign. Practical Gardeners and Amateurs, best 12, 17 competitors.—1st, Mr. J. Hampton, jun., with Marchioness of Bath, Sir J. Cathcart, Flower of the Day, Pandora, Black Warrior, Miss Talbot, Sovereign, Uncle Tom's Cabin, Miriam, Lady

Emilie, Duke of Perth, Yellow Climax. Practical Gardeners and Amateurs, best 6, 11 competitors.—1st, Mr. J. Henderson, Cargilfield, with Miss Talbot, Fearless, Royal Visit, Monarch, Royal Standard, Sir J. Cathcart. (The bloom of Royal Standard in the above lot won the prize given for the best light ground flower in the room.) For Amateurs exclusively, who cultivate their own plants, best 6, 9 competitors.—1st, Mr. W. Young, with Flower of the Day, Robert Burns, National, Argo, St. Andrews, Yellow Climax. Classes open to all, best 12, 9 competitors—1st, Mr. Campbell, Pollock, with St. Andrews, Wonderful, Royal White, Duke of Perth, Fearless, Sir J. Cathcart, Lord J. Russell, Robert Burns, Earl of Mansfield, Argo, Miss Talbot, Royal Visit. Wonderful, in the above, was shown as a pure yellow self, and won, most deservedly, the prize for the best self in the room: indeed many were inclined to think it the finest bloom in the room also. The Sweepstakes, open to all, best 12, were won by Mr. J. Henderson, Cargilfield, with Royal Standard, Duke of Norfolk, Nonpareil, Medora, Pandora, Earl of Mansfield, Fearless, Omer Pasha, Egon, St. Andrews, Great Western. Messrs. Dickson and Co.'s Seedlings were the most successful. A yellow ground variety named Cyrus had a first class certificate, won the prize for the best yellow ground in the room, and also that for the best flower in the room. Indian Chief also was awarded a first class certificate; this is a deep purple flower of fine quality and substance, and from the same growers came Rubens, a yellow ground, with rosy purple belt and top petals, fine form and texture; this had a certificate of merit. The above were all from Messrs Dickson & Co.

Miscellaneous.

Arboral Records of Buildings.—I have frequently thought of drawing attention to an idea which has long had possession of my mind, and which, had I property adequate to the requirement, I should be inclined to carry out myself. Let me now give a notion of it. In laying out parks and planting trees, might not interesting results be produced if the trees were arranged to form models of some of our most interesting ecclesiastical buildings? Take, for example, Redcliffe Church, Bristol. Plant an Oak for each of the buttresses, and an Elm for each of the pillars, and Poplar, or some other lofty tree at the angles of the tower. It would, of course, be some years before it became very pleasing: still, for the advantage of future generations, perhaps some might be found to do it. Various shrubs and trees might be planted to fill in and carry out the design of different parts, and gravel walks would represent the aisle. Training and cutting the branches properly would be desirable, and if done judiciously might prevent formality and stiffness. *T. P., in Builder.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c. — Look over Camellias and Azaleas that were not shifted before starting into growth, and if they appear to require more pot room let this be attended to at once, in order to prevent their sustaining any check, and allow of getting them moderately rooted into the fresh soil before winter. Also attend carefully to repotting Fuchsias, Chrysanthemums, &c., for autumn flowering as they require it, and see that they are liberally supplied with water in bright weather, as if allowed to get too dry at the root the foliage will suffer. Examine the earliest cut down Cinerarias for cuttings or suckers, and get these established as quickly as possible, in order to secure strong plants for early flowering. Where suckers of the best sorts can be obtained at once, they will, with good management, form nice-sized plants in course of the autumn, and make fine plants for blooming early in spring; and these are greatly preferable to seedlings, in so far as there is no danger of growing things that will hardly be worth room while in flower. If not already done, get a good supply of Mignonette sown in pots for winter flowering, and see that the tree Violets are not being injured by red spider. Stove.—Attend to former directions as to keeping insects under. Give air freely during the day when the weather is bright and warm, and leave sufficient for the night to ensure a gentle circulation in order to prevent damp, and secure strong robust growth. Specimens in bloom of such things as are readily injured by syringing over head, should be placed where sparing them will not interfere with a liberal use of the syringe on those that require it. Use every means to maintain a moist atmosphere, and to do this the floors, &c., must be frequently sprinkled on bright days dewing the foliage with the syringe after shutting up. Be sparing of fire heat, and save where it is necessary to furnish bottom-heat, or during unseasonably cold or cloudy weather, it may almost be dispensed with for a few weeks. Where twiners are grown on the rafters attend frequently to regulating the growth of these, keeping them within reasonable limits, and see that they are not allowed to become a harbour for insects, as is too frequently the case with stove twiners. Give a liberal supply of water at the root, using manure-water wherever it can be given with safety, and if red spider attacks any of them remove the pot specimens and give the infested plants a thorough washing with the engine. See that things for winter flowering, such as Begonias, Gesneras, Euphorbias, &c., receive their fair share of attention, for if the gaiety of this house is to be maintained through the winter months, the summer flowering things must not be allowed to monopolise all the space and attention.

FLOWER GARDEN AND SHRUBBERIES.

When the plants have fairly covered the beds, the principal thing to attend to will be to preserve that symmetrical appearance over the whole of the beds which is indispensable in every regular flower-garden, to render the effect pleasing. To do this will involve frequent attention and considerable labour for some time to come, as some of the plants will incline to grow much too strongly, and will be continually encroaching upon the edgings and extending beyond their proper limits, and also getting too high and bulky for other parts of the garden. For this there will be no remedy but pegging down, and thinning out the shoots, and shortening back such as extend beyond their proper limits. In shortening back shoots, however, that may incline to overstep the edges of the beds, care should be observed to avoid the least appearance of stiffness, by thinning out the under shoots, and causing the mass to, as it were, die away at the edge. Plants of a weakly habit of growth, such as the Melindres varieties of Verbena, may require the assistance of an occasional watering with manure water, to get them to grow sufficiently freely to make a strong good bed, and, in the case of these and some other free-blooming plants, this may be used freely without any danger of inducing growth at the expense of bloom. If green-fly makes its appearance upon any of the beds, syringe the affected part at once with tobacco water and soapsuds; for if neglected, the mischief will soon spread, and be both troublesome and expensive to eradicate. Attend to plants trained on walls, keeping the young shoots neatly laid in or cut off before they become unsightly. The climbing Roses should also be gone over occasionally, stopping or cutting out strong shoots not wanted for laying in. Keep Phloxes and other herbaceous plants neatly tied to stakes, to prevent their being injured by wind, &c.; also see to tying Dahlias and Hollyhocks, and give the latter a liberal supply of manure water.

FORCING DEPARTMENT.

Pineries.—At the present season air should be given liberally to young stock in dung pits, in order to secure strong stocky growth. The plants should not, however, be exposed to drying winds by giving back and front air liberally on drying days, for this would not serve the end in view; but a moderate circulation of air should be secured at night, giving no more during the day than may be necessary to prevent the temperature getting too high. This, with careful attention to the state of the roots, keeping the bottom heat regular, the soil in a nice healthy state as to moisture, and giving a liberal supply of manure water to such as are well rooted, will be found much more conducive to strong stocky growth than exposing the plants too freely to hot drying winds, which would probably check the growth, and throw them into fruit prematurely. Use every means to afford plants swelling their fruit a thoroughly moist atmosphere, sprinkling passages, &c., frequently, and shutting up early on the afternoons of bright days, giving the plants a gentle dewing with the syringe, and saturating the atmosphere by sprinkling every available surface; also give these plenty of clear strong manure water at the root until the fruit begins to change colour, when the soil should be kept rather dry, which will improve the flavour. Vineries.—Attend to former directions as to thinning the fruit in houses intended to furnish a late supply, and see that the bunches are severely thinned, and also that the crop left is not too heavy in proportion to the strength of the Vines. Where the fruit is swelling, be careful to maintain a moist state of the atmosphere, and give every possible attention to the roots, keeping the border in a healthy state as to moisture, and if watering is found necessary, use good strong manure water. Give abundance of air where the fruit is colouring, and do not allow plants in pots to remain in the house to cause damp, which, despite every care in ventilating, is apt to settle in the berries and spoil the bloom. Where the fruit is ripe and expected to hang for some time, the atmosphere of the house should be kept as cool as possible; but a little fire heat will probably be necessary occasionally in order to keep the atmosphere dry. Use this, however, sparingly, and only when it cannot safely be dispensed with, and always in conjunction with free ventilation. Vines from which the fruit has been cut some time will probably have thoroughly ripened their wood, and should now be kept as cool and dry as possible, in order to prevent any farther attempt at growth, and induce them to go to rest, and if wet weather continues, it may be advisable to cover the border with a good coat of dry litter to throw off the rains and keep the soil cool and moderately dry. But before excluding the border from the action of the sun, be sure that the wood is well ripened, and until this is the case, take care that the foliage is not injured by insects, and endeavour to preserve every leaf until its natural period of decay. Peaches.—Expose trees freely to the air from which the fruit has been gathered, keeping the ventilators open day and night, and spare no attention which may be necessary to preserve the foliage in a clean healthy state until the young wood is well matured. Where the fruit is ripening, shading the house on the forenoons of bright days will prolong the supply, and will not injure the flavour as much as would be the case with most other fruits. Figs.—Trees swelling their second crop must be well attended to with water, giving sufficient to moisten the whole of the border thoroughly if this has been allowed to become dry while the first crop was ripening. Use the syringe freely on the foliage, shutting up early in the afternoon, and sprinkle paths, &c., frequently, in order to keep the atmosphere moist.

HARDY FRUIT AND KITCHEN GARDEN.

Where not already done, Strawberry planting should be finished at once; and if the plants are expected to bear next season, they should have been planted previous to this: but by selecting strong runners, planting carefully, and keeping them well supplied with water, they will make strong plants yet before winter. No expense should be spared in preparing the ground for this crop; and as the plants will last for several years if the soil is made deep and rich, and require but little attention in the way of manuring or digging among them, the ground should be trenched some 2 feet deep, well incorporating with the soil a very heavy dressing of manure. Select a piece of open light soil, and prepare it for Spinach by well manuring and digging deep. This crop should also be got in at once, sowing in drills in beds with wide alleys, so as to allow of gathering the crop without treading the ground. Also provide ground for winter Onions, &c. Finish planting out Broccoli and winter greens as soon as possible, for unless the autumn should prove very favourable, those planted after this time will not attain much size. Get plenty of Endive planted on rich soil; also Lettuce to maintain the succession. See to providing a good supply of Parsley for winter use; a good sized bed should be planted in some convenient situation for being protected in hard weather, choosing light dry but rich soil; and if some well established strong plants can be cut over rather closely, stirring the surface of the soil lightly, and applying a good dressing of guano or soot, they will throw up strongly and be in prime condition before winter. Attend to Celery and all recently planted crops with water in the event of the weather becoming dry.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending July 26, 1855, as observed at the Horticultural Gardens.

July.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Temperature. Of the Air. Min.	Temperature. Of the Air. Mean	Temperature. Of the Earth. 1 foot deep.	Temperature. Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 1st, 1846—therm. 92 deg.; and the lowest on the 3d, 1847—therm. 38 deg.

Notices to Correspondents.

Asparagus: *H J M.* By all means let it run to seed. If you disregard trouble you will gain something by picking off the berries. Of strong manure and salt it is greedy—very greedy. Apply the salt now at the rate of 4 lbs. to the rod; but choose wet weather or dissolve the salt in water before applying it. The manure must be applied in the winter, unless you can give it in a liquid state, in which case this is the best time.

Gardeners' Advertisements: *J R T.* Critics should be careful not to misrepresent. If you will look again, you will see that the advertiser does not say what you make him say. It seems to be a very properly worded advertisement.

Names of Fruits: *F H S.* Your Apple is not Pearson's Plate. It appears to be the Dutch Mignonne. The Apricot is the White Masculine.‖

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Diss.* All the sorts, that of Winfrithing included, belong to Quercus pedunculata. We do not remember having seen Q. sessiliflora in either Norfolk or Suffolk.—*J S.* It is Cassia australis.—*G G. Wells.* Holcus lanatus.—*A J W.* Undoubtedly Lilium japonicum.—*J T.* The small Scarlet Bean sold in toy-shops for beads is Abrus precatorius from the West Indies, a poison.—*Theta.* Anthyllis vulneraria.—*E K.* Either Pinguicula vulgaris or germanica. It is impossible to say which, the plant being quite rotten.—*D.* Maxillaria marginata, we presume.—*A B C.* It really is Stachys germanica. If you remove the silky hairs, you will find that the leaves are sharply serrate.—*E D B.* What you have bought for Helenium Douglasi is Monolopia californica. the Lophoclinium hirtum is Podotheca angustifolia; 3 is Alyssum linifolium; 5, Tamarix gallica; 4 is probably right, but the specimen is very bad.

Orange Trees: *Barford.* Their breaking out all over is a good sign. Cannot you put them into a little bottom-heat by plunging the pots in warm stable litter. It is evident that something has been wrong at the roots; but from your statement it would seem that the latter are recovering. There is still time enough for the wood to ripen, if the trees remain under glass. If it does not ripen you must keep the trees in the greenhouse all the winter, stopping their growth by dryness at as low a temperature as you can obtain short of frost.

Paper: *Anon.* Undoubtedly paper can be made from the raw material of rags, and there is no necessity for first producing rag. The difficulty is to afford the cost of the raw material. Rags are mere waste; raw materials are quite the contrary.

Strawberries: *Amateur.* Plant now on new ground well manured, trenched or deeply dug. British Queen and Keen's Seedling will answer your purpose best. Of the two, the former is the best flavoured. Let the rows be at least 2½ feet apart, and the plants 15 inches asunder in the rows. Nothing is gained by planting too closely.†—*E F.* Nothing is better than genuine guano, applied either in powder in wet weather or in a liquid state while the plants are making their growth. Now is a good time. If you cannot get guano, use good rotten farm-yard manure, applied round the necks of the plants without burying the leaves with it.

Misc.: *Subscriber.* The postage will be 2*d.*, and the paper must be sent within 15 days from the date of publication. It cannot after this date be sent to the same place as a book.

TURNIP SOWING, ETC.

GENUINE HALF-INCH BONES AND BONE-DUST may be had in any quantity of JARED TERRETT HUNT, Lambeth Wharf, Upper Fore Street, Lambeth, near Vauxhall Bridge. Also Superphosphate of Lime and Sulphuric Acid for dissolving Bones. J. T. H. also invites the attention of Gentlemen and Agriculturists in general to his Superior Fine Bone-Dust for dressing Lawns, Parks, &c. Delivered to any Railway in London in Sacks.

PATENT WOOL MANURE, 8*l.* 8*s.* per ton.—Application for Agencies, from persons of influence and respectability, will be received until the 31st inst.
NOTTIDGE & Co., 81, Gracechurch Street, London.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8*l.* per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5*s.* per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1⅜ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4*l.* per acre and under, and he can give reference to his employers in that and in other instances.
Watford, Herts, July 28.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.
T. TRELOAR, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

NEW INVENTION IN LAWN MOWERS, WHICH POSSESS SUPERIOR ADVANTAGES TO ANY MACHINES NOW IN USE.—In the first place, they will cut the Grass either wet or dry: secondly, by the simple adjustment of a thumb-screw, they can be made to cut Grass either long or short; and, thirdly, these machines are drawn instead of being pushed and drawn, and consequently do not require half the usual power to work them. They are made to cut any width suitable for either man or horse. They will turn in very little room and cut at the same time. They are a perfect roller for the width they cut when thrown out of gear. The improvement can be attached to old machines, consequently old machines that are now laid aside, can be brought into use at a small expense.—N.B. These Machines can be adjusted and wrought by any unskilled labourer.

Price to cut 16 inches, £6 | Do. 20 inches, £7 | Do. 24 inches, £8.

Testimonial from JOSHUA MAJOR, Esq., *Landscape Gardener, Knosthorpe.*

To Mr. GREEN, Leeds.

"SIR,—As I always appreciate public and useful improvements, I most gladly give my testimony to your highly improved Mowing Machine. The one sent for my inspection and trial (cutting a breadth of 24 inches) was drawn on flat ground with ease by one person, and although at the time of trial the lawn was wet, it was cut with the greatest nicety. So complete and simple is the invention, that amateur gentlemen and even ladies may work either the 16 or 20 inch size with ease and pleasure, providing the Grass is not too long. For extensive places I should say the largest size (24 inches) would be most suitable, for even in undulating ground two persons may work it, but in flower gardens, when beds, &c., are crowded, either of the smaller sizes would be best. I congratulate you on your very valuable and useful invention, which, in my opinion, entirely surpasses and must eventually supersede all others, for it is not only free from intricacy and easy to the workman, but extremely expeditious in its operations, and consequently must prove a great saving in the management of Grass Lawns, and a great boon to the public.—I am, Sir, your most obedient servant,

"Knosthorpe, near Leeds, July 19. JOSHUA MAJOR."

Several Machines of the old kind, in stock, will be sold at half price, viz.:—16 in., 3*l.*; 20 in., 3*l.* 5*s.*; 24 ins., 3*l.* 15*s.*

THOMAS GREEN, SOLE MANUFACTURER.
Iron and Wire Works, North Street and Briggate, Leeds.

THE HARVEST.

DRUMMOND'S IMPROVED REAPING SCYTHES continue to give every satisfaction, and the demand is yearly on the increase. They are as usual got up with every possible care, and are fitted with the very best picked blades. Price for three Scythes complete, 30*s.*; do. for six, 56*s.* Carriage paid to the principal Railway Stations throughout the kingdom. W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

*** To prevent disappointment early orders are respectfully requested.

N.B. Unknown correspondents will please accompany their orders with a remittance.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK MANUFACTURES in SLATE a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted.

Priced Lists of Plant Tubs and Boxes forwarded on application.

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR OR WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is thoroughly adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, ISAAC JAMES, Tivoli, Cheltenham.

RICHMOND & CHANDLER'S PATENT CHAFF-CUTTING MACHINE.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.
CATALOGUES GRATIS.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

HAY-MAKING MACHINES.

THE ROYAL AGRICULTURAL SOCIETY'S PRIZE MACHINES are supplied by WM. DRAY & Co., Swan Lane, Upper Thames Street, London.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

SAMUELSON'S PATENT GARDNER'S TURNIP CUTTER, which has been awarded NINE PRIZES by the Royal Agricultural Society. Samuelson's Patent Forking or Digging Machine. Samuelson's Registered Budding's Lawn Mower; Patent American and other Churns; Kase's Patent and other Liquid Manure Pumps; McCormick's American Reaper with Burgess's Patent Self-clearing Platform; Chaff Cutters; Cake Breakers; Corn Mills, &c., &c., &c.

Manufactured by B. SAMUELSON.
Successor to the late JAMES GARDNER, Britannia Works, Banbury

Some of the above may be seen at Stand No. 64, Royal Agricultural Show at Carlisle, and in the Agricultural Department, Crystal Palace, Sydenham. And may be procured by orders direct as above, or of any respectable Implement Dealers or Ironmongers in the country.

Catalogues may be had post free on application.

HAMPEN RAM SALE, 1855.

T. BEALE BROWNE, Esq., has fixed MONDAY, the 6th of August, for the Sale by Auction of about FIFTY COTSWOLD SHEARLING RAMS and Four or Five Older SHEEP. Two or three will be Let.

Mr. B. B. hopes to be favoured with a large attendance of his Friends on this occasion. Hampen is 8 miles from Cheltenham, and 2 from Andoversford. Sale at Four o'clock.

☞ Sheep from this Flock obtained Three Prizes and Two Gold Medals and One Silver at the late Exhibition at Paris.
ARTHUR ACOCK, Auctioneer.

ANERLEY POULTRY SHOW, AUGUST 28, 29, and 30.—Entries close August 6th. Prize Lists may be had on application to the Secretaries.
Anerley, Surrey. EDGAR SMALLFIELD, HENRY F. WELLS, } Hon. Secs.

YORKSHIRE AGRICULTURAL SOCIETY
GREAT SHOW, AT MALTON, 1855.

PROGRAMME.—Tuesday, July 31: Trial of Implements, Reapers, &c., admission 1*s.*—Wednesday, August 1: Trial of Implements continued; Cattle-yard open to the public, admission 2*s.* 6*d.*—Thursday, August 2: Great Show Day; Implement and Cattle-yards open at 8 o'clock A.M., admission 1*s.* each. Cheap trains on all the lines of railway. JOHN HANNAM, Secretary.
Office, Old Malton Gate, Malton.

The Agricultural Gazette.

SATURDAY, JULY 28, 1855.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, Aug. 1—Agricultural Society of England.

WE this week present our readers with a report of the successful CARLISLE MEETING.

During the last week and a half, multitudes of agricultural authorities and novices, business men and sight-seers, have been flocking to that northern city. Not to combine against a Pictish incursion or a moss-trooper's raid, of which the old fortresses thereabout (such as the Roman wall, Lancaster, Penrith, and Carlisle Castles and Naworth, the stronghold of "belted WILL HOWARD,") may remind them as they pass. Not to see how "ginghams" are manufactured, and biscuits baked—these being the more civilised employments of the inhabitants there in our days. But we have met in the border city our fellow countrymen and cultivators from beyond the Tweed, to view with them the best of England's food-producing machinery, the choicest specimens of the animals that furnish and perpetuate meat for our population, and perform great services for mankind. We have met to learn of each other, to impart both instruction and good-feeling to each other; and if on the one hand our southern mechanical wonders and fine animals in certain classes have excited the admiration and awakened the appreciation of the Cumberland and still more northern farmers, on the other hand, we have been no less gratified and advantaged by the north-men's show of noble horses and superior cattle.

The district visited by the Royal Agricultural Society this year includes the counties of Cumberland, Westmoreland, Lancaster, and the Isle of Man; so that with the mountaineers and factory people of these counties, and the cargoes of Manx islanders that have visited the show, there has been an ample contribution of company from the district itself; while at the same time there has been a large influx of agriculturists from neighbouring English counties, from the eastern and midland districts, and also thousands of keen and intelligent business men from the east and west of Scotland.

The Society has a mission to perform in the en-

lightenment of the locality in which for the season it may collect together the cream of our agricultural excellencies; and every one will admit that Cumberland presents a fine field for such improvement. From the railway, as we approached the great vortex of the week's attraction, how we admired the forward healthy plant of Turnips, while the crops in the south have been miserably eaten by the fly! But this is an advantage from the moist climate, which works with a greater power against the corn fields; and while producing rich and luxuriant pastures, soaks the arable land, rendering its drainage costly and its husbandry difficult. And when we examine into the condition of the farming, we discover no adequate means in use for counteracting these disadvantages; drainage is scantily performed, high farming in low repute, drills but little used, three bushels of corn per acre the ordinary seeding, hoeing and weeding most imperfectly attended to, threshing machines and iron field implements comparatively new. Some Cumberland gentlemen told Mr. Mechi, after his lecture at Carlisle on Saturday, that high farming, though just the thing at Tiptree, was not suited to their northerly climate; but that gentleman very judiciously begged of his large and attentive audience of farmers to try what Rape-cake and other food fertilisers can accomplish for them; to devote a little more study to the husbandry of straw manure, the cleaning of land, liquid-manuring, the employment of steam power, &c., and at least, to try (as he had done) some land in each corn field with one bushel of seed, just to find whether a thinner seeding than the lavish three bushels will not answer as well.

With a state of agriculture far behind the model management which obtains on the first-rate Netherby estate of Sir James Graham, and in some points reminding a stranger of his neighbourhood to wild fells and mountains, where cultivation is of a low order because of little extent and importance, every one will admit that much local good must arise from the spectacle of the past week. We have heard expressions of admiration from Cumberland farmers at the work and workmanship of the competing ploughs, the best of the paring implements, the more efficient reaping machines, the drills, the harrows, the cultivators, the horse-hoes, rakes, haymakers, and Turnip-thinners. We have heard expressions of wonder and approbation at the marvellous feats of threshing and dressing machines, chaff-cutters, Turnip-slicers, and the various orders of farm-yard machinery. And besides this, the appearance of the "real live steam cultivators," smoking and delving in their fields, must set many a mind speculating upon the principles involved in tillage, and the possible future now glimmering upon our national agriculture.

Concerning the general character of the Show, we may say that the cause of the Implement department being one-fifth short in number, may be explained by reference to the great distance between Carlisle and the regions where our chief makers find their customers; and the live stock, being one-fifth in excess, made up for any want of interest in the Show. The horses formed a grand exhibition by themselves; and the special classes for Scotch cattle and Cheviot sheep were everything that could be expected. Upon the whole, we may congratulate the Society upon a remarkable and most triumphant anniversary, inviting the attention of our readers to detailed reports of every portion of the proceedings.

The very heavy rains of the past week have done considerable damage already in beating down Wheat, which is as much laid wherever we have seen it or received accounts, as any Wheat crop probably that has of late years been harvested. If it is much prolonged there can be no doubt of serious injury being sustained. We hope during the next few weeks to publish full reports of harvest prospects.

The Secretary of the Manchester Society of Guardians for the Protection of Trade advises us that it is advisable to warn advertisers of Poultry and other live stock of the risk they run in attending to orders without some knowledge of those from whom they are received. He tell us that during the past week he has stopped some 40*l.* or 50*l.* worth of Cochin China fowls and other things on their way to men of known character in the neighbourhood of Manchester. People winning prizes, as some of those sending these birds had done recently at Windsor, advertise them, and are too eager to attend to orders to make the preliminary inquiries which are necessary; and, generally speaking, these advertisers are not members of Guardian Societies, often retired gentlemen, officers, and their servants, who perhaps never heard of such societies, and who therefore are the more open to the roguery of designing men.

Home Correspondence.

Sewage Manure.—The deposit from town sewage, once so highly prized, and supposed to be of great value, has suddenly fallen in the estimation of agriculturists, and is now deemed scarcely worth carting on to the land. Opinion has changed in consequence of analysis showing that a large portion of the fertilising properties runs to waste in a liquid state, and what remains as a solid is insoluble, and therefore useless as regards vegetation. Without in the slightest degree presuming to throw a doubt upon the experiments that have been tried in the laboratory, may it not be possible, amongst the variety of soils which a farmer has to cultivate, differing as they do in almost every acre, that some hidden ingredients may be ready to convert what seems worthless to the chemist into food for vegetable life? So many discoveries having taken place in the chemical world, which a few years ago were never thought of, that agriculturists need not despair of sewage deposit coming into favour. Dressing with the liquid manure of towns being so costly, and limited to a certain extent round each locality, and the solid deposit having been pronounced of little value, the best and richest manure in the country is, somehow or other, thrown away without a chance of becoming beneficial to farmers and gardeners. Of what is the dung-heap composed? It consists of the refuse of the food of animals, after having contributed to make muscle, blood, fat, &c., mixed with straw, ashes, sweepings, and with many other odds and ends. What is town refuse? A compost stronger in every respect, and better calculated to enrich the land; yet it is permitted to float away, by which millions of pounds are lost to the nation. No doubt there are difficulties in the way of saving this mine of wealth, but with the mechanical resources of the kingdom, aided by wealth lying idle (report says the money market is apoplectic), it is a reflection upon the industry and perseverance of the British subject to publish to the world his inability to make use of the best description of manure, because he cannot devise an inexpensive plan of carrying it on to the land.—Mangold Wurzel is most valuable food for pigs of all ages from March till August. In the winter it should be boiled and mixed with grains. *Falcon.*

Societies.

CARLISLE MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Account of the Yard and Field Trials of Engines, Implements, and Machinery, *July* 23.—On Thursday at noon began the trial of steam-engines, including nine portable and 10 fixed engines, and the result has been the most extraordinary ever yet known, Messrs. Tuxford and Son's portable engine having consumed a less weight of coal per horse-power per hour, than any other engine exhibited at any of the Society's Shows. It worked for 3¾ hours with 1 cwt. of coal, *i.e.*, at the rate of 3¾ lbs. of coal per horse power. And that this may be compared with the trials of last year, we just enumerate a few of the most successful results obtained at Lincoln:—Hornsby & Co., 4.55 lbs. per horse power; Ramsden's, 5.1; Clayton & Shuttleworth, 5.19; Garrett, 5.62; Tuxford & Son, 6.42, up to others which consumed 12 and 13 lbs. of coal per horse power per hour. What a saving will be effected if Messrs. Tuxford's results at Carlisle can be realised generally, any one who has calculated the cost of a horse per hour may easily determine.

The other competitors with Messrs. Tuxford, who approached the nearest to them, were (1) Messrs. Clayton, (2) Barrett, (3) Hornsby—their engines consuming respectively 4.05, 4.42, and 4.83 lbs. per hour per horse power.

The two last put upon trial were Boydell's traction engine, a most unwieldy affair, and Usher's engine attached to his steam plough; these were, however, not in competition for the prize, but to try their powers of draft. Those put into competition were divided into two classes—the portable steam engine and the fixed steam engine; for both classes prizes are offered. There were nine competitors for the portable engine class, *i.e.*, Messrs. Crosskill & Son; Ransomes & Sims; Clayton, Shuttleworth, & Co.; Garrett & Son; Tuxford & Son; Boydell & Glazier; Barrett, Exall, & Andrews; Hornsby & Son; and J. Lee, of Walsall; for fixed engines the competitors were Hornsby & Son; Clayton & Co.; Barrett & Co.; Dray & Co.; Holmes & Son; Ransomes & Sims; Gray & Co.; Tuxford & Sons; and Smith Brothers, whose place of precedence was arranged by ballot. The judges of this class were Mr. J. V. Gouch, C.E., Engineer to the Eastern Counties Railway, and Mr. W. Owen, C.E., of Rotherham, whose decisions appeared to give general satisfaction. We may mention that in Tuxford's engine the cylinder is placed in a house above the crank shaft instead of below; and the neatness and compactness of the arrangement of all the working parts, the manner in which they are sheltered from dirt, and yet most ready of access, were admired by all who inspected it. We must say, however, that we should much prefer the well-known flue boilers made by this firm for durability and farm-yard wear. Messrs. Clayton & Shuttleworth's engine obtained the 2d prize for the 8-horse engine, which consumed 4 lbs. of coal per horse-power per hour.

On Friday the engine trials were concluded, and the experiments commenced with portable threshing machines, their required motive power being tested by Amos's dynamometer, and their performance in threshing and winnowing by the state in which they gave out the grain and straw of both Wheat and Barley. These trials continued up to Wednesday at noon, and were pursued after the usual manner. A steam engine is selected to drive the whole, which this year fell to the lot of Hornsby & Son. One hundred sheaves of Wheat are first threshed, followed by an equal number of Barley sheaves, and the prize is to be awarded to the machine "that will best prepare the corn for the finishing dressing machine" in the portable machine class; and in the fixed machine class for the machine "that will best prepare the corn for market." Why this difference we know not. It leaves a wide question open, which has given rise to difficulties already. The whole, as well as all other trials of power, have been made by Mr. Amos's admirable "Testing Machines." We are very delighted to know that he has effected a great improvement in these machines during the year. No time is lost now in applying weights, as to the old lever. The new "totilisateur" applied by Mr. Amos renders the "weights" unnecessary; and every unit of power used during the experiment is recorded upon the "dials" of the apparatus, and are read off in the easiest manner. By removing the crank and fly-wheel, and substituting a pulley, the apparatus was driven by a steam engine, and in its turn drove the steam chaff-cutters. The trials were quickly despatched, and in the most satisfactory manner. Ainslie's machine for brickmaking came next before us; the bricks were well made from beginning to end. The chaff cutters were next tried by a smaller "testing machine," but much time was lost for want of another of capacity to try engines between large steam threshing machines and such smaller things as these, and the judges were idling for hours waiting for their use. We hope the Royal Agricultural Society of England will see to this before the Chelmsford meeting.

On Saturday the yard judges were busily occupied both with portable and fixed barn-works, and with numerous chaff cutters. On Monday and Tuesday the threshing and dressing machines, chaff cutters, oilcake breakers, grinding mills, Linseed crushers, Turnip slicers and pulpers, &c., occupied the attention of the judges, who decided as to quality of work performed, and of the Society's active engineer, Mr. Amos, and his coadjutor Mr. Appold, who ascertained the amount of power absorbed in the various operations.

As the details of these experiments will appear in due course in the Society's Journal, we hasten to comment upon the more interesting trials in the field. Respecting these, we have to complain of the inconvenience to exhibitors and to the public of a want of order and arrangement in the proceedings—no person knowing to a day, much less to an hour, when his implement was to be tried; and the delay attending the various changes from one class of implements to another giving rise to continual complaints, and the disappointment of the great company of spectators that wandered, sometimes in a pouring rain, in search of the right field, or waited with exceeding patience until their turn came for witnessing the particular operation they had come to see. Crowds of people assembled on the wrong days to behold the great novelty of steam cultivation; and many, after a weary Monday spent in watching minor trials, and when on their way home, learnt that the reaping machines were to work at 5 o'clock, and so had to attenuate their strength and temper some hours longer, or else lose the sight. One exhibitor remarked to us, when after 10 o'clock the implements had not started, "This is different to Lincoln, where we were at work by 7 o'clock in the morning."

The paring implements or scarifiers were tried upon a piece of heavy lea ground, and neither Coleman's nor Ransome's Biddell succeeded in their attempts to slice off a thin stratum of sward. Bentall's well-known broadsharer, however, thoroughly accomplished its purpose.

Ploughs.—Eleven "general purpose" ploughs were placed in competition upon the "light land;" although this was a field of stiff loam, covered with a long rough sward of Grass and Clover. All but one were iron ploughs, and more than half the number were swing ploughs. Very few minutes sufficed to demonstrate the great advantage of double wheels, and the necessity for long and very gradual mouldboards. Ransome, Howard, Ball, and Busby, at first made good work; soon, however, the contest became evidently a repetition of that last year, the first two makers being the close competitors. Ultimately, we believe, the general opinion of practical observers was in favour of the clean cut, evenly laid furrow slice, and sharp harrow edge made by Howard's plough. The prize ought to have been awarded to it. The dynamometer was appealed to, but gave nearly an equal evidence for each of the rival implements. Everybody admired the neatness with which the skim coulters enabled the ploughs to bury every blade of vegetation, and still "tuck" the furrow in tightly and in workmanlike style. Indeed those ploughs unfortunately without this admirable addition, seemed to work upon the principle of leaving a fair bite for sheep after the ploughing was concluded.

Cotgreave's ingenious trenching plough was put in action upon the same lea ground, and certainly buried the top soil, and brought up and spread over it a furrow of the subsoil, going altogether 12 to 15 inches deep. Its motion in an alluvial clay or lighter soil, where no stones exist to make it jump, would be much steadier and easier than it was on this occasion.

On the "heavy land" the strong ploughs of Howard, Ransome, Busby, and Ball, with their immense mouldboards, and a swing plough made by a local firm, with a short stunt mouldboard, were set to work. At 7 inches and at 12 inches depth, with four stout horses pulling, the palm was alike awarded by the judgment of bystanders to Ransome; indeed, Howard's ploughman seems to have failed to set his irons properly at first, and frequent alterations did not remedy the errors.

Reaping Machines.—We now come, in our hasty sketch of these preliminary proceedings of the meeting, to notice the trial of reaping machines. The crop to be cut was a light upstanding plot of remarkably forward Rye, having a young plant of Clover, pretty free from weeds, coming up underneath; and the universal remark was, that if the machines could reap any crop, they would be sure to succeed with this. Croskill's was tried first: cutting pretty well, and delivering admirably with its endless web cloth and projecting side arm, which directs and lays off the corn in swathe. The chief fault seemed to be, that its reel revolved too quickly, tending to break and thrash the upstanding corn; and having the horses behind, it was unable to traverse across the lands.

The next was that of J. Burns, of Mylnefield, Dundee, being a M'Cormick's machine with Lord Kinnaird's improvements. The horses precede the machine on one side, as in Hussey's; and it has a slower motion of the reel. It cut very clean, and laid the corn pretty readily and neatly for gathering.

Then came Messrs. Burgess & Key's patent platform added to M'Cormick's machine. The novelty consisted in three worms mounted transversely upon the platform, which delivered off the stuff sideways; the worms on which the ear ends of the straw fall having a larger diameter than the worm next the cutter, and so sending them off with greater velocity and impetus—this insuring a very regular lay of the swathe for binding. The machine cut exceedingly well, and was highly praised.

The next machine tried was Dray's well-known Hussey's reaper, with tipping platform and other improvements; among other additions, a balance weight has been attached to the crank-axle, giving it great freedom in its rapid revolution. It took 4 to 5 feet in width, cutting very cleanly, and delivering beautifully in separate sheaves, laid straight and ready for the binder. The tipping platform wonderfully facilitates the back delivery. Being simple and cheap it excited the general approbation of the eager and interested crowd of spectators, the business portion of the company agreeing that it seemed more like the thing wanted than any other there exhibited.

Palmer's (of Scotland) reaper has a platform in the shape of a quadrant, so that the man raking off delivers the corn on one side, instead of behind. By this form, too, the corn is not carried bodily forward, as it is in other machines having a side delivery, but, on the contrary, takes a diagonal or rather circular course, the difficulty arising from having to overcome the inertia of the weight of corn being thus avoided. The platform was fitted with a radiating system of rollers, intended to reduce the friction of the straw upon it; but the advantage of this contrivance was not at all apparent. An iron guard, fixed so as to enter the standing crop and incline it to the cutters, at the same time clearing a passage for the wheel carrying the far side of the platform, was light and efficient.

Harkes' rotary reaper excited much amusement from its original-looking figure. Having found the impossibility of steering it with the horses behind, the inventor has now put the team in front, though not two abreast, as in the case of other machines. The huge drum of cloth, with its sharp serrated circular knife below, and a ring of pegs on its upper rim for catching the corn, revolves rapidly as the horses proceed; and the corn is carried forward round the front of the drum, and delivered between it and the horses' heels—only half the diameter of the drum entering into the crop. This machine scattered many more straws than any of the others; the cut was ragged; the corn delivered in a ruffled state; and had the green Rye been ripe Wheat, a great proportion of the grain would (from the violence of the motion) have been threshed out and lost upon the ground.

Dray's machine attracted most encomium, on account of its unpretending appearance and beautiful delivery; while Burgess & Key's came next in our estimation. However, had the crop been at all laid and storm-broken, it is a question whether any of the machines would have been able to collect and deliver the corn. Inventors seem to employ their principal ingenuity in disposing of the stuff when already cut and on the platform; whereas the main difficulty is to get an unfavourably conditioned crop on to the platform at all. We were gratified to see at Lincoln a model in which the crop was bent down forwards, instead of being pulled backwards, in direct opposition to the onward movement of the machine, and hoped to see at Carlisle a matured scheme of this kind; but we have been disappointed—a good reaping machine for heavy crops is yet to be constructed.

Of the nine reapers entered for exhibition, one did not make its appearance; there was, however, a novelty in the showyard in the shape of a model invented by Mr. G. Lee Baxter, of Swinton, near Nottingham, and exhibited by Mr. W. Hall. It has a revolving disc cutter, under a sort of plough-shaped cover, which entering the crop, throws off the cut corn on each side, much as the earth is thrown aside by a double mouldboard plough.

The trial of reaping machines has been postponed until harvest, in order that a fairer crop may be obtained for testing their abilities.

Steam Cultivators.—On Tuesday the grand point of interest was the trial of the steam cultivators. A great number of spectators were assembled in the heavy-land field, but unfortunately no engine made its appearance except Boydell's, which amused as well as astonished the company by running backward and forward, over Grass or ploughed surface, along or across the lands. Many were the conjectures as to what might be expected from this huge machine, as it walked along at a smart pace, though with the clumsy feet of a megatherium.

This machine has already been described in our columns (see p. 410). The wheels carry slippers or pattens whose own weight places them so that the weight of the machine is always borne upon a flat platform, as it were, instead of the curved and narrow edge of a wheel. The advantage of this, in the case of soft and rough ground, was successfully illustrated by the hauling of a cart so furnished and heavily loaded, over difficult ground, which was done—laboriously no doubt—though without the aid of these portable rails, as they are called, it could not have been done at all. The steam engine furnished with these wheels, and exhibited by Mr. Boydell, was put in exercise and tried against a force of men pulling against it; and it was found that 30 men could stop it, so that professing to be 12 horse power it may be considered as efficient for barely half that amount—fully one half being used in its own conveyance over the ground on which it was then working. A frame containing four ploughs, mounted upon carriage wheels, and fitted with levers for lowering and raising in and out of the ground, was attached to the engine in one of its trials. The engine proceeded slowly, dragging the ploughs behind. This arrangement of ploughs for the purpose is the invention of Mr. Coleman, and answered pretty well until one of the ploughs broke short off, and the work came to a standstill. A common iron double furrow plough was next tried, but not with very marked perfection of ploughing—the trial, in fact, being merely to see whether the engine could drag ploughs behind it, as well as propel itself over the land. Gibson's digger was then drawn by the engine; but the soil and weeds clogged the rowels and scrapers, and left the ground behind in holes and heaps. The ground was certainly moist, and the day was extremely rainy; but we doubt whether the work would have been very different had the weather been fine. When drawn on the unploughed lea, the stirring forks in a great measure stripped through the soil without breaking and raising it, though they penetrate some 9 or 10 inches deep. The draught of this implement we judged to be about that of six horses; but the engine of 14-horse power could proceed with it only at the pace of about 2½ miles per hour; so that 8-horse power was absorbed in moving the engine itself. This fully showed the uselessness of such a ponderous machine for tractive purposes. The "endless railway" seemed to act very well, not clogging with the wet soil, or in any way betraying liability to derangement. The pressure of the shoes upon the ground did not appear much more injurious than the trampling of horses; and this is reasonable, when we consider that the total weight of 6½ tons rests upon four shoes at once, that is to say, upon 12 or 15 square feet of surface. We must regard this clever invention as adapted for carrying great weights over rough ground, but not able to conduct a locomotive engine with sufficient ease for it to draw field implements behind it.

Great disappointment was felt at the non-appearance of Usher's steam-plough. This invention, as is well known, consists of a number of curved ploughs set about an axis hung transversely behind a locomotive engine, and so rotating as to act like propellers, assisting the onward movement of the engine. The machine now exhibited is very different from the first that was made, having a vertical instead of a common horizontal boiler, double cylinders, different gear work, and spur wheels for communicating motion to the ploughs and to the carriage wheels; and there is a movement by which the engine itself raises or lowers the ploughs for work. It has been tested to be of 19-horse power; but the weight seems much greater than 5½ tons, as six horses were hardly worked in drawing it into the show-yard. Having got up steam, and attempting to propel itself to the field, the badness of the road occasioned a slight accident, and this, together with the unwillingness of the inventor to have the machine tried upon stiff lea ground in wet weather, has prevented the public from witnessing its performances.

As we were coming away from the trial field, impressed with the sentiment that "the steam cultivators were a failure," and soaked with rain, old Aquarius having turned on his taps as if to give Walter Scott the lie for saying the "sun shines bright on Carlisle wall," the stewards, Mr. Amos, and some few other lucky individuals, received intelligence that another steam plough had started in a field half a mile off. Making the best of our way to the light land trial field, there, sure enough, stood a portable engine in one corner, with ropes and pulleys, and a ploughing machine, all in action. The engine was that belonging to Mr. Lee, of Walsall, and the plough and tackle are the invention of Messrs. Fisker, of Stamfordham, manufactured by R. Roger, of Stockton-on-Tees. It had been tried in Perthshire, last winter, being actuated by a water-wheel; this being the first day of its trial with steam power. The whole apparatus is novel, and we may say, uncommonly promising. Instead of a heavy wire rope to drag the plough frame by main force, a light endless hemp rope, only three-eighths of an inch thick, communicates power to the plough carriage, which we may call locomotive, as it propels itself in the following manner:—a grooved wheel, set in motion by proper spur wheels from a rigger actuated by the hemp rope, winds, as it were, along a strong wire rope laid upon the ground; and the frame being thus carried slowly forward, drags ploughs or other implements after it. The hemp cord does not touch the ground, but is held up at every 40 yards distance by a "horse," or small friction pulley frame, about 3½ feet high. This cord travels at the rate of 20 miles per hour; but the speed being reduced by the wheel work upon the plough carriage, the latter travels only two miles per hour. When two ploughs are in work at once, having the draught of four horses, the strain upon the rapidly running cord will thus be less than half a horse's draught. We were informed by the exhibitor that a 4-horse engine is sufficiently powerful to work two ploughs, and that with 4 cwt. of coal it will plough 4 acres in a day, the expense for labour being only that of two men and a boy. If this be strictly the fact, we have a complete invention able to plough light land at a cost of say 3*s.* per acre. That it is not far from the truth we are sure, for we ourselves saw one plough drawn at the rate of at least two miles per hour when the engine had only 7 lbs. or 8 lbs. pressure upon the square inch, and this was an engine of 6-horse power at 40 lbs. pressure. To be sure, the land had been previously ploughed, pulverised, subjected to the trial of all sorts of drills, and been afterwards well trampled by hundreds of people, and consolidated by rain, so that the possible quantity and quality of the work could not be well ascertained. The ploughing we saw was respectably though roughly done, but there was one point really performed—the furrows were well turned. If a steam cultivator can invert the soil thoroughly and cheaply we may put up with a little imperfection in the straightness of cutting and evenness of laying. The method of anchoring the pulleys, and the arrangement of the pulleys and ropes, is very ingenious, and can hardly be explained with brevity. The anchorage consists of a plate or plough, a few feet in length, and 8 inches only in depth; this can be easily drawn forward *in* the ground without the trouble of digging holes, taking up, setting down again, &c.; and yet it presents a sufficient resistance sideways to the pull of the ropes. A wheel, pinion, and crank on each anchor is used to draw it by means of a rope towards a fixed post, when it is required to be shifted. The arrangement of the ropes about the anchored pulleys is like that of the chains in a travelling crane, the anchorage being shifted forward at intervals without altering the length of rope. The ploughs are not rigidly attached to the travelling frame, but are hung by short iron beams, which form levers, having a slight degree of play up and down. There are four ploughs—two before and two behind the carriage, pointing opposite ways, a neat lever movement lifting two out of work and dropping the other pair of ploughs in; so that the machine can plough both ways without having to turn round at the land's end.

The steam cultivator entered for exhibition by M. Alexis Dussuc has not appeared. But as far as mere ploughing is concerned, we think the above contrivance contains all the elements of success. Whether a better description of tilling instrument, actuated by ropes in this way, can be produced or not, remains to be seen; perhaps Mr. Fowler may solve the question next year at Chelmsford.

The draining engine has appeared in an improved form. Mr. Fowler has contrived an anchor having a clip movement, which causes it to open and key into the hole the more it is pulled. There are also improved blocks, in which the large curve of a heavy wheel is obtained by substituting three smaller and lighter ones. The engine is new, with new crane gearing for reducing the speed of the reels. It is of 8-horse power, and as the leverage is reduced by the wheel-work to 12 for 1, the strain upon the wire rope is that of 96 horses; and this being doubled by the pulley hung to the plough, makes the draught of the implement that of 192 horses. The holes for the anchors cost 6*d.* each digging, so that this plan would not answer for steam ploughing; but an immensely strong purchase is required by this powerful machine.

We must more shortly give the reports of other trials.

Portable Threshing Machines.—Amongst the portable threshing machine makers there seems to be a great struggle. Messrs. Clayton and Shuttleworth have lost their first place, though carrying off a silver medal. The machine for which this medal is given appears to do more than was wanted, and was, on this account, put out of competition. It professes to give a perfect dressing. For this purpose an addition has been made to the right side, by which the three necessary separations are made in the corn, head, seconds, tail. It may, we were assured, be added to the machine of last year for the sum of 15*l.* The bearings struck us as being very complicated, and not good to reach except when the machinery is at rest; nor did we think the reciprocating motion so perfect as in Hornsby's machine, that took the first prize.

Hornsby, who has so long excelled in the dressing machine department, is fairly entitled to the place he holds. The improvement in the principle is as follows:—There is a cylindrical wrought iron beater, combining strength and lightness, together with peculiar ability for fine setting. The reciprocal motion is so well contrived

that the motion of the two ends of the machine neutralise each other. We more particularly desire to notice the introduction of a Venetian lath riddle, separated by a wire between the laths—a panel screen between the chaff separator and screen board, taking out the dust from both chaff and straw—a crank working at the furthest end of the shaker raises the straw with more play, like a fork, so as to obtain the greatest shake at last—the Barley being delivered by elevators into the Barley awner on the near side of the machine, passes through the Barley awner about 4 ft. 6 in., delivering on the other side.

To Messrs. Ransomes & Sims the second prize of 10*l.* is awarded, but with what justice we will scarcely take it upon us to say. According to our opinion, the bearings are far too many, the whole affair too complicated, and the shaker decidedly defective, which from its peculiar form must necessarily draw back a considerable portion of the "earings."

The machine exhibited by Messrs. E. and J. Humphreys received a high commendation, but Messrs. Tuxford & Son's, which also was highly commended, gave us greatest satisfaction. When we say that it has only eight running bearings, all external, and readily oiled when at work, we say a great deal, since to do the same work some machines have as many as 14! many of which cannot be reached unless the wheels are at rest. All is very snug, the very elevators running withinside the frame, and although there is no decidedly reciprocating motion, the motions seem to be admirably balanced, and so that "rocking" is obviated. Perhaps the best feature of this machine is the shaker, which is lightly constructed. The jumping movement complained of some four or five years since is moderated—its advantages without its ill effects are retained. It is not the least recommendation to these exhibitors that their price, 95*l.*, is considerably beneath many.

In Messrs. Garrett & Son's machine the evils proceeding from the method usually adopted of applying to the drum-shaft the whole amount of power required by the machine are avoided. The improvement consists in the introduction of an intermediate shaft, to which the engine is attached, which shaft is supported on the frame of the machine, and carries the necessary pulleys for driving the drum and other working parts of the machine, by which means the power is applied nearer the ground, ensuring therefrom an increased steadiness in working the machine, and avoiding much of the undue wear-and-tear complained of in other machines. The running bearings are very numerous.

Messrs. Barrett & Exall exhibit a machine affording in all nine separations. The drum is wrought-iron, their own patent; the appliances for setting and regulating are especially simple and effective; the bearings are few, but the motions are not so well balanced as in either Hornsby's, Tuxford's, or Clayton & Shuttleworth's implements. The price 105*l.*

Mr. Whitehead, of Preston, shows a slight improvement on his machine of last year. It consists in a catch box to the face wheel, by which a disconnection is instantly effected between the horse power and the drum. This is a good little thresher, 4-horse power, only 44*l.* with the horse works.

Mr. Goucher, of Worksop, exhibits nothing new in the way of threshing machines, calling attention merely to the benefit derived from the employment of his own patent beater—the same as is used by Messrs. Clayton & Shuttleworth.

When we left the yard the prizes for the fixed threshing machines were not awarded; indeed, the trials were going on. [See Prize List at foot.]

Amongst the *corn dressing machines* the greatest novelty was Salmon's patent winnower and seed separator. This wonderful little implement, the invention of an American, took one of the three silver medals awarded to agricultural implements at the World's Fair, New York, and several other prizes at other places. It is introduced into England under Messrs. Dray's auspices. It will separate from Wheat, Cockle, Chess, Redroot seeds, dead kernels, Charlock, and the majority of Oats, and all other impurities. It will clean Oats, Peas, Beans, Barley, Rye. Rice, and garden seeds. It will separate Oats from Peas, Beans and corn, Clover from Timothy, Redtop from Clover, &c., and it will take Grass seeds, Clover seed, and Wheat, and separate all three seeds at one operation. It reminded us of another American machine, advertised to give out ready cooked sausages from one end and brushes at the other, having swallowed a hog in the centre! One bystander requested, with a demure face, to know whether the machine was competent to separate old from new Wheat. "Eh!" replied the ready Yankee, with a laugh, "Yes, sir; and 'maple' Peas from 'grey coats!'"

The novelty of this machine consists in the mechanical arrangement of the blast and sieve. The fan is iron—placed in an air-tight trunk at the bottom of the frame. The fan is driven by a cog wheel 2 feet in diameter, which gives the fan great velocity, sending the air up an air-tight trunk through which the grain is falling from the sieve, the dust escaping at the head of the trunk, which is partly covered by a wire sieve, when the screenings immediately fall through the mouth of the head of the trunk, free from dust and dirt, the good grain falling through the blast into a receiver at the bottom. The heavy seed are taken out without the aid of the blast. Only one sieve is used at once. The sieves are jogged by a cane and spring in front, instead of shaking sideways. There is no complication about the machine, and the power needed much smaller than that required by any other dresser. No prizes have as yet been awarded to this class, but the silver medal has been given to the exhibitor of this implement.

Mr. Nicholson exhibits a dressing machine which is highly commended. There is nothing of a novel construction noticeable about it, however, nor is there in Mr. Bunting's, which also receives commendation of the first degree. Its price, 7*l.*, is its best commendation.

Mr. Roby, of Bury St. Edmunds, exhibits in certain respects a new implement. It is for separating more particularly the broken corn from the entire grain, and giving a more even sample. This object is attained by an improved horizontal wire screen, divided into spaces, and kept clear while in motion by means of collars passing between and above the level of the wires. A simple application of this may be beneficial to maltsters, who during the present high duty on malt, will be anxious to malt nothing but the finest grain; but for the use of the farmer the extra advantage will scarcely be worth the extra expense, for the machine sells at 15*l.*

Hornsby sells one to perfect the sample that comes from his threshing machine for 11*l.* There is nothing new in it, except that it gets through an incredible quantity of work, and that its fittings and details are much more simple, nice, and effective than they ever were before.

Grinding Mills: Power Mills.—Those put upon trial in competition for the prize in this class were exhibited by Messrs. Hayes, Whitmer, & Co., Crosskill, Clayton, Shuttleworth & Co., and Turner, respectively. Messrs. Whitmer & Co.'s was first subjected to the test, but the smallness of the pulley caused it to vibrate with such rapidity that at once decided the trial. It was evident that an error had been committed in calculating the speed of the machine, and further proof being wanting in the application of a larger pulley to the testing break, which would have occupied too much time and only ended in proving its inefficiency, it was withdrawn. The machine of Mr. Hayes next followed; it is fitted with Derbyshire Peak stones, and is made to grind Barley into soft meal; this it did very satisfactorily, and being at a moderate price, 26*l.*, the judges gave it a high commendation. Clayton, Shuttleworth & Co.'s came next; it was brought to the testing machine on a truck, set down, and commenced working in a very few minutes, whereas some others occupied a long and provoking time in preparation. It is fitted with a pair of portable Derbyshire mill-stones, 2 feet 8 inches in diameter, and went through its trial admirably—almost without a vibration. The sample soft and good. The adjustment by which the degree of fineness is regulated "consists in substituting a toothed disc in lieu of a quadrant," upon a vertical spindle, which enables the alteration to be very minute; price 48*l.* We thought the judges justified in awarding it the prize. The next was Mr. Crosskill's. This is a powerful mill fitted with French mill-stones, 2 ft. 8 in. diameter, and driven at the rate of about 240 revolutions per minute; it did not work equally satisfactorily with Clayton & Co.'s, whose revolutions do not exceed 170 per minute with stones of equal size. We thought the velocity too great to act well. The whole worked well; price 55*l.* It received a commendation. Mr. Turner's was next tried. This is a combined crushing and grinding mill. "The corn first passes between a pair of smooth rollers, by which it is so thoroughly crushed that on reaching the stones a very little pressure reduces it to a fine meal." The meal was rather cooler than some of the other competitors', and it worked satisfactorily, except that the expenditure of power was rather too great for the work done. The mill was too complicated, we thought; price 25*l.*

Linseed and Corn Crushers: Power Machines.—The machines shown in competition were from the manufactories of Messrs. Turner, Stanley, Ransomes & Sims, and Phillips and Woods respectively. The trials were very satisfactory, and each mill deserves commendation, but owing to Mr. Amos's testing apparatus, the judges are enabled to decide with accuracy the comparative merits of each. Consequently Turner's received the prize, Stanley's was highly commended, Phillips and Woods commended; Ransomes & Sims did not receive a commendation, we suppose owing to its being more adapted for hand than steam power, it being much smaller, and did not do so much work as its competitors.

Cake Breakers: Power Machines.—The prize in this class is offered for breaking every variety of cake, and the breakers put into competition were those of Messrs. Crosskill, Hornsby & Son, and Garrett & Son, each machine being adapted for breaking either for cattle or sheep. They all made satisfactory work, and each received an approving award—Garrett & Sons the prize; Hornsby & Son's highly commended; Crosskill's commended.

Chaff Cutters: Power machines.—The trial of the chaff cutters excited considerable interest. The competitors in this class were Messrs. Barrett, Exall & Andrewes, Williams, Dray & Co., Richmond & Chandler, Smith & Ashby, Carson, Farnes, Cornes, Ransomes & Sims, and Garrett & Son. The work was variously, but, as a whole, well performed, the time given to the engine being a two minutes run each. We carefully noted down the reading off from the dynamometer as given by Mr. Amos, and making due allowance for clever feeding, &c., we were surprised at the results obtained, some of the engines cutting chaff of equal quality and more than double in quantity to others, with the same or even less expenditure of power; thus mechanically proving the value of the machine, and by this test, we presume, the judges decided. The prize was given to Mr. Cornes. Messrs. Dray & Co. received a high commendation, and Messrs. Barrett & Co., Messrs. Richmond & Chandler, and Messrs. Garrett & Son respectively received commendations.

Chaff Cutters, hand power.—The competitors for the prize were Messrs. Crosskill, Garrett & Son, Williams, Hill and Smith, Smith & Ashby, Richmond & Chandler, Cornes, Carson, and Ransomes & Sims. The chaff cut in this trial varied more in quality than in the power machines, and the work as a whole was not so well performed. The time given in this trial was four minutes each, and the results as given by the "testing machine" were similar to the last, the great test being the units of power required to cut 1 lb. of chaff—each equal to 1 lb. lifted 1 feet high. The highest and lowest numbers tested in the power machines being respectively 2868 against 1812, and in the hand power machines 3310 against 1284; the chaff, however, of the latter was too long to compete with the others. The prize was given to Messrs. Richmond & Chandler; Messrs. Smith & Ashley, and Cornes received high commendations, and Hill & Smith a commendation.

Bone Mills.—There being no competitor in this class except Mr. Crosskill, the prize was awarded to him for his well-known mill, which is not only capable of grinding bones but by changing the plates will grind any kind of grain.

The number of visitors to the show-yard on Wednesday appeared to be thinner than we remember to have ever seen before—the pouring rain, perhaps, tending very much to produce this paucity of attendance.

As to the general character of the Show it appears from the catalogue that the number of implements exhibited is, as might be supposed on a comparison of Carlisle with Lincoln, about one-fifth under an ordinary exhibition of the Society; but that there are abundant means of comparison supplied is obvious from the following numbers: 9 carts, 22 chaff cutters, 12 churns and cheese pressers, 17 clod crushers and rollers, 18 corn dressing machines, 23 cultivators, scarifiers, and grubbers, 14 drilling machines, 28 mills, Linseed crushers, and Bean splitters, 22 harrows and horse hoes, 8 horse rakes, 21 ploughs, 20 Turnip cutters and pulping machines, 16 reaping and mowing machines, 14 steam engines, 21 threshing machines, besides a multitude of implements otherwise classified. On many of these we shall have further remarks to make next week.

PRIZES FOR IMPLEMENTS.

Plough for general purposes, 5*l.*, Ransomes & Sims.
Plough for over 9 inches deep, 5*l.*, Ransomes & Sims.
Machine for draining tiles or pipes, 5*l.*, John Whitehead.
Cultivator, grubber, and scarifier, 5*l.*, Richard Coleman.
Drill for general purposes, 10*l.*, R. Garrett & Son.
Corn and seed drill, 10*l.*, R. Hornsby & Son.
Drill for small occupations, 5*l.*, R. Hornsby & Son.
Small-occupation seed and manure drill for flat or ridged work, 5*l.*, Holmes & Son.
Turnip drill on the flat, with manure, 5*l.*, R. Garrett & Son.
Turnip drill on the ridge, with manure, 5*l.*, R. Hornsby & Son.
Liquid manure or water drill, 10*l.*, R. & J. Reeves.
Manure distributor, 10*l.*, R. Garrett & Son.
Horse hoe on the flat, 5*l.*, R. Garrett & Son.
Horse hoe for setting out Turnips, 5*l.*, R. Garrett & Son.
Portable steam engine, not exceeding 8-horse power, applicable to threshing or other agricultural purposes, 20*l.*, Tuxford & Son.
Second ditto, 10*l.*, Clayton, Shuttleworth, & Co.
Fixed steam engine, not exceeding 8-horse power, applicable to threshing or other agricultural purposes, 20*l.*, Ransomes & Sims.
Second ditto, 10*l.*, Barrett, Exall, & Andrewes.
Portable threshing machine, not exceeding 6-horse power, for larger occupations, 10*l.*, Ransomes & Sims.
Portable threshing machine, not exceeding 8-horse power, with shaker, riddle, and winnower, that will best prepare the corn for the finishing dressing machine, to be driven by steam, 20*l.*, R. Hornsby & Son.
Grinding mill for breaking agricultural produce into meal, 5*l.*, Clayton, Shuttleworth, & Co.
Linseed and corn crusher, 5*l.*, E. R. & F. Turner.
Power chaff cutter, 5*l.*, James Cornes.
Hand chaff cutter, 3*l.*, Richmond & Chandler.
Turnip cutter, 3*l.*, B. Samuelson.
Machine to reduce roots to a pulp, 3*l.*, F. Phillips.
Oilcake breaker, 5*l.*, R. Garrett & Son.
Power bone mill, 5*l.*, A. Crosskill.
Churn, 3*l.*, Burgess & Key.

On Wednesday afternoon the cattle yards were open to the public on payment of 10*s.*, and the comparatively few spectators present in the implement department were soon, in great measure, drawn off to the more attractive cattle classes. We shall publish the prize list along with some general remarks on some of these classes this week, being forced by want of room to postpone a portion of our report till next Saturday.

The cattle and horse classes have been exceedingly well represented. The entries for short-horns were somewhat short of last year, being 98 as against 11[illegible]. They are, however, a very interesting and splendid collection of the breed. We were pleased to recognise old acquaintances amongst them—Mr. Douglas's heifer again competing with her fellows as at Lincoln, and others in the various classes did the same. Many of the individual specimens shown at our meeting could not be exceeded. Lord Berwick's bull of this year is a case in point. The Herefords are 32 as against 14 at Lincoln. The Devons as 23 against 38 at Lincoln. The other breed classes, excluding the special prize classes, as 58 against 17 at Lincoln. The Scotch classes are well supported, and some very fine Angus and Galloways were exhibited.

Class 1. Short-horns: In this class the 1st prize bull is almost a perfect cylinder, of good proportions; he possesses a deep chest, a level uniform back; chine, back, loin, and rump in fine level outline; his under parts perfect; flank deep, and thigh full; shoulder well out, and brisket good; his horns somewhat wide out, and head rather plain; quality of flesh very good.

and denoting a good proportion of lean. The 2d prize bull possesses a beautiful head and horns; fine chine, chest, and neck; capital girth, level back, deep sides, well-formed broad loin, and good hips; rather high good thighs and flank; he is an exceedingly good form, and denotes, like the preceding, a fair amount of good lean flesh. No. 7, Mr. Ambler's bull, was highly commended; he is a noble animal, having a good chest well out, head and neck finely set, good shoulder, chine and girth fair, back level. No. 14, Mr. C. Townley's bull, was highly commended; he possesses a very fine form, rather small and compact, a short neck and full chine, shoulder well out and full, flank good and thighs deep, hips rather too contracted, but stands well as much lean flesh of good quality. No. 17, Mr. Fletcher's bull, was commended; he has a good form, his forequarters heavy and fine, the ribs not sufficiently springing, his hips, rump, and loin slightly defective, legs rather short, and too much body. No. 18, Mr. Cartwell's bull, was commended; he has a beautiful head and horns, and very deep frame throughout. He has no parts particularly noticeable, but as a whole he is a noble well-made animal, and well deserves the commendation he received. There were many good animals shown in this class, but our time is too limited this week; we may notice others at a future day if we think it desirable to renew the criticism.

Class 2. Bulls calved since the 1st of July 1853, and more than 1 year old. The first prize was awarded to Mr. Towneley's bull. This was the prize yearling bull calf of last year; he is greatly improved, possessing a beautiful long frame, fine horns and head, rather long, fine eye and muzzle, colour good, well proportioned symmetrical frame, level fat back, capital loin and deep thighs, good twist and flanks, full breast, and shoulders well out. The model of a good animal throughout of fine quality. The second prize was awarded to Mr. T. W. Rawkes' bull. He has a fine cylindrical form, well proportioned, a very level even back, and he is of very good quality; perhaps his rump is too short and tail too high. No. 32, Mr. Towneley's bull, was highly commended. He has a beautifully compact frame, and stands well, good arms, short neck, deep chest, level back, hips rather too close, rump fair, tail stands well, thighs fair. No. 33, Mr. T. Fowler's bull, was commended. He is a well-made animal, deep in frame, with wide outstanding hips, his chest is full, and arms well standing out, ribs not sufficiently up to hip, leaves too much body. A very good competition; but one or two inferior animals.

Class 3. Bull calf, above 6 and under 12 months old. The prize was awarded to No. 45. This is a very prettily made up animal, of good length and proportions, but not equal to some shown by Mr. Towneley at other times. No. 37, Viscount Hill's bull-calf, was commended; a compact little fellow—hips rather awkwardly prominent. No. 44, Mr. R. Jefferson's bull-calf. This is a beautiful calf, well formed and in good proportion—ribs not out enough. This was a good and well filled class.

Class 4. Cows in milk or in calf. The first prize was awarded to No. 55. This cow has a symmetrical form of great beauty and proportions, deep frame, fine prominent chest, head erect, not large, neck thinnish, level back, loin very good, superbly so, teats large and fat, thighs little defective; a first-rate animal, and equal to any in the yard. The second prize was awarded to No. 52. This is the cow which in the heifer class took the first prize at Lincoln, and was the theme of general admiration. She has the same deep and beautifully formed frame, and is much improved, though according to the opinion of the judges she has not progressed so fast as her more fortunate competitor. We think the decision correct; she is not in general form and feature so fine an animal, but her rotundity or broad cylindrical frame will ever be remembered by those who have viewed her; such a chine, and back, and expansion of rib are seldom seen, but her legs are too short, and detract from her nobility of appearance, otherwise she is nearly perfect. No. 56, Mr. John Booth's cow, was highly commended. This cow has a remarkably good frame, back broad, and level neck; thin and narrow at shoulder, ribs well set and springing. No. 49, Mr. Stratton's cow, was commended; she is a beautiful animal; head and horns fine; chine and chest all you can desire; ribs well set out; back straight and wide; hips wide, but not prominently so; rump wide, and thighs deep; teats and twist good. No. 50, Mr. Stratton's cow, was also commended; she is also a beautiful animal, very cylindrical in form; head and horns good; hips out, but well formed and natural; teats good; tail rather low: both cows match admirably, and two such are seldom seen. No. 53, Mr. Moorhouse's cow, was commended. This is a deeply well-formed cow, and in good proportion; her chine and loin rather thin and bare; good hair, and plenty. This was a highly interesting class.

Class 5. Heifers in milk or in calf not exceeding 3 years old. The 1st prize was awarded to No. 65; she has a beautiful breast, chine, and extraordinary back throughout, head and horns fair; fine in offal, teats very heavy, hips rather narrow, thighs long, and good tail a little elevated; twist not full, flank good; very fine animal of her class. The 2d prize was awarded to No. 72; this is of very superior quality and good frame, admirable head and horns, breast exceedingly good, back very level and well thrown out, rump good, but hips not wide, teats large, twist good, shoulder and breast full, not quite high or long enough. No. 66, Mr. Towneley's heifer, is highly commended; a truly good animal, chine, shoulder, and breast wide and full; a compact cylindrical frame, teats large, but thighs and twist not full; head and horns capital. No 59, Mr. Stratton's heifer, was commended; a very compact frame, thick and good throughout, good head, greater teats, well formed thighs, deep in form.

Class 6. Yearling heifers. The first prize was awarded to No. 81; this is a compact animal, very thick and well formed, very small waxy horns, deep chest, good chine, ribs well springing, full thighs, but flanks and twist not full enough; a capital girth, arms full, head, muzzle, and neck all right. The second prize was awarded to No. 90; she is very cylindrical in form, breast very good, all her under parts are good, making a deep frame of large proportions, and denoting much good lean flesh; horns fine. No. 91, Mr. Stratton's heifer, was highly commended; she is a large well-made animal for her class, deep frame, but girth defective; good rump. No. 93, Mr. Fletcher's heifer, is highly commended; she is very compact in form but rather short, good girth, hips rather narrow, otherwise good hindquarters; rump long, flank and thighs deep and good. No. 75, Viscount Hill's heifer, was commended; very level back, hips rather narrow, tail stands too high. No. 76, Mr. Stratton's heifer, was commended. She is of deeper make than the preceding, with very good hindquarters, chine and girth defective, head good, and horns fine, ribs deep and springing. No. 79, Mr. Crawley's heifer, was commended; a very cylindrical frame, neck and horns too thick, good hips and tail. No. 85, Mr. Marjoribank's heifer, was commended; a complete little heifer, except her chine being rather thin. The number of commendations in the short-horn classes speaks for itself, we think; we do not recollect so many good animals; we have seen better individual specimens occasionally, but not so many good ones.

We are compelled to defer our remarks upon the other cattle classes until next week. The Hereford class is not numerous, but the animals are mostly first-class specimens. Lord Berwick's bull has rarely been surpassed. The Earl of Radnor's bull is of beautiful symmetry and quality, but small in comparison. The class of cows has some good animals in it. The heifers very handsome. The Devons, as a whole, are of excellent quality, very fine in offal and perfect in symmetry, but not numerous. The Ayrshires, with the exception of a good old bull, were not well represented. The Angus and other polled breeds were very few, but well selected. The Angus bull was much admired. The special prize classes were exceedingly well competed for, and many first-rate animals were shown, proving that Galloways still hold a high position, and are well worthy of it. We hope to give an analysis of the prize animals next week.

PRIZES—STOCK.

SHORT-HORNED CATTLE.

Judges—Captain Thomas Ball, Messrs. Richard Dudding and Thomas Parkinson.

Class 1. For the best bull, over 2 and under 4 years old, 18 entries: 30*l.* to R. Booth, of Warlaby, for "Windsor;" 15*l.* to Lord Feversham, for "Gloucester," bred by the late Earl Ducie.—Highly Commended: Charles Towneley, for "Voltigeur."—Commended: William Fletcher, of Mansfield, for "Champion."

Class 2. For the best bull, under 2 and over 1 year old, 18 entries: 25*l.* to C. Towneley, for "Master Butterfly;" 15*l.* to F. H. Fawkes, of Farnley Hall, for "John o'Groat."—H. C.*: C. Towneley, for "Richard Cœur-de-Lion."—C.: F. Fowler, of Baldcock, for "Duke of Bedford."

Class 3. For the best bull-calf, above 6 and under 12 months old: 5*l.* to C. Towneley for "Musician."—C. Viscount Hill, for "Hotspur."

Class 4. For the best cow in milk or in calf: 20*l.*; R. Booth, for "Bridesmaid;" J. Douglas, of Drem, for "Rose of Summer."—H. C.: J. Booth, for "Venus Victrix."—C.: R. Stratton, of Swindon, for "Matchless the Second;" T. Moorhouse, of Penrith.

Class 5. For the best heifer under 3 years old, 10 entries: 15*l.* to C. Towneley for "Roan Duchess the Second; 10*l.* to R. Booth, for "Bride Elect."—H. C.: C. Towneley, for "Blanche 6th."—C.: R. Stratton for "Salthorp Rose 3d."

Class 6. For the best yearling heifer, 10*l.*: to J. Hall, of Worksop, for "Canney;" 5*l.* to C. Towneley, for "Vestris."—H. C.: C. Towneley for "Victoria;" W. Fletcher, of Mansfield, for "Laura."—C.: Viscount Hill for "Heresy;" S. Marjoribanks, Watford, for "Sunflower;" G. Sainsbury, of Corsham, for, "Little Flirt."

HEREFORD CATTLE.

Judges—Messrs. H. Chamberlain, E. L. Franklin, and H. Trethewy.

Class 1. For the best bull, over 2 years and under 4 years old, 30*l.*, Lord Berwick: 15*l.* to Earl Radnor.—H.C.: R. Hill, of Golding Hall, near Shrewsbury; J. Monkhouse, of the Stow, near Hereford; W. S. Powell, of Castle Street, Hereford. The judges commended the whole of class 1, and class 6.

Class 2. For the best bull, under 2 and over 1 year old: 25*l.* to Lord Berwick; 15*l.* to J. Monkhouse.

Class 3. For the best bull calf, above 6 and under 12 months old: 5*l.* to E. Williams, of Llowess Court, near Hay.

Class 4. For the best cow in milk or in calf: 20*l.* to J. Monkhouse; 10*l.* to P. Turner, Pembridge, Leominster.

Class 5. For the best heifer, in milk or in calf, under 3 years old: 15*l.* to J. Walker, of Westfield House, Holmer, near Hereford; 10*l.* to W. Perry, of Cholstrey, near Leominster.

Class 6. For the best yearling heifer: 10*l.* to Lord Berwick; 5*l.* to W. Maybery, of Brecon.

DEVON CATTLE.

Class 1. For the best bull, over 2 and under 4 years old: 30*l.* to J. Quartly, South Molton; 15*l.* to W. Farthing, of Stowey Court.

Class 2. For the best bull, under 2 years and over 1 year old: 25*l.*, to G. Turner, of Barton: 15*l.* to W. Farthing.

Class 3. For the best bull calf, above 6 and under 12 months old: One entry. No award.

Class 4. For the best cow: 20*l.* to G. Turner: 10*l.* to G. Turner. H. C.: W. Farthing.

SCOTCH CATTLE,

Excepting Galloway Cattle, which are provided for in the special prizes offered by G. H. Head, Esq.

Judges—Messrs. P. Graham, Barns, R. Hector, and W. M'Culloch.

I. AYRSHIRE.

Class 1. Bull of any age: 10*l.* to J. Stewart, of Strathaven.

Class 2. Yearling bull: 10*l.* to J. Stewart.

Class 3. Cow of any age: 10*l.* to W. Muir, of Hardington Mains, Biggar.

Class 4. In-calf heifer: 5*l.* to J. Stewart.

* H. C. stands for Highly Commended.

II. ANGUS AND OTHER POLLED BREEDS.

Class 1. Bull of any age: 10*l.* to W. M'Combie, of Tillyfoord, Aberdeen.

Class 2. Yearling bull: No competition.

Class 3. Cow of any age: 10*l.* to W. M'Combie.

Class 4. In-calf heifer: 5*l.* to W. M'Combie.

III. HIGHLAND AND OTHER HORNED BREEDS.

Class 1. Bull of any age: No competition.

Class 2. Yearling bull: 10*l.* to Neill Malcolm, of Poltalloch, Lochgilphead.

Class 3. Cow of any age: 10*l.* to Neill Malcolm.

Class 4. In-calf heifer: No competition.

HORSES.

We are not disappointed with the result of the horse show. Our expectations were raised upon coming so completely within the reputed region of horse breeding, and these expectations have been fully realised. The prizes were never, we think, more fairly awarded. Real practical utility is appreciated. We have a full report in hand, but must postpone it for a week.

HORSES.

Judges—Messrs. J. H. Bland and T. Hunt.

Class 1. Stallions for agricultural purposes, foaled previously to the 1st January, 1853: 30*l.* to E. & M. Reed, Chester-le-Street, Durham; 20*l.* to S. & R. Spencer, Flecknor, Daventry.

Class 2. Stallions for agricultural purposes, foaled in the year 1853: 20*l.* to R. Smith, Ladyland, Dumfries; 10*l.* to H. Bailey, Berkley, Gloster.

Class 3. Agricultural stallion, foaled in the year 1854: 15*l.* to S. & R. Spencer.

Class 4. Mares and foals for agricultural purposes: 20*l.* to D. Bird, Catterlen Hall, Penrith; 10*l.* to R. Murray, Park Gate Hall, Wigton.

Class 5. Two-year-old fillies for agricultural purposes: 15*l.* to E. Holland, M.P., Evesham; 10*l.* to E. Holland, M.P.

CLYDESDALE HORSES.

Class 1. Stallion foaled previously to the 1st January, 1853: 20*l.* to C. Phillips, Brampton, Cumberland.

Class 2. Stallion foaled in the year 1853: 15*l.* to J. Newbigging, Redhall, Ecclefechan.

Class 3. Mare, with her foal at her foot: 10*l.* to J. Douglas, Drem.

Class 4. Filly, foaled in the year 1853: 5*l.* to J. Patterson, Langholm.

SHEEP.

The show of Leicesters was unusually large; the Southdown class considerably less, and the long-wool class very much smaller than last year. The mountain and Cheviot sheep, however, were very numerous, amounting to more than double the number of any local class ever exhibited in the Society's show-yards. Every class was admirably sustained, and many splendid animals were shown. Mr. Sanday stands high in the Leicester classes; Mr. Rigden, in the absence of "Jonas Webb," equally so in the Southdown classes; Mr. Lane keeps up his reputation in the long-wool classes, and we think the individual animals shown by these breeders quite equal to those formerly exhibited by them. Our detailed report must be postponed. The following is the award of prizes:—

LEICESTERS.

Judges—Messrs. R. B. Aylmer, W. Torr, and J. Wright.

Class 1. Shearling rams: 25*l.* to W. Sanday, of Holmepierrepont; 15*l.* to T. E. Pawlett, of Beeston.

Class 2. Rams of any other age: 25*l.* to W Sanday; 15*l.* to W. Sanday.

Class 3. Pens of five shearling ewes of the same flock: 20*l.* to W. Sanday; 10*l.* to W. Sanday.

SOUTHDOWN, OR OTHER SHORT-WOOLLED SHEEP.

Judges—Messrs. G. Brown, H. P. Hart, and J. Waters.

Class 1. Shearling rams: 25*l.* to W. Rigden, of Hove, Brighton; 15*l.* to the Earl of Chichester, of Stanmer Park.

Class 2. Rams of any other age: 25*l.* to W. Rigden; 15*l.* to W. Rigden.

Class 3. Pens of five shearling ewes of the same flock: 20*l.* to H. Lugar, of Hengrave, Bury St. Edmunds; 10*l.* to Lord Walsingham.

LONG-WOOLLED SHEEP. NOT QUALIFIED TO COMPETE AS LEICESTERS.

Judges—Messrs. H. Aylmer, T. B. Colton, and N. C. Stone.

Class 1. Shearling rams: 25*l.* to W. Lane, of Northleach; 15*l.* to W. Hewer, of Northleach.

Class 2. Rams of any other age: 25*l.* to W. Garne, of Northleach; 15*l.* to W. Lane.

Class 3. Pens of 5 shearling ewes of the same flock: 20*l.* to T. Beale Browne, of Hampen Andoversford; 10*l.* to W. Lane.

MOUNTAIN SHEEP.

1. HERDWICKS.

Judges—Messrs. W. Dodd, R. Donkin, and A. Douglas.

Class 1. Shearling ram: 7*l.* to G. Robinson, of Orton Hall.

Class 2. Ram of any other age: 8*l.* to J. Mounsey, of Askham.

Class 3. Pen of five shearling ewes: 5*l.* to G. Robinson.

2. OTHER BLACK-FACED MOUNTAIN SHEEP.

Class 1. Shearling ram: 7*l.* to H. Shield, of Allendale, Northumberland.

Class 2. Ram of any other age: 8*l.* to C. Summers, of Haydon Bridge.

Class 3. Pen of five shearling ewes: 5*l.* to J. Brydon, of Langholm.

PIGS.

The number of large and small-breed boars, together with the sows, and pens of sow pigs, was 84, being 53 less than last year. We did not observe so many specimens of fine quality and superior breeding, but there were some remarkable animals, particularly the prize small-breed sow, of great size and beauty. Too many of the boars and sows were much over-fed, though, perhaps, the class in general was not more open to blame in this respect than in former years. We are glad to find that the judges had been awake to their duty, and determined to have proper order observed in the pig classes, inasmuch as they disqualified several animals for being entered in the wrong class. The stewards, too, had disqualified several animals because their teeth told a greater age than the exhibitors stated

in their certificates. We shall give a full report next week. The following is the prize list :—

Judges—Messrs. P. Halse, H. Eddison, and W. Hesseltine.

Class 1. Boars of a large breed: 10*l.* to T. Horsfall, of Burley Hall, Otley, Yorkshire; 5*l.* to C. Jackson, of Goodram Gate, York.

Class 2. Boars of a small breed: 10*l.* to W. Hatton, of Otley; 5*l.* to G. Turner, of Barton.

Class 3. Sow of a large breed: 10*l.* to J. Harrison, jun., of Heaton Norris, Stockport.

Class 4. Sow of a small breed: 10*l.* to R. H. Watson, of Bolton Park, Wigton.

Class 5. Pen of 3 breeding sow-pigs of a large breed, of the same litter, above 4 and under 8 months old: 10*l.* to W. I. Sadler, of Bentham Purton, Swindon.

Class 6. Pen of 3 breeding sow-pigs, of a small breed, of the same litter, above 4 and under 8 months old: 10*l.* to R. H. Watson, of Bolton Park, Wigton.

SPECIAL PRIZES.

Given by the Carlisle Local Committee.

CHEVIOT SHEEP.

Judges—Messrs. W. Dodd, R. Donkin, and A. Douglas.

Class 1. Rams not more than four shear: 15*l.* to T. Elliot, of Hindhope, Jedburgh; 7*l.* to T. C. Borthwick, of Langholm.

Class 2. Shearling rams: 15*l.* to T. Elliot; 8*l.* to T. C. Borthwick.

Class 3. Pens of five ewes not more than four shear: 10*l.* to T. C. Borthwick; 5*l.* to the same.

Class 4. Pens of five shearling ewes or gimmers: 10*l.* to T. C. Borthwick; 5*l.* to T. Elliot.

HORSES.

Judges—Messrs. W. Greaves and W. Walker.

Class 1. Harness mare, with foal at foot: 15*l.* to Sir Wilfred Lawson, Bart., of Brayton.

Class 2. Three year old harness gelding: 10*l.* to Sir W. Lawson, Bart.

Class 3. Mare for breeding hunters, with foal at foot: 15*l.* to T. Swarbreck, of Sowerby, Thirsk.

Class 4. Three year old gelding for hunting: 10*l.* to R. Barton, of Barrack Town, Carlisle.

Class 5. Three year old cart filly: 10*l.* to Miles Bell, of Brunstock, Carlisle.

Class 6. Three year old cart gelding: 10*l.* to Ann Tinning, Oak Bank, Longtown.

Class 7. Two year old cart gelding: 10*l.* to William Stordy, Moorhouse, Carlisle.

GALLOWAY CATTLE.—Given by G. H. HEAD, Esq.

Judges—Messrs. P. Graham, Barns, R. Hector, and W. McCullock.

Class 1. Bulls not more than 4 years old on the 1st of July, 1855: 25*l.* to J. Graham, of Dalbeattie; 10*l.* to J. Carruthers, of Kirkhill, Moffat.

Class 2. Bulls, calved since the 1st of July, 1853, and more than 1 year old: 15*l.* to J. Beattie, of Newble House, Annan; 10*l.* to J. Birrell, of Guards, Gretna Green.

Class 3. Cows in calf or milk: 15*l.* to J. Beattie; 10*l.* to John Grainger, of Souterfield, Abbey Holme.

Class 4. Pairs of heifers in calf or milk, and not exceeding 3 years old: 10*l.* to G. Riddick, of Lockerbie; 5*l.* to J. Pearson, of Langrigg, Cumberland.

THOROUGH-BRED STALLIONS.—GIVEN BY R. FERGUSON, ESQ., MAYOR OF CARLISLE.

Judges: Messrs. W. Greaves and W. Walker.

COACHING STALLIONS.

Class 1. Thorough-bred Stallion: 40*l.* to No. 783, viz. to R. Ferguson, of Harker, Carlisle.

Class 2. Coaching Stallion: 30*l.* to No. 797, viz. to J. Shaw, of Acomb Hall, York.

[We are unable in this Number of our Journal to report on the Poultry Show. The number of pens of poultry shown is 185, being 110 less than at Lincoln. The Dorking fowl class comprised some of the most admired specimens; and the two classes of Dorkings, the entire class of Spanish fowls, game fowls, and the Aylesbury ducks received a general high commendation.]

THE PAVILION DINNER.

Every seat was occupied. The presiding notabilities were, beside the fine spirited manly President, Mr. Miles, the Duke of Cleveland, Viscount Dillon, Lord Berners, the Baron Ricasoli (a large landed proprietor from Tuscany), M. de la Trehonnois, of Paris, Sir J. Maxwell, the Very Rev. the Dean of Carlisle, Sir James Graham, Bart., M.P., Sir Stafford Northcote, the High Sheriff of the County, C. W. Hoskyns, Esq., &c.

The loyal toasts were enthusiastically responded to.

The Baron Ricasoli responded in Italian to the toast given to distinguished foreigners present. He spoke a most complimentary language, and used it eloquently in reference to the benefits that result from international alliance and concourse of all kinds.

The toasts had been so arranged as to omit the Army and Navy, but the meeting proving rebellious to this arrangement, the President proposed the Army and Navy; and Sir J. Maxwell responded first for the Navy, while the Duke of Cleveland returned thanks, as the senior officer in the room, for the Army.

Lord Berners, in proposing the health of the President, passed a very high eulogium, which was most cordially endorsed by the cheers of the meeting.

The President, in responding to this toast, expressed a just pride and satisfaction at presiding over such a meeting—the largest he had ever seen in that Pavilion. He spoke of the character of the Society of England being inexclusive. Then referring to the excellence of the two departments of the Show, the implements and cattle, he stated that if the number of implements was less than in former years, the quality of what really were placed in competition amply compensated for the defect in point of quantity. When he recollected the state of agriculture in England 18 or 20 years ago, and compared it with the present scientific attitude of farming, he could not but congratulate the country upon her visible and surprisingly rapid improvement. Twenty years ago good farming was the exception; now he was glad publicly to state that he regarded it as no longer the exception, but the rule. "You avoid a bad farmer," remarked the hon. gentleman, "as you avoid the cholera. To what is this owing? To the enlightenment that has come to the popular mind with respect to the clearing of land, the benefits of autumn fallowing, to the large quantities of artificial manure that are being used annually. One of the Parliamentary returns shows that in 1834 there were imported into England 2281 tons of guano, and in 1854, 235,111 tons, so that taking it at 10*l.* per ton, there is found to have been expended in 1841, 28,808*l.*; whereas in 1854 there was expended the prodigious sum of 2,351,100*l.* to secure the benefits of this one manure to the farmer. The use of the nitrates, the only other kind of artificial that the returns take cognisance of, is doubled in the same time. And when we think of the immense number of bones that go to make up the superphosphate manures distributed the length and breadth of our country, we may well arrive at the conclusion that the farmer is not asleep, and that where he sees an outlay of capital will benefit him, he hesitates not to adopt it." The President alluded to the admirable results of the associative principle, as exhibited by the meetings of the Society, and the meetings of the local societies throughout Great Britain. He praised the beneficial effects of the Society's Journal, having spread far and wide the experience of experimentalists, studying always to confine and consolidate the practical results of such meetings as the one over which he presided—doing their part to the better feeding of the millions of the country. And while referring to the Journal he paid a most just tribute to the memory of its deceased editor, the talented Philip Pusey. In describing the pleasure he received from a recent visit, in company with some of his tenantry, to Paris, he mentioned the unexampled success there of the English exhibitors, Jonas Webb taking a prize for every other animal, or nearly so, on which account the Emperor has ordered that a special medal shall be struck off to commemorate so honourable a fact.

For the societies of Scotland and Ireland Capt. Ball responded in a very appropriate speech for the Irish Society, and Sir J. Maxwell, as a member of the Highland Agricultural Society, and in the absence of Mr. Alexander Graham, for the Scotch Society. Sir J. Maxwell merrily alluded to the border feuds that did once exist. He would do away with the exclusive spirit of clanship, and was glad that the representatives of the three sister societies were in Paris looked upon as one and the self-same body, and that in this united capacity they presented an address to the Emperor before they left France. Captain Ball hoped that this alliance might not merely exist in name, but ultimately grow to the proportion of a great and splendid fact.

Mr. Thompson proposed the Mayor and Corporation in a humorous speech, full of good feeling, to which the Mayor, Mr. Ferguson, responded very fittingly indeed, though unfortunately for the meeting not in a voice sufficiently strong to be heard many yards in front of him.

Sir James Graham rose from the body of the Pavilion and proposed this toast—agriculture, manufacture, commerce. He complimented Mr. Miles, gracefully alluded to Mr. Pusey and his indefatigable labours as Editor of the Journal, reminded the meeting that while we regarded with pride our present advance, we must not cease to remember to whom we owe it—our predecessors Mr. Coke, Sir J. Sinclair, &c. They introduced drill husbandry, Turnip culture, and folding upon arable land, and this is the foundation of our present successes—the starting post, in fact. Sir James spoke upon the intimate relations that exist between agriculture, manufacture, and commerce—relations the repeal of our import duties has tended so much to enlarge and strengthen.

The Dean of Carlisle spoke to the toast "the Labouring Classes," with right good feeling. He was followed by Sir Stafford Northcote, who proposed thanks to the Railway Companies for their co-operation in promoting the objects of the Society, and Mr. Hasell responded. Col. Challoner then proposed "the healths of the Stewards and Judges of the Show," to which Mr. Fisher Hobbs made answer. With the "Health of the President-Elect," proposed by Mr. Marshall, M.P., the proceedings terminated, and the vast throng, consisting of some 1000 or 1200 people dispersed, dispersed again to encounter the Cumberland shower baths!

Notices to Correspondents.

DIFFERENCE BETWEEN LIVE AND DEAD WEIGHT: *O C J.* An imperial stone of live sheep will ordinarily yield a Smithfield stone of mutton—*i. e.*, for seven of the living animal there will be four of carcase; but we do not know what there may be in the case of lamb.

FARM MANAGEMENT: *H G., Lincoln.* We are glad to give all the information in our power on particular points in farm practice when the information or decision is needed, and that is properly the use that should be made by inquirers of these columns; and when the subject is of more than merely individual interest, we are willing to do more than this, and supply such information as we can on the whole scheme of farm management—the capital needed and profits to be expected, &c. &c.—to which your inquiry extends; but both space and time are needed for such a discussion, and we cannot undertake it except at our leisure.

FOUL TURNIPS: *J Mc.* Many weeds are food and lodging for the fly. Your bailiff was wrong.

M E B asks any of our readers to inform him how best to preserve Peas and French Beans for winter use, the Peas either shelled or unshelled.——One of the best fastenings for gates consists of a drop piece on the post, and a mere projecting bolt on the gate. The bolt sliding against the drop lifts it until the gate is against the post, when the piece drops and holds it.

THISTLES: *Shem.* Make use of this soft weather to pull them. A little perseverance in doing this over so small a piece will be better than breaking the land up, provided the Grass is otherwise good.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with entire confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

EXTRACTS FROM MEDICAL TESTIMONIALS:—

ARTHUR H. HASSALL, M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—and this unknown to yourself—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

The MEDICAL CIRCULAR, May 10, 1854 —

"We unhesitatingly recommended Dr. de Jongh's Light Brown Cod Liver Oil as the best for medical purposes, and well deserving the confidence of the profession."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and IN THE COUNTRY, by respectable Chemists. Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

CHASE'S

BEETLE POISON.

ENTIRELY FREE FROM DANGER TO HUMAN LIFE, AND PERFECTLY HARMLESS TO CATS AND DOGS.

A Safe and most Effectual Destroyer of Black Beetles and Cockroaches; one trial alone will suffice to prove its great efficacy, and one box will destroy thousands. The great advantage in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.

Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.

Sold in boxes at 1s. each, by THOMAS CHASE, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all wholesale medicine vendors.

To the Editor of the "Cottage Gardener," July 3d, 1855.

"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*

(ED.—This is not a mere puff, but sent to us by a gentleman who has been benefited as he states.)

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses peculiarly nourishing powers in the growth, restoration, and improvement of the human Hair, and is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, produces a thick and luxuriant growth, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. In the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulative operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3s. 6d. and 7s.; Family Bottles (equal to four small), 10s. 6d.; and double that size, 21s. CAUTION.—On the wrapper of each bottle are the words, Rowlands' Macassar Oil, in two lines.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2s., or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN ——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

BASS'S EAST INDIA PALE ALE, BASS'S MILD BURTON ALE, and BARCLAY'S PORTER and STOUT, in 18-gallon Casks, Bottles, Half-Bottles, and Imperial Pints.—BERRY, BLOMFIELD, & Co., 3, St. James's Street, London.

DEVONSHIRE CYDER.—A three dozen case (large bottles), of the very best DEVONSHIRE CHAMPAGNE CYDER, will be forwarded to any address on receipt of a Post-office order for 21s., payable to JOHN E. RENDLE, Martin Street, Octagon, Plymouth. Case and bottles, value 8s., included.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption; and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

THE COMING PILL.—"THE RIGHT PILL FOR EVERY COMPLAINT!"—PAGE WOODCOCK'S WIND PILLS for Wind in the Stomach, Indigestion, Biliousness, Liver Complaints, and all diseases arising from a disordered state of the Stomach and Bowels, will beat the World for efficacy! Try them, and you will say you have got the right Pill this time.—Sold by all respectable Medicine Vendors everywhere, at 1s. 1½d., 2s. 9d., and 4s. 6d. If difficulty occur in remote places, send stamps to PAGE D. WOODCOCK, Lincoln, and you will have them by return of Post.

HOLLOWAY'S PILLS ARE WITHOUT DOUBT THE VERY BEST MEDICINE FOR INDIGESTION AND FLATULENCY.—The test of years have proved their efficacy in curing Bile, Flatulency, Indigestion, Sick Headache, Nervousness, and debilitated constitutions. The well-known properties of these excellent Pills are too highly appreciated in the present day to require any encomium here, as they are resorted to by rich and poor in every nation; and their properties are to invigorate the body, strengthen the faculties of the mind, and restore the invalid to a perfect state of good health.—Sold by all Medicine Vendors throughout the world; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. PISDICY, Smyrna; and E. MUIR, Malta.

PRUDENCE.

HOW much pain, regret, and evil may be avoided by timely forethought! If it be desirable to economise money and time, is it not still more important to economise our health?

The prudent man pays attention to the slightest derangement in his physical organisation. When he finds himself "out of order," he should resort to the world-famed remedy, PARR'S LIFE PILLS, and thus the incipient malady will be checked.

In all quarters of the globe the reputation of PARR'S Life Pills is fully established; and it is a fact, that no "household words" are more familiar with the people than those of the invalid, who speaks of health restored as the consequence of using PARR'S Pills.

☞ Ask for PARR'S Life Pills.

Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay & Sons, 95, Farringdon Street; Sutton & Co., 10, Bow Churchyard; Hannay & Co., 63, and Sangar, 150, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in town and country. In boxes, price 1s. 1½d., 2s. 9d., and in family packets 11s. each. Directions with each box.

TO BE LET, at Haxby, near York, within a short distance of the Railway Station, a neat and compact COTTAGE, with requisite Outbuildings, and Nine Acres of Land, well adapted for a Nurseryman, Seed Grower, or Market Gardener, and may be entered on at Michaelmas next.—For particulars, apply to Messrs. BAINBRIDGE & HEWISON, Nurserymen and Seedsmen, or Messrs. ACTON & SON, Auctioneers, Low Ousegate, York.

TO GARDENERS AND OTHERS.

TO BE SOLD, a BUSINESS, consisting of Jobbing and Market Gardening, together with a Florist and Seed Business, with a good connection, and capable of enlargement, known as the Dane Nursery, Margate, Kent; with a good Family Residence, and about two acres of Land, walled in, and in excellent condition, with a good supply of water. Rent, 30l. per annum. The Greenhouses, Pits, and all Erections, with Stock in Trade, &c., to be taken at valuation, with possession at Michaelmas next, old style (or immediately, if required).—To treat, and for further particulars, apply to Mr. HENRY STROUD, on the premises.

Satisfactory reasons given for leaving. No agents need apply.

NURSERY, SEED, AND FLORIST'S BUSINESS.

TO BE SOLD, the Goodwill, Stock, Crops, and Effects, of a long-established Business, situate about 15 miles from London, in a populous country, and well adapted in every respect for an enterprising person possessed of capital.—For further particulars apply to MR. W. B. PATERSON, Solicitor, Bride Court, New Bridge Street, Blackfriars, London.

Sales by Auction.

SPECIMEN HEATHS, ETC.—CLAPHAM PARK.

MR. J. C. STEVENS is favoured with instructions to sell by Auction, on the premises, on TUESDAY, 31st July, at 12 o'clock, the collection of Specimen Heaths and Azaleas, the property of the late Wm. Hy. Gilliat, Esq., of Clapham Park, including some of the finest Plants in the country. Also the house in which they have been cultivated.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. STEWART, the Head Gardener on the premises, and of Mr. J. C. STEVENS, 38, King Street, Covent Garden.

NORBITON NURSERY.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. J. WILLMER is instructed by Mr. S. Hook to Sell by Auction, on the Premises, Norbiton Nursery, near Kingston, on MONDAY, August 6th, at 12 o'clock, the whole of the STOCK of the above Nursery, which comprises a choice and valuable collection of Geraniums, Fuchsias, Chrysanthemums, Dahlias in pots; a Span-roof Propagating House, Pits, Lights, Boxes, Striking Glasses, Garden Pots, Tools, a quantity of Leaf Mould, &c.—May be viewed the day preceding and morning of sale; and Catalogues had on the premises, and of the Auctioneer, Sunbury, Middlesex.

EPSOM.

MR. H. ANDREWS will sell by Auction, without reserve, on MONDAY, August 6th, at 2 o'clock, on the premises of the Local Board of Health (being part of Epsom Nursery), the erection of five greenhouses, about 30 feet by 13 feet each, with front and top-lights, flower-stage, stone platforms, hot-water pipes; the materials of five pits, lean-to shed, a quantity of greenhouse plants, &c. May be viewed any time previous to the Sale, and Catalogues had at the principal Inns in the neighbourhood, and of Mr. HENRY ANDREWS, Surveyor and Estate Agent, Epsom.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

COTTAM AND HALLEN, Engineers, Founders, &c.,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

HORTICULTURAL SOCIETY, 21, Regent Street.—A SPECIAL GENERAL MEETING of this Society will be held on TUESDAY, August 14, at 1 P.M. precisely, to elect a new Member of Council and Treasurer in the room of Dr. Jackson, deceased.—By order of the Council,

August 1. W. B. Booth.

NATIONAL FLORICULTURAL SOCIETY, 21, Regent Street, 28th July, 1855.

NOTICE is hereby given that at the next Meeting of this Society, to be holden on THURSDAY, August 9, Special Prizes will be awarded for Hollyhocks, three distinct spikes, 15s. & 10s.; Ditto, twelve distinct blooms, 10s. & 7s. 6d.; Verbenas, ditto, 10s. & 7s. 6d. Extra Prizes will also be awarded for Roses, twelve distinct blooms, 10s., 7s. 6d., & 5s.; Dahlias, six distinct blooms, 10s., 7s. 6d., & 5s.; Fancy ditto, six ditto, 10s., 7s. 6d., & 5s.; Fuchsias, three distinct varieties (plants), 15s., 10s., & 7s. 6d.; Carnations, six distinct blooms, 10s., 7s. 6d., & 5s.; Picotees, six ditto, 10s., 7s. 6d., & 5s.; Yellow ditto, three ditto, 7s. 6d., 5s., & 5s. Exhibitors to provide their own show boxes. Everything intended for Exhibition must be at 21, Regent Street, before 12 o'clock: whatever arrives later will be absolutely excluded from Competition for Prizes. The Prizes will be announced at 3 o'clock. Open to all competitors. No entrance fee.

Certificates as usual for Seedling Carnations, Picotees, Fuchsias, Roses, Antirrhinums, Verbenas, Phloxes, Liliums, Dahlias, Petunias, Hollyhocks, &c. &c. These will be received up to 1 o'clock. The Censors summoned are Messrs. Lochner & Baker, for Carnations, Picotees, &c.; Messrs. Cook, Holmes, & Pope, for Dahlias, &c; Messrs. Lidgard, Parsons, & Moore, for Hollyhocks, Roses, &c.; Messrs. Hamp & Robinson, for Verbenas, Fuchsias, &c.

Free Admission to visitors by Cards only, to be obtained at 21, Regent Street. John Edwards, Secretary.

ROYAL PAVILION, BRIGHTON.

THE BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY will hold their Autumn Exhibition of PLANTS, FRUITS, CUT FLOWERS, &c., on WEDNESDAY and THURSDAY, 12th and 13th of September next, at the above splendid suite of Rooms and Grounds, on the same grand scale as former years. Prizes are offered with the same liberality as previously. Also the Railway Cup, value 10 guineas, for the best 24 Show Dahlias for Amateurs. By the liberality of the Railway company, all Plants, &c., will be conveyed to Brighton and back, carriage-free, from all stations on the lines. Schedules can be had on application to E. Spary, Superintendent of the Exhibition; or the Secretary, E. Carpenter, 45, Lavender Street, Brighton. By order of the Committee, E. Carpenter, Secretary.

TO NURSERYMEN AND OTHERS.

Sewers' Office, Guildhall, Aug. 2, 1855.

CITY OF LONDON CEMETERY.—The Commissioners of Sewers of the City of London, acting as the Burial Board for the said City, hereby give notice that they will meet at Guildhall on Tuesday, the 11th day of September, at 12 o'clock precisely, for the purpose of receiving TENDERS for the supply of TREES and SHRUBS for the Cemetery now being formed at Little Ilford, in the county of Essex.

Forms of Specification with Schedules, to which the prices are to be affixed, may be obtained on and after the 20th day of August, at the Office of Mr. William Haywood, Surveyor to the Commissioners, 14, Old Jewry Chambers; or at the Office of Mr. Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square.

Joseph Daw, Principal Clerk.

CARNATIONS AND PICOTEES in full bloom for Sale; 150 stove pots of the best varieties, all Show Flowers. Each pot will make from four to eight pairs of plants.—To be seen at Mr. R. Tasker's, Florist, Mayfield Road, Dalston, London.

WHITE LISBON ONION SEED.—Large buyers can be supplied with White Lisbon Onion Seed in quantity.—Apply to Mr. Henry Clarke, Seed Merchant, 39, King Street, Covent Garden.

TRIPOLI ONION.—The trade can be supplied with SEED of the true flat Tripoli Onion, by Nutting & Sons, Seedsmen, 46, Cheapside, London.

WANTED, BOX EDGING, two years old, sufficient to plant 530 yards.—Apply, stating lowest price, to John Sutton, Gardener, Alton, Hants.

CALCEOLARIA AND CINERARIA SEED.

J. DOBSON AND SON are now sending out Seeds of the above, saved from an unequalled collection, in packets. Cineraria, 1s.; Calceolaria, 1s. 6d., 2s. 6d., 3s. 6d. and 5s. each.

Woodlands Nursery, Isleworth.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2s. 6d. and 5s. each; the finest quality of CALCEOLARIA is only offered at 5s.; second quality, 2s. 6d.

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, Aug. 4.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1s. 6d. and 2s. 6d. each. Also choice CINERARIA seed saved from the finest named varieties, at 1s. 6d. and 2s. 6d. per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

MAJOR'S CALCEOLARIA SEED.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to inform his friends that his Calceolaria Seed for this season is now ripe, and may be had in packets at 2s. 6d. and 5s. each. The 5s. packets will be equal to three 2s. 6d. ones. The seed is produced from rich and beautiful varieties (for which his collection stands unrivalled), therefore large, well-formed flowers, and beautiful colours and markings may reasonably be expected. The present, up to the latter end of August, is a proper time to sow to insure an early spring bloom. Postage stamps are requested in return.

PRIZE CALCEOLARIAS.—A few packets of seed saved from the group of Seedling Calceolarias to which a Prize was awarded at the Great Exhibition at the Crystal Palace, are now ready at 10s. 6d. each. These seedlings are unrivalled for immense size of flower, richness of colour, and strong vigorous growth. Seed from other Choice Seedlings at 5s. per packet.

Address to William Sanford, Gardener to Mr. Henchman, Edmonton, near London. No letter will be attended to unless enclosing a Post Office Order or a [illegible] stamp.

ROSES.

JAMES MITCHELL begs to announce that his unrivalled collection of ROSES is now in fine bloom.

Piltdown Nurseries, Maresfield, Sussex, Aug. 4.

ROSES.

GEORGE CLARKE begs to announce that his fine collection is now in full bloom, and will continue so till autumn.—Streatham Place Nursery, Brixton Hill, near London.

DUTCH FLOWERING BULBS.

JAMES CARTER AND Co.'s comprehensive CATALOGUE OF DUTCH AND CAPE BULBS, AND SEEDS, for Autumn sowing, will be published on the 1st of September next, and will be forwarded, free of charge, and post paid, upon application to James Carter & Co., 238, High Holborn, London.

NEW PELARGONIUMS raised by J. Beck, Esq., of Isleworth; and T. White, Esq., of Wethersfield, Essex. Catalogues with full descriptions and prices of these fine varieties forwarded post-free for one stamp, on application to John Dobson & Son, Florists and Seedsmen, Woodlands Nursery, Isleworth.

EMPEROR NAPOLEON—A New Scarlet Geranium.

JOHN BUTCHER is now sending out the above splendid Geranium; a seedling raised by himself was exhibited June 13th at the Royal Botanic Gardens, Regent's Park, London. See *Gardeners' Chronicle*, June 16. Good Plants for immediate Bedding, 18s. per doz.; extra size, 2s. 6d. London agents, Messrs. Dawe, Cottrell, & Bunham.

Royal Nursery, Stratford-on-Avon—August 4.

HARDY AND SON, Seed Growers, &c., Maldon, Essex, are prepared to send to any address, free by post, their best selected kinds of CABBAGE and LETTUCE SEEDS, for July and August sowings, in one or four varieties. Also for early sowing, one or three varieties of their selected WHEATS, now in repute, sufficient for 1 rod, with directions, &c., on receipt of seven postage stamps for each variety, enclosed with an envelope properly addressed to its destination.

THOMAS BEACH, the well known Strawberry Grower, begs to inform the public that he has now ready a large stock of fine strong plants of his true BRITISH QUEEN, the same he beat the world with at the Crystal Palace and at Chiswick, and other places up to the present season, both in flavour and weight. Plants sent to any part of the world at 5s. per 100. Post-office orders on Hounslow to Mr. Thomas Beach, Strawberry Grounds, Worton, Isleworth, Middlesex.

CUTHILL'S STRAWBERRY PLANTS.—The early and hardy BLACK PRINCE, and late PRINCE OF WALES, two celebrated sorts, will be sent out on and after August 15th. They are both enormous bearers, and either of them makes a most delicious and solid preserve, to which upwards of 300 ladies round here can testify. The Black Prince, 5s. per 100; the Prince of Wales, 7s. 6d. per 100.

J. C.'s Pamphlet on the Potato, Strawberry, Asparagus, Seakale, Rhubarb, Wine, do. Preserve, 2s.

J. C.'s Market Gardening round London, 1s. 6d. See the recommendation of it in the "Quarterly Review." Early orders requested. Post-office orders payable at Camberwell Green.

James Cuthill, Camberwell, London.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior

CINERARIAS AND CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2s. 6d., free by post.—Exeter Nursery, Exeter, Established 1720.

SPLENDID HERBACEOUS CALCEOLARIA AND SWEET WILLIAM SEEDS.

WILLIAM BARNES has now ready for sending out a small quantity of the above Seeds, the former of which is unrivalled, and has given the greatest satisfaction to all purchasers for the last four seasons, 2s. 6d. and 5s. per packet.

SWEET WILLIAMS, grown from the same stock as the seed now offered, may be seen at the present time in full bloom at his Nursery, where they are pronounced by all who have seen them to be unequalled. 1s. 6d. per packet. Payment can be made by postage stamps.

Camden Nursery, Camberwell, London.

TO GROWERS OF ORCHIDS, ETC.

MESSRS. RANGEL AND MOSER, of Rio Janeiro, beg to inform Gentlemen and others, Cultivators, and Growers of ORCHIDACEOUS PLANTS, that they have always on sale a splendid assortment of the kinds peculiar to the Brazils, and they will be happy to receive orders from parties residing in England or on the continent, which they will execute with all convenient dispatch, and at the most moderate prices. A list with prices can be forwarded. All letters (post paid) addressed to them, under cover to the Agent for H.M. Packets at Rio Janeiro, Messrs. R. & M. will furnish Plants of every description, Trees, &c.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42s. each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, John Waterer has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant blooms, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Aug. 4.

W. NICOL, Gardener, Roslyn House, Hampstead, begs to announce that his new Pea "OMAR PACHA" may now be seen in fine perfection on application to him as above.

W. Nicol being desirous to afford ocular demonstration of the surpassing qualities of his Pea, had sown at same time "Daniel O'Rourke," and all the other new Peas recommended to him this season, all of which "Omar Pacha" leaves completely in the shade. W. Nicol is now open to an offer for the whole stock.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY and GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.

Kensal Green, Harrow Road, London.

JOHN TAYLOR and SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. Overall, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

WAITHMAN'S PATENT WOVEN HOSE PIPE for LIQUID MANURE and WATER, in all sizes, from ½ inch to 3 inches diameter. Prices and samples sent free per post.—Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, London (six doors west of the Hampstead Road).

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

WARNER'S SWING WATER-BARROW (TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by

John Warner & Sons, 8, Crescent, Jewin Street, London.

(Fig. 1.)

(Fig. 2.)

J. TYLOR and SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 2 „ 15 „	„ 45 „			...	5 10
No. 3 „ 28 „	„ 45 „			...	6 18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds 8 gallons,	throws 25 feet high			...	£2 15
No. 13 „ 12 „	„ 30 „			...	3 5
No. 11 „ 16 „	„ 40 „			...	4 0
No. 12 „ 24 „	„ 43 „			...	5 0
No. 14 „ 30 „	„ 45 „			...	5 13

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1¼ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 18*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

Read's Syringe, with two roses and one jet, 19*s.*

J. Tylor & Son's Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. Tylor & Son's Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, &c.

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

COTTAM AND HALLEN, Engineers, Founders, &c.,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.
ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Aug. 4.

VINES FROM EYES.—Fine Plants of BLACK BARBAROSSA and the leading sorts in Cultivation are now in a sufficient ripeness to pack. Sorts and price upon application.—Royal Nursery, Stratford-on-Avon. August 4.

THE GEM OF THE SEASON.

GERANIUM CYDONIA CARMINIA.—This is the most beautiful variety ever sent out, either for the Conservatory or Bedding purposes: colour beautiful carmine, margin of each petal shaded with white, large truss, and abundant bloomer. Only to be seen to be admired. Now in bloom, and may be seen at the Nursery, Notting Hill.

W. Townsend will have a few strong plants, full of flower, in 8-inch pots, 1*l.* 1*s.* each; in 5-inch pots, 15*s.* each; and in 4-inch pots, 7*s.* 6*d.* each. The two first will be ready for sending out the middle of August, the young plants first week in September.—Post Office Orders to be made payable at Bayswater.

TO LOVERS OF PLANTS WITH HANDSOME FOLIAGE.

MESSRS. STANDISH and NOBLE are now sending out the fine new Greenhouse Evergreen, WEINMANNIA TRICOSPERMA, which for beauty of foliage cannot be surpassed. It was exhibited at the Royal Botanic Society's Meeting in June last, and also at the Crystal Palace. From the report of the latter exhibition, the following brief description is condensed:—"You might pass off the leaves of this beautiful plant for the fronds of a handsome Fern. They are compound and pinnate, just like Fern leaves. I do not recollect, even among Mimosas, a plant with more beautiful leaves than this." We may add that it is of good habit, and easily cultivated; and from being a native of Valdivia, it may possibly be hardy.

Strong plants, 21*s.* each.

The Advertisers have just published a new Catalogue, which will be forwarded free by post on receipt of a penny stamp.

The Nurseries, Bagshot.—Aug. 4.

NEW FUCHSIAS AND VERBENAS OF THIS SEASON AT REDUCED PRICES.

The Trade supplied.—Nursery, Hammersmith.

NEW INDIAN AZALEA, "EULALIE VAN GEERT."—This fine and distinct variety may be recommended as one of the best of this fine tribe of floricultural plants, and which has been admired by all the amateurs who saw it in bloom. It is of free growing and robust habit. The flowers of the largest are of good form and substance; colour rose and white, spotted with bright rose. Plants will be sent out next spring at 7*s.* 6*d.* and 21*s.* each, one over for every three taken; the first subscriber will, of course, obtain the best plants. Orders will also be received at my Agent's, Mr. R. Silberrad, 5, Harp Lane, Tower Street, London, from whom my Catalogue of Plants may be obtained on application.—N.B. The plants will be delivered free to London; see opinion in *Gardeners' Chronicle* of May 26th and it will be figured in the works of Messrs. Van Houtte and A. Verschaffelt of next month.

A. V. G. also begs to offer the following new and recommendable plants at reduced prices.

	s.	*d.*
Aphelandra Leopoldi	3	6
Agnostus sinuatus	5	0
Asplenium bulbiferum (Fern) per dozen	6	0

N.B. The Ghent steamer Flèche, for London, sails now regularly *vice versâ*; by this way the expense of carriage is much reduced.

A. Van Geert, Nurseryman, Ghent, Belgium.

The Gardeners' Chronicle.

SATURDAY, AUGUST 4, 1855.

It is a wonderful vegetation, that of the Himalayas, so European yet so exotic, so mean and yet so surpassingly grand. The great illustrated works of Wallich and Royle, the Sikkim Rhododendrons of Hooker, the same author's Himalayan journals, and the numerous species now decorating our gardens, have all contributed their share towards making well-informed persons familiar with the plants produced in that favoured region, where a tropical and Alpine Flora blend their forms, and Hindostan and Chinese Tartary, Burma and China intermingle, and mutually contribute to a spectacle of surpassing richness and magnificence.

Nothing, however, has hitherto been made public so well calculated to impress the mind with admiration of the Himalayan vegetation as a thin folio volume* by Dr. Hooker which has just appeared. During his residence in India the author became acquainted with the late Mr. Cathcart, a most zealous amateur, who had formed at a great cost by means of native artists, and a corps of Lepcha collectors in his pay, a very extensive series of drawings of the vegetation that surrounded him. His residence is described as a singularly beautiful spot about 1000 feet below Darjeeling and 6000 feet above the sea, occupying a mountain spur overhanging the steep forest-clad gorge of the great Runjeet river, 5000 feet below, and descending in steep jungly slopes on either hand. "Through these forests he had caused the natives to cut paths, directing all their operations with all the taste and judgment of an experienced and skilful landscape gardener. These openings led through the tangled jungle and wound amongst tall trunks of giant timber trees, which were clothed with climbing Palms, wild Vines, *Pothos*, *Hodgsonia*, and Ipomœa, and laden with masses of Orchids and Ferns, suddenly emerging on eminences commanding views of 200 miles of snowy mountains, rising range behind range in dazzling beauty, and again descending by zigzags to cascades fringed with Ferns and Mosses, and leading thence along the margins of rippling streams, overshadowed by Tree Ferns, Bamboos, and wild Plantains." Surely this must be a scene in Fairy land! In such retreats were collected the materials out of which has been made the selection of drawings now laid before the public; aided, however, by Dr. Hooker's own sketches, and reduced to an artistic form by the inimitable pencil of Mr. Fitch. Of the merit of the plates it is difficult indeed to speak too highly. Undoubtedly they are the finest that have ever yet been prepared by any English artist; nor are they in any degree inferior to the drawings of the celebrated Austrian Bauers. For this reason we observe with much satisfaction in the subscription list the "Library, Marlborough House."

The high price of the work unfortunately places it far beyond the reach of many purchasers. We shall therefore be doing our readers a real service by bringing before them a short account of such of the plants as appear to possess the greatest horticultural interest. Passing by the tropical *Hodgsonia heteroclita*, a prodigious Cucurbit, with slender climbing stems 100 feet long, and gigantic flowers, every petal of which terminates in half a dozen corkscrews exceeding the span of any man's fingers, we arrive at the following account of a hardy tree of such magnificent beauty that even the Victoria Lily is eclipsed in its presence.

Magnolia Campbellii.—This is a large forest tree abounding on the outer ranges of Sikkim, at elevations of 8—10,000 feet, appearing on the road above Pacheem, and thence ascending to the top of Sinchul 8000 feet, and Tonglo 10,000 feet; though occasionally seen on the central ranges at the same elevations, it is much less frequent. The trunk is straight, often 80 feet high, and 12 to 20 in girth, covered with black bark. The flowers are produced abundantly in April, at the end of all the branches, when the tree is as yet perfectly leafless; they vary from white to deep rose colour or utmost crimson, and *in size from* 6 *to* 10 *inches* (*in diameter*). In May the tree is in full leaf, and the fruit ripens in October, when a few small and often deformed flowers are sometimes produced. The branch represented by Mr. Fitch only bears three flowers and a bud, and yet it is with difficulty included within the space of 224 square inches.

Meconopsis Simplicifolia.—The most beautiful and conspicuous of all the Alpine flowers of Sikkim, if not of the whole Himalaya; common in rocky and gravelly places at 12,000 feet elevation and upwards, where it expands its large delicate deep violet coloured blossoms in May, exposed to the violent winds and snow-storms of those inhospitable regions. It would be a most brilliant addition to out-of-door gardens, where it "would no doubt succeed perfectly, provided it be kept damp and cool, and not exposed to too long sunshine."

Meconopsis Nipalensis.—Of this grand species we have the following account:—"This superb plant, when seen from a distance, resembles a small yellow Hollyhock. It was discovered by Dr. Wallich's collectors in Nipal, and I found it in the damp interior valleys of Sikkim, growing amidst a rank and luxuriant herbage, on the skirts of Silver Fir forests (Abies Webbiana), at 10—11,000 feet above the level of the sea. The accompanying figure is taken from a sketch of my own of a specimen that was five feet high." We need not say that the two last plants are Poppies, and no doubt cultivable without difficulty. Let the reader imagine a mass composed of the scarlet *Papaver bracteatum* or *orientale*, surrounded by the golden bells of this *Meconopsis nipalensis*, and bordered with an edging of the intensely violet *Meconopsis simplicifolia*, and he will form a picture which, for brilliancy of colouring and magnificent breadth of effect, has never yet been realised.

Decaisnea Insignis inhabits wooded valleys in the central regions of the Himalaya. Dr. Hooker first gathered it in the Lachen and Lachoong valleys, at elevations of 7000 to 8000 feet, and afterwards at Chola, where it ascends to nearly 10,000 feet.

* "Illustrations of Himalayan Plants," chiefly selected from drawings made for the late J. F. Cathcart, Esq., of the Bengal Civil Service. The descriptions and analyses by J. D. Hooker, M.D., F.R.S. The plates executed by W. H. Fitch. Folio. Reeve. 5*l.* 5*s.*

Its green flowers appear in May, and are scarcely visible amongst the leaves; the fruit on the other hand, which ripens in October, is very conspicuous and handsome, of a pale yellow colour, and full of a white juicy pulp, that is very sweet and pleasant; its fruit is eagerly sought after by the Lepchas, who call the plant "Nomorchi," and it is the "Loodooma" of the natives of Bhotan. It would appear to be a plant of very uncommon aspect, resembling a young and very slender fast grown Ash tree, among the feathery leaves of which hang clusters of great yellow fruit, somewhat resembling ram's horns. Its learned discoverer regards it as well worthy of cultivation in England for its fruit alone. "It would require protection from spring frosts, but will, no doubt, prove otherwise hardy."

Vaccinium Salignum and Serpens.—"The genus Vaccinium, which is mostly represented in northern climates by deciduous-leaved shrubs with small flowers, assumes a very different habit and appearance in the tropical mountains of both the old and new world. In the lower Eastern Himalaya, Malay Peninsula, Java, and other of the Malayan islands, especially, there is an extensive section—to which the two species here figured belong—which could hardly be recognised as having much affinity with the Whortleberry of our moors. They are all epiphytical shrubs, *having the lower part of the stem often swelling out into a prostrate trunk, as thick as the human arm or leg*, and sending out branching fibrous roots that attach it to the limb of the tree upon which it grows. These trunks are *soft and spongy internally, and are reservoirs of moisture and nutriment;* they send out a few slender, generally pendulous branches, which bear often gorgeous flowers." The two plants which give rise to the above remark are most beautiful shrubs with large crimson flowers, and would be brilliant ornaments of a greenhouse should they prove to be cultivable.

Buddleia Colvilei.—"This is very unlike any other Asiatic species of Buddleia in its size and form of flower, colour, and the locality it inhabits, its congeners being almost without exception tropical or subtropical plants; in several respects it more closely resembles some of the species of the Andes, but it *has no rival anywhere for beauty and graceful habit.* It is abundant towards the summit of Tonglo, from 9000 feet to the top 10,000 feet, and is also frequent in the Lachen and Lachoong valleys at similar elevations, even ascending to 12,000 feet. This will probably prove perfectly hardy, as I have found it in very exposed places as well as in woods; and from the abundance of its flowers, and its lasting some weeks in bloom, it would be a most desirable addition to our gardens." Let us add that the flowers are as fine as those of Escallonia macrantha, and as deep a red, while they grow in panicles as large as that of a common Lilac.

Æschynanthus Peeli, found in the thick forests where there has been no clearance, is perhaps a more brilliant red plant than any of the gorgeous species previously met with.

To these have to be added a Rhubarb (*Rheum nobile*)* of most prodigious form, resembling a giantess flounced from head to foot; an Oak (*Quercus lamellosa*) with magnificent leaves, comparable to those of the Spanish Chesnut, rendered hard and evergreen, and acorns so woody as to render riding unsafe where they have fallen in large quantities; the Sikkim Larch now in our gardens, which appears to be tender only when raised from seeds gathered at 8000 feet of elevation, but to be hardy if produced by seeds from 13,000 feet; and *Vanda Cathcarti*, a fine epiphyte, with great fleshy flowers, streaked with cinnamon-coloured bars. Such things as these point unmistakeably to the scene of a new collector's labours; and it is to be hoped that the East India Company will forthwith despatch a skilful person in search of them. The Court of Directors having liberally subscribed for thirty copies of the work, every station of importance will be certain to possess it, and therefore the natives can have no difficulty in understanding what it is they have to search for.

In the month of July, just passed, there fell 6 inches and 3-tenths of an inch of rain at Chiswick; an amount only once registered in the same month since 1797. Howard, in his "Climate of London," knew of no such rainfall in any month whatever between 1797 and 1825. Since that time we have had two similar cases. In July, 1834, there fell 6.34 inches, and in November, 1852, 6.20 inches. It is worth considering how far this striking fact is likely to influence the remainder of the season.

The average depth of rain near London may be called in round numbers 24 inches. During the year 1854 there fell so little rain that at the beginning of the present year the total amount was nearly 5 inches *below* the usual quantity. Therefore to restore the average within the year it was necessary that 1855 should furnish 29 inches. What had actually been registered at the end of last June was as follows:—January, 0.10; February, 1.35; March, 1.75; April, 0.26; May, 1.94; June, 1.48; in all 6.88 inches; but this again was 3.07 below the average: the usual fall in the first six months of the year being 9.95 inches. Hence there remained at the end of June a deficiency of rather more than 8 inches of customary rain. Now, if the last six months of the year furnish on an average 14 inches out of the usual 24, we ought to receive 22 inches between Midsummer and Christmas; in other words, there must be in the present half-year nearly as much rain as usually falls in a whole year, provided the average is to be restored before Christmas.

July usually furnishes 2.42 inches. This year it has produced 6.30 inches. The average has therefore begun to be restored, and instead of 22 inches for six months we have to look for 16.70 inches in five months, or only about $2\frac{1}{4}$ inches less than fell in all 1854.

We draw no inferences from these facts; but it must be owned that they do not encourage us to expect a dry autumn.

We understand that Mr. N. H. Mason, a young and ardent botanist, is about to visit the Azores, Madeira, and the Canary Islands for purposes of scientific research. He proposes to collect plants, insects, shells, and objects of natural history generally, and will be glad to execute commissions, either for living plants (especially Ferns) to be sent to England in Ward's cases, or for dried collections. He is well acquainted with Madeira, having resided for two years in the island, and has also visited Teneriffe. We have had an opportunity of seeing some of his dried plants, and it is not too much to say that they are among the finest that have ever been prepared; not surpassed by even those of Bourgeau. In addition to the apparatus required for collecting plants, Mr. Mason takes out a dredging apparatus for shells and zoophytes.

We have no doubt so favourable an opportunity of procuring Madeira plants, especially the numerous beautiful species of Fern will be gladly seized by our horticultural friends, who can communicate their wishes to Mr. Mason, at 17, Compton Terrace, Islington.

New Plants.

138. Leptodactylon californicum. *Hooker and Arnott in Beechey's Voyage, p. 369 t. 89; alias* Gilia californica, *Bentham in De Cand. Prodr.* ix. 316.

When this beautiful plant was shown by Messrs. Veitch at Chiswick last June, under the name of Leptodactylon californicum, we supposed that some change of tickets had occurred, so entirely did it wear the appearance of the prickly Phloxes of Siberia and North America. Since that time we have been enabled to examine its structure, and it is now necessary to announce that it really is what it has been called. The genus Leptodactylon was founded upon two North American plants, one of which Sir Wm. Hooker had previously called Phlox Hoodii, but which have been found to differ from Phlox in the ovary containing a great many ovules instead of only one or two; to which must be added the division of the leaves into linear digitate segments, instead of being entire; a circumstance easily overlooked in consequence of the divisions being carried to the very base of the leaves.

Since Leptodactylon was founded by Messrs. Hooker and Arnott, the whole order to which it belongs has been re-examined by Mr. Bentham, who reduces the genus to Gilia, calling the plant before us Gilia californica. We own to a great difficulty in believing that the alteration will be permanent, and therefore retain the name first given, which is now beginning to be known in gardens. Into the botanical question of what is to be done with Leptodactylon we cannot enter in this place.

The plant before us is one of the most charming acquisitions of Mr. Wm. Lobb, who found it on the mountains of St. Barnardino, in California, and who describes it as an evergreen shrub from 2 to 4 feet high. We have before us some of his wild specimens, which entirely bear out the statement. The wood is hard, the branches closely covered with bright, green, stiff, finely-cut leaves, and loaded with rose-coloured flowers as large as those of our common Phlox. It may be compared not inaptly to a bush of Irish Furze loaded with the blossoms of Phlox maculata, only pale and delicate rose colour instead of deep purple. We presume the species will be a hardy greenhouse or frame plant, requiring more air and dryness than heat in winter. We may add that it has all the appearance of being well suited for summer bedding out.

VEGETABLE PATHOLOGY.—No. LXXXII.

343. Capsomania.—As the organs of fructification, properly so called, are formed by the terminal spires of their own individual axis, all appendages which are superior to the normal fruit may without inconvenience be considered as repetitions of the carpellary whorls. Those cases, therefore, in which, after the formation of the proper fruit, in a more or less perfect state, the axis is still further elongated, and furnished with leaf-like appendages, may be referred to this head.

344. It has even been supposed that the columella of Mosses is capable of being so elongated, and a case is figured by Dr. Montagne, under Conomitrium Berteri, D'Orbigny Voyage, Part 2, tab. 3, which at first sight seems to indicate such a fact, but Dr. Montagne has doubtless attributed it to the true cause, namely, the germination of a spore within the capsule.

345. It is doubtful, perhaps, whether the viviparous Grasses should be referred to the same group. They are in character nearly allied to bulbs, the true fruit being entirely suppressed.

346. The axis may be elongated either after or before the formation of perfect fruit. Perfectly formed Pears, for instance, occasionally produce a leafy shoot, as in the case figured in this Journal, 1845, p. 532, and the contrary condition is illustrated in the "Theory of Horticulture," Ed. I, p. 61. Roses assume a variety of forms, according to the mode in which the organs of fructification are transformed. Illustrative figures are given in *Gard. Chron.*, 1847, p. 171; 1845, p. 291, &c., of which one of the most characteristic is here introduced.

It is this latter form which in a lower stage of development produces the green-centred Roses, which are the bane of the amateur, however instructive they may be to the botanist. Some varieties of Roses, as for instance the Ohl, Great Western, Charles Louis, &c., are far more subject to this condition than others; but the same plant does not uniformly produce green-centred Roses; in the present season they are less prevalent in my own garden and some others which I have examined than in any previous year as far as I can remember; and on one plant which has usually had many green-eyed flowers I do not find a single deformed Rose. A mode of treatment which would insure their suppression would be gratefully received, but they occur under such different circumstances that perhaps it is impossible to suggest a certain remedy, though the finest and most perfect flowers will be found in general where the soil is moderately rich, combined with a certain degree of consistency. It appears at least quite certain that highly manured land, especially if the manure be raw and contain much nitrogenous matter, has a great tendency to produce deformed flowers, even in such varieties as are not usually subject to the affection: but a dry sterile soil, deficient in all forcing nutriment, is by no means necessarily exempt. Atmospheric conditions have therefore been brought under consideration. It has been supposed that warm wet weather following a long spring drought, especially if the temperature has been unusually low, is productive of green-eyed flowers, while other authorities attribute the same effect to dry weather succeeding excessive moisture; the first supposition is in harmony with the tendency of plants to elongate their terminal buds under such circumstances, but experience does not tally with either supposition, and that of the present year, if my own observations are generally borne out, is not in favour of the first. Forcing weather in spring has in like manner been alleged as a cause, but, I believe, equally without reason. If there be any truth that nitrogenous manure is productive of

* Of this we shall give some account in an early Number.

such flowers, experiment should be made, as suggested some 14 years since by Dr. Lindley, with a view to ascertain the effect of nitrate of soda, sulphate of soda, carbonate of ammonia, and muriate of ammonia, which are said to arrest the power of extension in plants.*

347. If these green-eyed flowers are carefully examined, their condition will be found to vary greatly. In some the common receptacle of the carpels is as concave as ever, though almost every carpel is more or less perfectly transformed into a leaf, while in others it is scarcely thicker than the common stalk, and the carpels with a few exceptions, or sometimes without one, are arranged spirally round a projecting axis. In most of these cases not only is there a tendency to produce frequent spires of leaves around the axis, but to develope their axillary buds. In one now before me there is a bud in every axil, and in many cases the petals are distinctly formed though almost destitute of colour; so perfectly indeed, that a little judicious treatment might probably cause the development of a bunch of new flowers from the centre of the old, a circumstance which in some rare instances does really take place.

348. We have before mentioned this production of distinct inflorescence from the axils of bracts. It occurs not unfrequently where the leaves are multiplied beyond their normal condition. It takes place, however, constantly in certain varieties, as in the Hen and Chicken Daisy and some other Compositæ, and indeed the normal inflorescence of some species in that large order is not very different. It occurs, however, where there is no question of mere bracts, as in the curious flower of Celastrus scandens figured after Kunth in the "Theory of Horticulture," Ed. 1, p. 59. The compound Strawberry figured in *Gardeners' Chronicle*, 1845, p. 496, belongs probably to the same category. *M. J. B.*

ECONOMY OF THE GOOSEBERRY CATERPILLAR.

Last year we had no caterpillars. Our garden is separated on the east side by a high wall from that of a market gardener. Last year about this time after the young growth was made his bushes were attacked and completely cleared of leaves. He has, however, had a fair crop of fruit this year, and with it a serious visitation of the pest, clearing off all the foliage and entirely stopping the growth of the young wood. Of course he can look for no fruit next season. Early in June the easterly wind brought the fly over the wall that separates us, and the Gooseberry trees on the east side of our garden were at once affected. In searching them minutely, here and there a leaf was found with a row of small oval-shaped eggs deposited on the midrib of the lobe of each leaf, but the number was entirely insufficient to account for the prodigious appearance of caterpillars, nor could there be found any traces of emptied eggs upon the leaves where the caterpillars, even in the very smallest state, were feeding. From this we infer that the eggs we found did not produce the Gooseberry caterpillar, and that we were at fault.

At their first appearance in June we tried to destroy them with soap-suds, sulphur in dust and fumes, tobacco-water, salt and soda, warm water, and lime dust quite fresh, but all in vain; the caterpillar fed and fattened through all. But this visitation was soon at an end, so that it was with the greatest difficulty about three weeks after its first appearance that we could procure a caterpillar to experiment upon. We succeeded, however, in capturing three or four, and placed them in a small wooden bowl, covered with gauze. They were properly supplied with fresh food. Two or three died after having made an attempt at forming cocoons at the bottom of the bowl; one succeeded in doing so after the manner of the silk-worm, on the back of a leaf. It was about the size and shape of a small sugar-plum. In about three weeks the fly emerged, answering to the figure at page 500. The abortive attempts to form cocoons at the bottom of the bowl would seem to indicate a natural tendency to burrow.

About a month ago the caterpillars reappeared, and in a short time stripped the Gooseberry trees of all their leaves; they then attacked the red and white Currants, finished them, and tried the black ones, but the latter proved unpalatable. During this last attack the ground was literally alive with them, and supposing they burrowed and deposited their cocoons in the ground, we placed a quantity of suitable mould in a circular Fern tray, covered sufficiently close with a large bell-glass to prevent escape, and under this we put a considerable quantity of the pest, keeping them well supplied with fresh leaves. Here they were observed, after a while, to change colour, and in time they disappeared. The earth was then carefully spread out and searched, but nothing could we find, save their old clothes left upon the surface. We presume "Ruricola," and others of your correspondents, are satisfied that they have found their cocoons in the soil under the bushes. We have not been so successful, though we have taken up the earth to the depth of 3 inches from under one tree which was completely stripped of its foliage. In what form do the pupæ exist in the ground? Our market gardeners here have various opinions about the trees which have suffered. Some recommend destroying them at once; others say let them remain, they will recover in the second year if unattacked. One thing is clear, if the trees form their young wood before the attack they will bear the following season. If they do not, they cannot produce a crop of fruit. ☞ [We hope our entomological friends will favour us with an explanation of the facts thus described.]

* Consult *Gard. Chron.*, 1841, June 26; 1848, p. 455, and the intervening volumes.

SCENTED TEA.

(Extracted from a Communication to the Athenæum by Mr. Fortune.

"I have been making inquiries for some time past about the curious process of scenting Teas for the foreign markets; but the answers I received to my questions were so unsatisfactory, that I gave up all hopes of understanding the business until I had an opportunity of seeing and judging for myself. During a late visit to Canton I was informed the process might be seen in full operation in a Tea factory on the Island of Honan. Messrs. Walkinshaw and Thorburn, two gentlemen well acquainted with the various kinds of Teas sent annually to Europe and America, consented to accompany me to this factory, and we took with us the Chinese merchant to whom the place belonged.

"In a corner of the building there lay a large heap of Orange flowers, which filled the air with the most delicious perfume. A man was engaged in sifting them, to get out the stamens and other smaller portions of the flower. This process was necessary, in order that the flowers might be readily sifted out of the Tea after the scenting had been accomplished. The Orange flowers being fully expanded, the large petals were easily separated from the stamens and smaller ones. In 100 parts 70 per cent. were used and 30 thrown away. When the Orange is used, its flowers must be fully expanded, in order to bring out the scent; but flowers of Jasmine may be used in the bud, as they will expand and emit their fragrance during the time they are mixed with the Tea. When the flowers had been sifted over in the manner described they were ready for use. In the meantime the Tea to be scented had been carefully manipulated, and appeared perfectly dried and finished. At this stage of the process it is worthy of observing, that while the Tea was perfectly dry the Orange flowers were just as they had been gathered from the trees. Large quantities of the Tea were now mixed up with the flowers, in the proportion of 40 lbs. of flowers to 100 lbs. of Tea. This dry Tea and the undried flowers were allowed to lie mixed together for the space of 24 hours. At the end of this time the flowers were sifted out of the Tea, and by the repeated sifting and winnowing processes which the Tea had afterwards to undergo they were nearly all got rid of. Sometimes a few stray ones are left in the Tea, and may be detected even after it arrives in England. A small portion of Tea adheres to the moist flowers when they are sifted out, and this is generally given away to the poor, who pick it out with the hand.

"The flowers, at this part of the process, had impregnated the Tea leaves with a large portion of their peculiar odours, but they had also left behind them a certain portion of moisture, which it was necessary to expel. This was done by placing the Tea once more over slow charcoal fires in baskets and sieves prepared for the purpose of drying. The scent communicated by the flowers is very slight for some time, but like the fragrance peculiar to the Tea-leaf itself, comes out after being packed for a week or two. Sometimes this scenting process is repeated when the odour is not considered sufficiently strong; and the head man in the factory informed me he sometimes scented twice with Orange flowers, and once with the 'Mo-le' (Jasminum Sambac).

"The flowers of various plants are used in scenting by the Chinese, some of which are considered better than others, and some can be had at seasons when others are not procurable. I considered it of some importance to the elucidation of this subject to find out not only the Chinese names of these various plants, but also by examining the plants themselves, to be able to give each the name by which it is known to scientific men in all parts of the world. The following list was prepared with great care, and may be fully relied upon. The numbers prefixed express the relative value of each kind in the eyes of the Chinese, and the asterisks point out those which are mostly used for scenting Teas for the foreign markets:—

1. Rose, scented (Tsing moi-qui hwa).
1 or 2. Plum, double (Moi hwa).
2*. Jasminum Sambac (Mo-le hwa).
2 or 3*. Jasminum paniculatum (Sieu-hing-hwa).
4*. Aglaia odorata (Lan-hwa, or Yu-chu-lan).
5. Olea fragrans (Kwei hwa).
6*. Orange (Chang hwa).
7*. Gardenia florida (Pak-sema hwa).

"It has been frequently stated that the Chloranthus is largely used. This appears to be a mistake, originating, no doubt, in the similarity of its Chinese name to that of Aglaia odorata. The Chloranthus is called 'Chu lan'; the Aglaia 'Lan' or "Yu-chu-lan. [Yet we can positively assert that the peculiar fruit of Chloranthus, as well as its flowers, occurs in some scented Tea.]

"The different flowers which I have just named are not all used in the same proportions. Thus, of Orange flowers there are 40 lbs. to 100 lbs. of Tea; of Aglaia there are 100 lbs. to 100 lbs.; and of Jasminum Sambac there are 50 lbs. to 100 lbs. The flowers of the Sieu-hing (Jasminum paniculatum), are generally mixed with those of the Mo-le (Jasminum Sambac), in the proportion of 10 lbs. of the former to 30 lbs. of the latter, and the 40 lbs. thus produced are sufficient for 100 lbs. of Tea. The 'Kweihwa' (Olea fragrans) is used chiefly in the northern districts as a scent for a rare and expensive kind of Hyson Pekoe—a Tea which forms a most delicious and refreshing beverage when taken *à la Chinoise*, without sugar and milk. The quantity of flowers used seemed to me to be very large; and I made particular inquiries as to whether the Teas that are scented were mixed up with large quantities of unscented kinds. The Chinese unhesitatingly affirmed that such was not the case, but notwithstanding their assertions, I confess I have some doubt on this point.

"The length of time which Teas thus scented retain their scent is most remarkable. It varies, however, with the different sorts. Thus, the Olea fragrans Tea will only keep well for one year; at the end of two years it has either become scentless, or has a peculiar oily odour which is disagreeable. Teas scented with Orange blossoms and with those of the Mo-le will keep well for two or three years, and the Sieu-hing kinds for three or four years. The Aglaia retains the scent longer than any, and is said to preserve well for five or six years. The Tea scented with the Sieu-hing is said to be most esteemed by foreigners, although it is put down as second or third-rate by the Chinese.

"It appears from these investigations that many kinds of fragrant flowers besides those used by the Chinese would answer the purpose equally well, and therefore in places like India, where Tea is likely to be produced upon an extensive scale, experiments in scenting might be made with any kinds of Jasmines, Daphnes, Aurantiaceous, or other fragrant plants indigenous to the country."

Home Correspondence.

Transplanting Evergreens.—Whatever may be experienced by different parties in various localities, I conclude that it will be granted by most men who are at all conversant with the subject that autumn is the safest and consequently the best time to transplant evergreens. When I say autumn I mean the latter half of September and first half of October: so much as to time in general. Nevertheless, I would in every instance advise the operation to be modified by the exercise of a sound discretion on the part of the manager—be he gardener or not; and by his judgment of the character and quality of the soil, the state of the weather at the time, the size and condition of the plants, &c. &c., all which must be regulated by the good sense of the planter, and on the right exercise of this, success or failure will follow. Without any high pretensions, I may state that I have had some experience in planting, the result of which is, that in this, as in most other things, there are exceptions to general rules; but, on the whole, my endeavour in transplanting an evergreen would be as to time to do it early enough to let the roots get a living hold of the soil before the vital action of the plant is arrested by the approaching cold of winter. It sometimes happens that evergreens planted in spring do well. If plants and ground are in relative right condition, and the atmosphere clouded, the roots act at once, and they are safe; this is an exception: but if keen dry winds and clear sky are then prevalent, adieu to the evergreens. Many years ago somebody (I have forgotten who) wrote something plausible about the safety of transplanting deciduous trees in summer when full of leaf; to test the matter, I transplanted some Black Italian Poplars (I think six in number) in free growth, and in an open sandy meadow near the side of a river. The trees were carefully lifted, saving all their roots, which were carefully and naturally laid out in wide and not deep holes, and saturated with water (which, however, the soil would not retain) most plentifully. The result was that every one died. Could anything else have been expected? So much for listening to idle day-dreamers. I ought to have stated that the Poplars were from 15 to 20 feet in height. *Quercus.*

Erica tetralix alba.—Allow me to furnish you with a piece of this. I have grown many thousands of it, and have always considered it a variety, but it appears from the specimen sent to be a sport. *John Cattell, Westerham.* [We suppose such to be the case, since the specimen sent consists of four branches, on one of which the flowers are red, the remainder being white.]

Dioscorea Batatas.—I begin to feel convinced that what has been said in favour of this esculent as a profitable acquisition to British industry is far from being true, and that the public has been led to spend money upon an article of no practical value. Nor does there appear to be any beauty in the foliage or habit of the plant to attract attention beyond that of a Scarlet Runner. Mr. Henderson's pamphlet contains much encouragement, but theoretical plausibility does now what it ever has done—fails to satisfy a practical public. I always feel it disagreeable to impugn or throw discredit over what appears to be respectable evidence, but in this case there is no other alternative, and now let us appeal to facts. Like others I was supplied with tubers, which were placed in small pots about the beginning of April, and submitted to a temperature of 60° till the shoots had grown 5 or 6 inches in length. The plants were then removed to a cooler situation, and ultimately to a cold frame, where they remained till they were planted in the open air, which was towards the middle of June. The situation chosen for them was a south border, well drained, and at the time of planting the heat of the border at 1 foot deep was 64°. The surface was formed into ridges from 5 to 7 inches high, and upon the top of these the shoots were closely pegged down. For three weeks the plants were covered every night with large bell-glasses, and as a precaution against cutting winds throughout the day Laurel branches were placed in rows between the ridges. With all this care and close attention to other matters, the shoots do not increase in

length; they wither at the points, die off, and are succeeded from below the soil by fresh growths, which share the fate of their predecessors. The above is the result of my experience, and I know that others who have tried the plant have fared no better. *A. Cramb, Gardener to the Right Hon. Earl Ducie at Tortworth.* [It is too soon to say what it is worth, the tubers not being formed till August and September.]

Gooseberry Caterpillar.—Some years ago we were visited in this neighbourhood with a green caterpillar which destroyed every leaf on the Gooseberry bushes, but since that time we have had none, though other gardens have suffered severely. I think this arises from a practice I have since adopted every spring about February. At this time the bullfinches attack the buds of the Gooseberry and Currant bushes, and in order to prevent them I scatter over the bushes on a damp morning a plentiful dose of soot; this sticks to the buds, and being bitter, the birds will not attack them—of course a considerable portion falls to the ground, and I have no doubt kills any larva or eggs of the caterpillar that may be deposited there. The soot is sown broadcast two or three times during the early spring, and the ground is forked over soon afterwards. *Anon.*——I have tried the following experiment, which came to my knowledge through an experienced gardener, and have found it quite satisfactory. In order to get rid of the number of caterpillars that were infesting our bushes my gardener put branches of common Furze or Gorse in the middle of each bush, and in my own garden the caterpillars disappeared in two days, neither could any trace be found of them, and the remainder of the leaves are now quite healthy. *A., July* 31. [We have the same statement from "a constant reader" at Liverpool.]——Some years since, when residing near Exeter, I had a small patch of Gooseberry bushes which were so voraciously attacked by caterpillars that scarcely a leaf was left, the fruit withered, and the stalks were left bare. Having read, I believe in the *Gardeners' Chronicle*, that lime round the roots in spring was an effectual remedy, I adopted the suggestion. Before the buds came out the following spring, I took away the earth from around the stems, just uncovering the roots, and replaced it with earth well mixed with lime, some three or four spadefuls to each bush. The effect was very satisfactory, as there were very few caterpillars the following summer. I repeated the liming the next spring and rarely saw a caterpillar afterwards. *Ephra, Birkenhead.*——Observing that Mr. Manser, of Kew, had suffered severely by the Gooseberry caterpillar, I have recommended him to try a decoction of Furze (Gorse) shoots, either from a syringe or rose water-pot. It will neither injure fruit nor tree, and in our case was eminently successful, seldom having to repeat it twice, and never, that I am aware of, oftener. We saw the recipe in print several years ago, and I think in your paper. *R. Harvey, Plassey, Limerick.*——My Gooseberry trees are entirely free from caterpillars this year, whereas last year the leaves were devoured, and the crop of fruit spoiled by them. Finding myself much more fortunate than my neighbours in this respect, I attribute it to the fact of my having had the trees well washed with strong tank water (from the stable) just as the bud was bursting, and I strongly recommend all those who have suffered from the Gooseberry scourge this year, to try this plan next spring. My Currant trees present about as miserable an appearance as they did last year; but had they been dressed as the Gooseberry trees were, I have no doubt they, too, would have been free from blight and caterpillar. *Ebor, York.*——The loss of the leaves of Gooseberry bushes from caterpillars does not always seem to injure the crop of fruit the following season. Last year the bushes in my garden were actually stripped in July; there was not a leaf left, and the fruit was all spoiled. In the autumn the bushes pushed fresh leaves, and I expected to have but little fruit this year; the contrary, however, is the case, a finer or more abundant crop of Gooseberies I never saw, and the foliage is very little injured. In April vast swarms of the insects were flying over the trees, but these were all males; the females are very sluggish, and fly but little. I was not aware till I saw Mr. Westwood's remarks that the male of this insect was so little known. *Henry Doubleday, Epping.*

Page & Co.'s Blight Composition.—The answer given at p. 488, concerning the utility of this composition, is so much at variance with the results of its application in my case, that I am induced to furnish you with my experience in the matter. I have a forcing-house, heated by hot-water, which was erected expressly for early and late work; in fact, for winter forcing. Early in March last I had Cucumbers and Kidney Beans in one division, and Strawberries, &c., in another. On one side of the house—which is span-roofed—I planted my spring Cucumbers to succeed the winter ones on the other side, which were then past their best, and a good deal eaten with thrips, notwithstanding a thorough syringing twice and sometimes three times a day. The Beans were also infested, and I think about half a dozen pots out of fifty of the Strawberries had red spider on them. I procured a cask of the composition, and choosing a cloudy afternoon, I raised the temperature in the house to 85°, and shut close up. I added one part water to two of the liquid, and gave a thorough syringing. I repeated the dose three times, and my Cucumbers recovered and amply rewarded me by their luxuriant growth and a fair crop. This mixture was applied the same strength to the Strawberries, and not a spider or thrip could be seen alive. My opinion is, that unless in a close house or pit the effect is less powerful, as it seems to me that the gases evolved in its application play a prominent part in the work of destruction. I have, however, used it with certain effect on green fly on Roses and other plants, and black fly on Cherries, and I am bound to say that having taken farewell of Tobacco at 4*s.* per pound, I have failed to procure so effective and economical a substitute as that under notice. *W. Watt, Aswarby Park.* [But what of mealy bug and scale?—that is the question.]

Protecting Wall Trees in Spring.—I am aware that in the present day when a generally received opinion has been established for some time, the observations of any one who wishes to differ widely from that opinion are thought unworthy of notice; but as "W. H." (see p. 502) has just made some remarks on the subject, I have ventured to say that whilst so much attention is paid to protecting from frost, I think too little is thought of protecting from rain as well, which your correspondent's remarks appear to show is requisite, and this has been my own idea for a long time. Indeed so much importance do I attach to this, that I do not consider a wall effectually protected unless some means are employed for carrying off the moisture, though I may add that neither the want of covering from frost or rain is the only cause of blossoms not setting. I should be glad to hear from those correspondents who have not protected at all how they, as well as "W. H.," have succeeded, for if only those who were to protect by slight coverings were to have a crop, doubtless there are many who would have none at all. *J. Divers, Maidstone.*——In about a fortnight there will be a splendid show of Apricots at St. Fagan's, for all those who can and have the time to view it, or for those who are still doubting to be convinced of the efficacy of my mode of covering, a woodcut representation of which you gave at p. 373. Every admirer of fine fruit must lament that the Moorpark is very apt to gum and die off, and leave our walls sadly vacant and obliged to be renewed. A gentleman of some experience proposed in order to remedy this evil to sow the stones of the Breda and Hemskirke Apricot, and when grown up to bud these stocks with the Moorpark, in the hope of giving that plant a better constitution and a firmer stamina. It is hoped that some spirited individual will put the scheme in practice, for while the nurserymen can readily sell their deficient Moorparks, it is to be feared they will not incur the trouble and expense of making the experiment. *W. B. M. Lisle, L.L.D., St. Fagan's, Cardiff.*

Strawberries.—As a private gentleman growing the above, I always paid attention to every article in your Paper on the subject. Those articles invariably recommend that the plants should be renewed every two or three years at the most; it is laid down to be imitated as the practice of the great growers, so I have understood it. Now will you kindly explain on what principle it is stated in the Calendar last week that if a certain course is pursued, "the plants will last for several years?" Why do not the great growers pursue that course?—they do everything in the best way, you say. If it would not pay them, why pay such as me? Now, from the foregoing the question is—a great and a private grower both plant Strawberries as directed in last week's Calendar; the first destroys his for a new bed every two or three years, the latter is to make his "last for several years?" *J. W.* [The writer of the Calendar will doubtless answer this inquiry.]

Hedges.—Thorn and Privet mixed make a good fence and look well; but where there is cattle to deal with Privet is too soft, and they eat it into gaps. The best hedge I ever saw was Thorn and Holly mixed. It was either slashed or clipped every year, and a perfect specimen it was both for fencing off cattle and for shelter. *W. Hopps, Lightcliffe, Halifax.*

Larch.—How true it is that almost "everything is done by fits and starts," and that "it never rains but it pours." A few years since, when Larch poles could be had in abundance at a low price, large quantities of young Larch were planted every year; now, when the demand for rails and posts, created by railroads and inclosures, has made Larch so scarce that it cannot be procured in sufficient quantity for farmers' purposes, and it has almost doubled in price, there is hardly any planting going on, at any rate in the midland counties. In a few years no doubt the owners of land will become awake to the fact, and then perhaps the large Scotch growers will be hardly able to meet the demand, and will reap a harvest in advanced prices. Few things are more important to good farming than a good supply of fencing. *J. R. Pearson.*

Heating and Ventilating Plant-houses.—Your notice of Mr. Hood's book on ventilation, &c., reminds me of a conservatory I saw near Derby in 1803, and in which the plants were remarkably vigorous. This plant-house had been heated and ventilated by Mr. William Strutt, in conformity to his conviction that in heating and ventilating buildings, these effects should be produced by the introduction of a large body of moderately heated air. In this manner he had kept his extensive cotton mills at Belper at about the temperature of 60° Fahr., which experience had shown to be the healthiest degree of heat for operatives to work in; his dwelling-house had open fires to look at, but it was warmed and ventilated by a hot air stove in the basement, the eduction pipes of the warmed air being in the hall; in the same manner he seasoned timber, dried malt in an extensive malt house, dried the linen in his laundry, &c. The originality of Mr. Strutt's mode consisted most in his employment of a large body of moderately heated air, thus insuring perfect ventilation, uniformity of it, and that without scorching the persons or matters exposed to it. It is evident that in a plant-house, by the introduction of a large volume of air at a moderate temperature, even a current of wind might be obtained by opening the windows, or other apertures, and that without danger of scorching or chilling the plants, for air would go out instead of coming in. It has, however, occurred to me that Mr. Strutt's plan might be slightly improved upon, by causing the warm air pipe to be carried the whole length of the house, piercing the pipe with holes more or less large, according to their distance from the influx of heated air, for in this way the whole house would be equally warmed and ventilated. Of course that pipe would be carried along the side opposite to that at which were situated the windows, or other apertures to the external atmosphere. *B.*

Leaf Burning (see p. 269).—If "G. L." will mix 2 pounds of bay salt with each pail of whitewash used, it may then be applied on the outside of his glass without the least danger of its washing off. There is, however, an old saying that there is no good without an evil, the truth of which I have experienced in reference to the use of whitewash; I employed it on a stove glazed with sheet glass, 16 oz. to the foot, and it certainly prevented burning, but it obstructed heat, and next spring none of my plants bloomed so profusely as I could have wished them. *J. Gadd, Bignor Park, Petworth.*

Societies.

Botanical of Edinburgh, *June* 14.—The President in the chair. The following papers were read:—1. Remarks on the Calamite and Sternbergia of the Carboniferous Epoch, by Dr. Fleming. 2. On the Dyeing Properties of Lichens, by Dr. W. L. Lindsay. In this paper the author endeavours to direct public attention specially to the two following facts, viz., first, that in our own country many native Lichens, which grow more or less abundantly, might, with advantage and economy, be substituted for the somewhat expensive and scarce foreign Roccellas and other dye-Lichens usually employed in the manufacture of ochil, cudbear, and litmus; and, secondly, that in our colonies and foreign countries to which we have access, species valuable as dye-Lichens probably grow in abundance—might be collected and transported easily and cheaply—and thus become important and lucrative articles of commerce. He is desirous of bringing the subject under the notice of the following classes of persons or scientific bodies, to whom he leaves its practical or scientific application, viz., firstly—chemists, orchil, cudbear, and litmus manufacturers; importers and exporters of Orchella weeds and other dye-Lichens, dyers, &c.; secondly, scientific societies, such as the Royal, Geographical and Botanical, and the Society of Arts; public boards, such as the East India, Army, and Admiralty Boards; industrial exhibitions, such as the Sydenham Crystal Palace and Paris Exhibition; scientific and exploring expeditions, &c.; and, thirdly, colonists, emigrants, travellers, officers of our commercial and royal navy, and of the army and East India Company, residents abroad, and in our own Highlands and islands, &c. He remarks, "This is pre-eminently an age of discovery and enterprise in scientific matters; the strongest tendency everywhere exhibits itself to multiply the natural resources of our native country and its colonies—to turn to practical account, for the improvement of our arts and manufactures, their hitherto valueless vegetable products. The efforts at present being made to introduce the fibre of the common Nettle, Thistle, and other native weeds, in the manufacture of textile fabrics and paper, as substitutes for Flax, is only one limited example of this utilitarian tendency. Believing that this desire requires only to be led into suitable channels, my object is to submit to scientific and commercial enterprise the importance of this particular field of inquiry, and the richness of the fruits it promises. The fact that manufacturers or importers might find it economical or remunerative to be supplied with substitutes for the Roccellas, which are fast becoming scarce and consequently expensive, is the most limited view we can take of the advantages of such an investigation. Indirectly a multiplied trade in dye-Lichens might scatter the seeds of civilisation, and place the means of a comfortable subsistence at the command of the miserable inhabitants of many a barren island or coast, at present far removed from the great centres of social advancement; for the dye-Lichens will probably be found luxuriant where no other vegetation can thrive, frequently attaining their highest degree of perfection on the most bleak rocky coasts, or on elevated mountain ranges. It is probable that many rocky isles in the broad Pacific and Atlantic—many hundred miles of desolate sea-coast and vast extents of mountain districts in Africa, America, Asia, and Australasia, which at present yield no products to commerce, and are too barren to support higher vegetation, might furnish an unlimited supply of Lichens, useful in dyeing. The vast continent of India and neighbouring countries and islands, for instance, already promise valuable results in this respect. In the Indian collection of raw vegetable products exhibited in the London Crystal Palace of 1851, several specimens of "Orchella weeds" from India, Ceylon, Socotra, &c., were shown; and an explanatory note appended to some from the vicinity of Aden in Arabia stated most suggestively "Abundant, but unknown as an article of commerce." Specimens of Roccella fuciformis were there exhibited from Ceylon, estimated as worth 300*l.*,

per ton, and Parmelia perlata at 190*l.* to 225*l.* But the whole world may be said to be an open field; in every clime, in every soil, at almost every elevation, and in all seasons, tinctorial species grow, and even luxuriate. In Northern Europe, in Scandinavia, and even in our own Highlands and Islands, many such species are abundant, and might surely be collected at a rate so cheap as to render it remunerative for the manufacturer to employ our destitute Highlanders in gathering them. Moreover, in connection with the development of the economical applications of Lichens, it is not unimportant to bear in mind that many species contain such an amount of starchy matter as to become, or to furnish excellent articles of food; many are used as fodder for cattle, some are eaten in Iceland and arctic countries, and one, at least, is frequently used in the making of jellies in this country. I need only here allude, in confirmation of this statement, to the Cetraria islandica, or 'Iceland Moss' of our shops; the Gyrophora or 'tripe de roche' of the arctic regions, whereby the lives of many intrepid travellers have been preserved; the Lecanora esculenta, a kind of Manna, peculiar to the steppes of Tartary, and the Cladonia rangiferina, or familiar 'Reindeer Moss' of Lapland. On the mountains of Scotland, Ireland, and Wales, species of Lecanora, Gyrophora, Umbilicaria, and Isidium, capable of yielding fine qualities of orchil, cudbear, and litmus are more or less abundant. While the cudbear manufacture flourished in Leith and Glasgow, the Lecanora tartarea, from which it was prepared, was collected to a great extent in our Western Highlands and islands, but with the transference of this manufacture into the hands of English orchil makers, this source of remunerative employment to our poor Highlanders suddenly ceased, and this Lichen is now chiefly or wholly imported from Norway and Sweden for the London market. The value of this Lichen in Scotland is said to have averaged 10*l.* per ton. Hooker states that, at Fort Augustus in 1807, a person could gain 14*s.* per week by collecting it, estimating its market price at 3*s.* 4*d.* per stone of 22 lbs. Pennant records it as an article of commerce about Taymouth in Perthshire. Miss Roberts mentions its having been collected in North Wales at 1½*d.* per lb. for the London market; and it appears also to have been largely gathered in Derbyshire, the price there given to the collector, who could gather 20 to 30 lbs. per day, being 1*d.* per lb. The re-introduction of this trade or means of employment might be a great boon to the Highlanders, who have, within the last few years, been deprived of another source of remunerative labour and comfortable sustenance,—the collection of 'Kelp' or 'Sea-wrack' on our rocky and stormy western coasts, and whom dire necessity now compels to transfer their energies to foreign lands." He then made observations on the mode of collecting Lichens, their mode of transport, and the mode of testing the colorific value, and of evolving the colouring matters. Finally, he gave tabular views showing the chief dye-Lichens applied by the peasants of various countries to the dyeing of stockings, yarn, woollen stuffs, &c., as well as showing the chief dye-Lichens used in this and other countries in the preparation of orchil, cudbear, and litmus. 3. On Diatomaceæ found in a sub-fossil state in Dumfriesshire, by R. Harkness, Queen's College, Cork. 4. Notice of the time of flowering of certain trees and shrubs in the Royal Botanic Garden during the past month, by Mr. M'Nab.

5. Notes on the Effects of last winter upon plants in the Royal Botanic Garden, Belfast, by Dr. Dickie. The following table shows the lowest point to which the thermometer fell during the month of February, 1855. It is taken from a register kept at Queen's College, Belfast—

Min. Thermometer for February, 1855.

Date.	Min.	Date.	Min.	Date.	Min.	Date.	Min. F.
1	27.0 F.	8	31.0 F.	15	13.0 F.	22	27.0
2	30.0	9	30.0	16	19.0	23	30.0
3	30.0	10	29.0	17	20.0	24	24.4
4	33.0	11	22.0	18	17.0	25	34.0
5	39.0	12	30.0	19	21.5	26	34.0
6	36.6	13	23.0	20	22.0	27	34.0
7	37.4	14	18.0	21	27.0	28	37.4

Mean temperature for the month	Mean Maxim.	Mean Minim.	Amnt. of Rain.
32.45	37.6	27.7	1.690

It will be observed that the absolute lowest temperature was on the 15th, viz., 13° F. In 1845, on March 5th, the thermometer in the Botanic Garden indicated 10° F., lower, than in 1855. The injury to the plants, however, in 1855, was greater, because in February last a generally low temperature, with east and north-east winds, prevailed during two weeks. The following list of plants injured or killed in the Belfast Garden during last winter has been made out by the curator, Mr. Ferguson — Pinus macrophylla, much injured, 12 feet high; P. apulcensis, killed, 8 feet high; P. patula, much injured, 6 feet high; P. pseudo-Strobus, slightly injured, 7 feet high; P. Devoniana, much injured, 2½ feet high; P. Russelliana, browned; P. palustris, killed; Abies Brunoniana, killed; A. Jezoensis, killed; Cupressus funebris, north side killed; C. Lhdeana, much injured; C. elegans, killed; C. mexicana, killed; C. torulosa, one killed, and the other much injured; C. lusitanica, killed; Juniperus macrocarpa, slightly injured; Fitzroya patagonica, killed, 4 feet high; Saxegothæa conspicua, killed, 4 feet high; Cephalotaxus Fortuni, not injured in the least, whereas the large-leaved variety has suffered very much; Erica arborea, killed, 10 feet high. For the sake of comparison, it may be interesting to insert here the following report by the late Mr. Templeton, of Orangmore, respecting the severe winter of 1813-14, as reported in the "Belfast Magazine" for that year:—"Viburnum Tinus, Cistus ladaniferus, C. creticus, Erica arborea, E. australis, E. mediterranea, Ulex Europæus, the common and Portugal Laurels, in many places were killed to the ground or had their young branches destroyed. Edwardsia microphylla and Coronilla glauca which, trained against a wall, had stood the frost of several winters, are either killed to the ground, or have their branches of two or three years killed. Calycanthus præcox, Pyrus japonica, and Corchorus japonicus, have passed the winter in the open ground. Timber trees suffered greatly, especially the Oaks, which were split with great violence. Walnut, Ash, and other trees had their last year's shoots killed. The frost began in November; on December 29, the thermometer fell to 7° F." 6. Account of the origin and of some of the contents of the Museum of Economic Botany attached to the Royal Botanic Garden of Edinburgh. By Professor Balfour.

Notices of Books.

Lectures on the Comparative Anatomy and Physiology of the Invertebrate Animals. By R. Owen, F.R.S. 2d edition. 8vo, pp. 689, with numerous woodcuts.

The name of the author of this important book is an ample guarantee for its being learned, able, and conscientious. Nowhere, indeed, will the reader find the interesting facts belonging to the lower forms of animals more amply or more philosophically explained than in the pages before us. They, however, relate but in a slight degree to the subjects properly included within our own field of discussion; and we can only recommend the careful study of Professor Owen's admirable work to all who are desirous of familiarising themselves with those progressive stages of animal life which stop only when the principal nervous system occupies the centre of a bony column, vertebra, or backbone.

One point, however, namely the difference that exists between plants and animals, may arrest our attention for a moment. We need not say that the distinctions which naturalists once thought they had found, such as locomotion, nitrogenous compounds, respiration, volition, perception, spontaneous action, have one by one given way before the march of investigation, so that no one can now say that a living body is an animal and not a plant because it moves from place to place, gives out ammonia, respires carbonic acid, obeys the impulse of its will, or perceives what passes around it, and regulates its movements accordingly. These properties belong, or appear to belong, to some plants as well as to animals, or are deficient in some animals as well as in plants. But when the naturalist broke down the barriers once thought to separate the vegetable and animal kingdoms, he failed to construct others in their room, and is now compelled to avow that they pass into each other by such insensible gradations that no man can say where one begins and the other ends. Let us hear what Professor Owen has to say upon this curious topic:—

"Thus, after reviewing the different characters by which it has been attempted to distinguish the special subjects of the botanist and zoologist, we find that neither sensation and motion, the internal assimilating cavity, the respiratory products, the chemical constitution of the tissues, nor the source of nutriment, absolutely and unequivocally define the boundary between the animal and vegetable kingdoms. We can only recognise the plant or animal when a certain number of their supposed characteristics are combined together.

"An internal assimilated cavity, whether in the form of cells, canals, or bags, is essential to all. The movement of a part, when stimulated, is a property continued from the higher organised forms far down into those that manifest the combined characteristics of the vegetable kingdom, as, *e. g.*, in the *Mimosa pudica* and the *Dionæa muscipula*, as to which the statement that such movements were destined solely for the furtherance of *formative* operations, would be purely gratuitous. Locomotion also crosses the supposed line, and is an endowment of the embryos or spores of the sea-weeds. On the other hand, the rooting or fixation of the organism is continued upwards from the vegetable kingdom into the Radiate, the Articulate, and the Molluscous divisions of the animal kingdom. The cellular and cellulo-vascular forms of the assimilative cavity, common to plants and sponges, is repeated in the cestoid entozoa, the astomous polygastria, the rhizopoda, and in the early embryos of all higher animals. Tissues of binary compounds are found in polygastria and acritiæ, and the chitinous coverings of insects and crustaceans have a much closer resemblance to ligneous fibre than to proper animal tissues. The presence of starch is of itself quite inadequate as a ground of distinction, even were it proved to form part of the proper cell-walls. And on the other hand, nitrogen combines with carbon and hydrogen to constitute the chief tissues of the sponges, algæ, and fungi. These exhale carbonic acid like well-organised animals, and the polygastria exhale oxygen like typical plants.

"Thus the groups of characters that are essential to the true definition of a plant and an animal interdigitate, so to speak, in that low department of the organic world from which the two great branches rise and diverge. Every naturalist or physiologist is at liberty, of course, to adopt any one of the characters that have been supposed to divide the two kingdoms; but the boundary, so defined, will be artificial, and each different character will bisect the debateable ground in a different latitude of the organic world."

This extract is not only very interesting in itself but furnishes a good example of the philosophical spirit in which the subject is here treated through above 600 pages.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—In one of the stoves, which are now gay with Achimenes, Begonias, Orchids, &c, the new plant called Tydæa gigantea was in flower. When we say that its blossoms so much resemble those of Achimenes picta as to be scarcely distinguishable from them, some idea may be formed of what it looks like; its foliage, however, has none of those silvery markings about it which that of the last-named plant possesses. It appears to be a free flowerer, and to have the advantage of a rather more robust constitution than the Achimenes. In one of the greenhouses Platycodon chinensis was coming beautifully into flower; though hardy this well deserves a place under glass, for when in full blossom what can be handsomer, its colour and appearance forcibly reminding one of the Russell Lisianth, with which it may well be ranked. Another hardy plant in the same house worthy of notice was the well known Lilium chalcedonicum, whose waxy orange red blossoms contrasted well both in shape and colour with those of its associates. Impatiens Jerdoniæ was also here covered with showy blossoms remarkable as much for the singularity of their shape as for the brilliancy of their colour. Few plants of recent introduction promise to give more satisfaction than this Balsam.

The Rose house is again as gay as it well can be with flowers, which belong to a second crop this season, and there is every prospect of there now being abundance of blooms in it all through the autumn. The plants being clean and healthy are much admired by all who visit the garden.

In the great conservatory were beautiful examples of the blue and white Tracheliums, which though little better than annuals are very showy at this season of the year, and on that account should not be lost sight of by persons who have plant-houses to keep "dressy." The large Brugmansias have been cut "hard in," in order to keep them within bounds, and to clean them and prepare them for another crop of flowers. The Orange Cestrum is just coming freely into blossom. This we need scarcely say should be in every conservatory where there is room for it; for, when well flowered, nothing can be more ornamental. The beautiful Chrysanthemums which are so much admired in this house every year about Christmas have just been shifted out of their cutting pots into larger ones. They are grown three in a pot, and when shifted are spread out as much as possible, to make them fill the pots, and let air and light into the centre of the plants.

Among plants out of doors, annuals are now in full beauty. The more remarkable, new, or little known kinds were Iberis contracta, a lilac Candytuft, which will doubtless be a favourite; a double Sunflower, which does not rise at most above 2 feet in height; a dwarf very dark-coloured Nasturtium, a free-flowering and very handsome scarlet Alonsoa called Warsewiczi, Escholtzia tenuifolia, Messrs. Veitch's Whitlavia grandiflora, and Cacalia sonchifolia, which makes a showy bed of orange flowers.

Other novelties, in the shape of young plants raised from seeds furnished by Mr. Skinner and others, were a Rondeletia, reported to have orange and yellow flowers; a Geophila, said to bear handsome ultramarine-coloured seeds; a white Centradenia, called Skinneri; Rhexia glandulosa, a pretty plant with rose-coloured flowers; Tecoma velutina, called "Bucaro" by the natives, by whom it is much prized for its luxuriance and beauty; a Mexican Begonia, and other plants, which shall be more fully noticed hereafter. Among new trees raised from seed was an Ash from the Alma, apparently Fraxinus lentiscifolia; the Californian Plane tree, and a quantity of American Oaks of different kinds, the acorns of which were collected and presented to the Society by Mr. Frederick Rowe.

The orchard-house is every day becoming more interesting. Some of the trees have borne good crops, all have made wood satisfactorily, and are in excellent health. Some of the little Nutmeg Peaches are beginning to colour, and Fairchild's Early Nectarine is swelling rapidly. The Stanwick has also good sized

fruit on it, which as yet shows no appearance of cracking. As before remarked, Plums have thriven admirably, and are literally loaded with fruit. Smaller things, such as Black and other Currants and Gooseberries, have ripened their crops.

In the orchard, both on walls and standards, there is every appearance of plenty of fruit, and the trees this year have received no check. Strawberries have borne well. Ingram's Prince of Wales, notwithstanding the severity of the frosts in the spring, has had a good crop on it. The true old Pine has also been all that could be desired. This is still considered by many one of the best flavoured of Strawberries, and by means of top dressings of leaf-mould it will stand longer without renewal than most other kinds. Myatt's Cinquefolia is large but coarse; his Mammoth has not done well this year, probably owing to the dry weather we had in spring and early summer. For a late crop the Downton is one of the best.

The Black spined Chinese Cucumber, mentioned in our last report, has proved to be well adapted for ridges in the open air. It has a yellowish pleasant-tasted flesh, and appears to be a good bearer. The "hardy American Melon" has also set, and is swelling satisfactorily under a hand-glass. The fruit of the Australian Melon, mentioned last month, has assumed a beautiful yellow colour, but what its value may be remains to be proved.

In the kitchen garden are some excellent Peas of various kinds. If, however, we were confined to four sorts, we would choose Sangster's No. 1, *alias* Dan O'Rourke for a first crop; then Fairbeard's Champion, which is the best flavoured of all Peas, except, perhaps, Knight's Marrow. To succeed these we would take Victoria and Knight's Marrow, and if a fifth sort was wanted we would choose Dickson's Early Favourite, which appears to be so closely related to the Auvergne as to be easily mistaken for it. What has been sent to the Society under the name of the Somersetshire Pea has proved to be the Blue Prussian, and Hunt's Pea is not different from Victoria. Among Green Marrows, Bellamy's and Millford are good sorts. It may be mentioned that Green Coleworts have just been planted out to come in about Christmas. They stand about 9 inches apart every way.

FLORICULTURE.

National Floricultural Society, *July* 26.—A Certificate of Merit was awarded on this occasion to a lilac-flowered Verbena, called Eugenia, from Mr. Weatherill, of Hornsey Road. Its trusses were not very large; but the pips were of good form and substance. A similar award was also made to Petunia Hermione, from Mr. George Smith. This is of a greenish blush colour, curiously and regularly spotted and marked with light purple. The flowers are large and well formed, but rather flimsy in texture. Verbena Sir E. Lyons, from Mr. Todman, received a Label of Commendation. It is of a dull purplish colour, and in habit very like the old blue variety called Emma. Several extremely well-grown plants of what are termed Camellia Balsams were furnished by Mr. Smith, of Dulwich, and very handsome things they must be admitted to be. Among them were blush, purple, and scarlet kinds, and scarlet mottled with white, and when we state that many of the flowers measured quite 2½ inches across and an inch deep, some idea of the kind of display they made may be conceived. Their only fault was that they were scarcely sufficiently advanced in bloom. Calceolarias and cut Roses came from Mr. Cole, and Mr. Turner, of Slough, had beautiful collections of Carnations and Picotees. The last named grower had also some Dahlias and Hollyhocks.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Now that there is a profusion of flowers out of doors, it will not be possible to maintain the interest of this house, except by keeping it furnished with handsome specimens of showy plants in first-rate condition; and, with proper convenience, this is no difficult matter at this season. Nothing, therefore, should be brought here at present that is not a fair specimen, and well bloomed; nor should a single plant be allowed to remain a day here after it begins to get shabby, for it seems a waste of means, and certainly betrays bad management somewhere, to occupy glass structures with plants of inferior interest to such as are plentiful in the open air. It is not desirable in our opinion, however, to crowd the house with flowering plants, but the aim should rather be to have a moderate number of handsome specimens effectively arranged, which, while flowers are so plentiful out of doors, will be vastly more interesting and pleasing than a larger amount of floral display from plants of no individual interest or merit. This kind of display may be agreeable enough at a season when flowers are scarce, but it is useless to hope to maintain the interest of a house at this season by this kind of management. A thin arrangement of the pot specimens will also be advisable, on account of the permanent occupants of the beds or borders, which at this season should be allowed plenty of space, in order to secure strong well ripened wood; for unless this is obtained they will not bloom finely. Look over former directions, and use every means to keep insects in check, and to make order and neatness conspicuous in the arrangements of this house. Stove.—Such of the inmates here as are intended for the decoration of the conservatory in autumn and early winter should be carefully looked over, shifting such as are likely to want more pot room, without unnecessary loss of time, so as to get the pots well filled with roots before their flowering season. Also keep the shoots tied out rather thinly, and expose the plants to as much sunshine as they will bear without scorching their foliage, in order to promote stocky growth. Give clear weak liquid-manure water to young growing specimens, and report any of these that are intended to have another shift this season, so as to get the pots well filled with roots before winter. Maintain a moist growing atmosphere, and ply the syringe vigorously upon any plant at all infested with red spider.

FORCING DEPARTMENT.

Pinery.—Attend carefully to growing stock, keeping the bottom-heat regular, and the atmosphere warm and moist, and use every means to secure rapid vigorous growth. This will not be obtained, however, unless all is right at the root, therefore attend well to watering, and never allow any of the plants to become pot bound. Give air moderately to young stock, and shut up early in the afternoon, giving the plants a gentle wipe with the syringe, and the house a good steaming by wetting every available surface. Continue to pot a few suckers, as they can be obtained of sufficient strength, and do not allow too many to be produced by one plant, as they weaken each other. Indeed we never allow a sucker to grow to any size that is not likely to be wanted for stock, and unless in the case of any scarce sort, never more than two on a plant. Plants growing in beds of soil must be very carefully attended to with water, giving enough at each application to moisten the whole body of soil; for unless this is attended to, the bottom of the bed will sometimes get quite dry, while the surface is moist. Vineries.—The inside borders of houses intended to furnish a late supply of Grapes should be well soaked with manure water as soon as convenient, so as to allow of their becoming dry before the damp cloudy days of autumn set in, for damp will be most injurious then, and anything likely to cause it should be avoided. Muscats beginning to ripen should be assisted with fire heat, for it is hardly possible to ripen these properly at any season without artificial heat; and those for late use should be pushed on, so as to get them ripe by the end of next month at the latest; for those ripened later in the season are seldom of good quality, and we have always found them to hang better when ripened early in autumn than those that were ripened later in the season. Figs.—The second crop on the earliest trees will be fast advancing towards maturity; as soon as the fruit begins to ripen the atmosphere should be kept dry and rather cool, giving air freely every fine day, and using a little fire on wet cloudy days, to prevent damp and allow of a gentle circulation of air. Use every care to keep the foliage clean and healthy, and clear of insects, and do not crowd the young shoots. Melons.—Plants on which the fruit is ripening should be kept dry at the root, and freely exposed to air on fine days, avoiding moisture in the atmosphere as far as can be done without injury to the other plants. Do not allow the bottom heat to decline where the fruit is setting, which is a frequent cause of the young fruit dropping off. Keep a watchful eye on the foliage, and guard against red spider, which, if once allowed to establish itself, can hardly be removed without greatly injuring the tender foliage.

FLOWER GARDEN AND SHRUBBERIES.

Now that the effect of the present arrangement of the colours in the beds can be fairly seen, there is an excellent opportunity for noticing any mistakes, and determining upon the arrangements for next season, and this should be done without delay. When it is decided what each bed is to be occupied with next season, a plan of the garden should be made, writing the names of the plants on the beds according to the arrangement decided upon. This will be of the greatest service in showing at any time what quantity of each kind of plant has to be propagated; and unless some method of this kind is adopted, it not unusual to find at planting out time that there is a scarcity of some things and too many of others, whereas, those who have their plan to refer to can tell at a glance the exact number required of everything, and avoid mistakes in getting up too many of one thing and too few of another, and all the anxiety and confusion of working without a well defined object in view. Dahlias are growing very rapidly, and will require to be gone over frequently to keep the side branches securely tied in; for when left untied, they are readily broken off by a thunder-storm. Hollyhocks must also be securely tied to their stakes. Continue to remove dead flowers from Roses, and gave plenty of manure water to the autumn-blooming varieties. Plant out rooted cuttings of Pansies, &c., in nursery beds in a shady situation, keeping them well watered if the weather proves dry until they get established. Finish budding Roses at once, if not already done, and also get border Carnations, Picotees, and Cloves layered without farther loss of time.

FLORISTS' FLOWERS.

Take care that Carnations and Picotees do not suffer from drought. Layering may be commenced with those shoots sufficiently long. Cross breed flowers which have the desired properties; the anthers will be found low down in the calyx. The operation is a pleasing one and attended with but little difficulty. Mark seedlings, which promise well, and pull up those which are not up to the mark. Plant out Pink pipings, and put in a second crop of cuttings; these will often strike root, and make better plants than the early ones. Look over and divest of their loose skins the bulbs of Tulips. Arrange the rows of the bed so as to be ready for planting. Discard all impure flowers, whether stained in the base or on the stamens; whatever good qualities the flower may possess, these defects render it utterly worthless. Give Dahlias and Hollyhocks abundance of water; thin out the branches, and disbud the former where required, and shorten the flowering stem of the latter.

HARDY FRUIT AND KITCHEN GARDEN.

The main breadth of Spinach for furnishing the winter supply should be sown at once; also prepare ground for winter Onions. Get a good breadth of Lettuce and Endive planted out for the autumn supply, and sow some hardy sort of Lettuce for planting out against south walls, or in frames, to come in after the frost cuts off the out-door supply. Dig down exhausted plantations of Strawberries, and get the ground planted with winter stuff, if there is not already sufficient of this planted; and make a further sowing of Turnips, if these are likely to be scarce before the winter is over. Attend to cutting and drying herbs as they are ready, and do not allow Shallots to remain in the ground after the tops die down, as, in the event of wet weather, they will make fresh roots, which prevents their keeping. Get a good breadth of Cabbage planted thickly in rich ground to furnish winter greens.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 2, 1855, as observed at the Horticultural Society's Garden.

The highest temperature during the above period occurred on the 1[illegible] 1842—therm. 93 deg.; and the lowest on the 6th, 1833—therm. 36 deg.

Notices to Correspondents.

Abronia umbellata: *F K.* The time at which this flower depends upon the treatment it receives. Although hardy it does best under glass, and then flowers in the spring. It is a shy plant, and very easily lost.

Asphalte Floors: *J A.* It is not improbable that these cause your leaves to drop off if any smell remains perceptible—supposing always that no other cause can be assigned, such as a sudden exposure to unaccustomed dryness.

Budding Knife. We have received a new form of this instrument, designated "John Turner's Improved Budding Knife." Its peculiarity consists in a grooved hook for opening the bark of the stock after the usual incisions have been made. The blade is not essentially different in form from some of the [illegible] common use. The hook which is fixed at the other end of the handle resembles the curved beak of some bird: only instead of a ridge along the upper side of the curve, we have, in the instrument, a groove, narrow and shallow at the point, but wider and deeper towards the neck of the curve. No doubt by this contrivance bark may be opened a little, when the point of the instrument may be inserted, and with a steady hand drawn down the perpendicular incision. But this point cannot raise the bark on each side of the cut; the broad upper part is intended to do that. But being circular, before the broad upper part of the beak can be introduced, the point must be cut [illegible] incision about half an inch, and nearly an inch in length; the edges of the grooved part of the instrument must pass over the cambium, the delicate organisation of which must, in consequence, greatly injured. The late Mr. Knight, a most skilful budder, used no instrument to plough up the bark, if is any needed; he merely *lifted* it between the blade and the edge of his thumb; or if he did occasionally use the instrument handle of the budding knife, he still took care not to injure the bed of cambium, a precaution which does not appear to have been thought of by the makers of new budding instruments and which has most especially been forgotten in the contrivance before us.

Capers: *Tyro.* These are the flower-buds of Capparis spinosa. If you eat what are foolishly called Capers by country people here, you are very likely to poison yourself. Nasturtiums should be pickled when still soft—about half grown.

Cowslip Wine: *J R E.* Your bottles burst because the wine was not sufficiently fermented while in the cask. Wine making is an art not to be taught by recipes or precepts alone.

Peas: *J F.* There is no visible difference between your "New sugar Pea and the well known large variety that is always preferred by those who prefer stewed Peas in their pods to the English shelled and boiled Peas. We make it a point not to answer inquiries of this kind privately.—*J R.* It is impossible to name single pods of Peas—it is difficult enough to name them when growing in masses. What you have sent is some kind of green marrow.

Tank for Hot Water. Since cheapness is your object this may be constructed merely of deal well put together in the same way as the vats in which beer is set to cool.

The Crimea: *L L D.* We are not aware that the ancient Black Hellebore came from this country. It is a native of Asia Minor and the adjacent region, but appears to be quite a mountain plant. We could not find time, even if we had the ability, to answer antiquarian questions having no relation to plants; we must therefore refer you for the old history of Pontus to the classical writers. Spruner's "Atlas antiquus," Plate XXVII., gives a good map of the Crimea or Tauric Chersonese, and shows that the vallum you speak of stretched from Inkermann to Balaklava.

Yews: *E O.* You *may* cut them back now, as they are not making their growth. It would, however, be better to wait till next April. You may move them by the middle of September.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of many numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
Wm. Ingles Carne, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7l. per ton: Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 60, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.—
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. Edward Purser, Sec.
Office—40, Bridge Street, Blackfriars.

MANURES.—The following Manures are manufactured by Hodgson & Simpson, Calder Soap Works, Wakefield, and Matthews & Co., Manufacturing Agricultural Chemists, Driffield. Simpson's AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. Simpson's NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. Nesbit, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.
MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5s. per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¼ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4l. per acre and under, and he can give reference to his employers in that and in other instances.
Watford, Herts, Aug. 4.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
Incorporated by Special Act of Parliament.
Offices, 52, Parliament Street, London.
Directors.
Henry Ker Seymer, Esq., M.P., *Chairman.*
Sir John V. Shelley, Bart., M.P., *Deputy-Chairman.*
George Thomas Clark, Esq. | William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P. | Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S. | Sir S. M. Peto, Bart.
Henry Currie, Esq. | William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq. | William Wilshere, Esq.
Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.
Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. William Clifford, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected: Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland; Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable William Napier, Managing Director, 2, Old Palace Yard, Westminster.

ASCOT POULTRY SHOW, August 28, 29, and 30.—Entries close August 6th. Prize Lists may be had on application to the Secretaries.
Ascot, Surrey. Edgar Smallfield, Henry F. Wells, } Hon. Secs.

ROYAL AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

PROGRAMME OF THE NATIONAL CATTLE SHOW, and Exhibition of Stock, Horses, Sheep, Swine, Poultry, Dairy Produce, Flax, Implements, &c., open for general competition, to be held in CARLOW, on WEDNESDAY, THURSDAY, and FRIDAY, 8th, 9th, and 10th August. His Excellency the Lord Lieutenant has signified his intention to attend the Show.

Monday, 6, and Tuesday, 7.—On these days, at 7 o'clock a.m. the Judges of Implements will proceed with their inspections, when Exhibitors must be in attendance. The Show Yard will be open for receiving Cattle and other articles entered (except Horses) from 1 o'clock until 6 o'clock p.m., after which latter hour no Stock will be admitted. Special Meetings of the Council will be held on Monday, Tuesday, and Wednesday, each day at 1 o'clock p.m., in the Society's Offices in the Show Yard. The Members of the Society, Stewards, Judges, &c., will dine together in the Club House Hotel on Tuesday, at 7 o'clock p.m. Names to be sent in to the Steward of the Hotel not later than 12 o'clock noon.

Wednesday, 8.—The Judges will enter the Show Yard at 6 a.m., and commence their examination of the Stock, &c. Horses will be received into the Show Yard from 7 until 8 o'clock a.m. this day, after which latter hour none will be admitted. The Show Yard will be open to the Public from 2 o'clock until 7 o'clock p.m. Admission, 2s. 6d.; Children under 14 years, half-price. Tickets for admission will be issued at the Secretary's Office, available for the day, to Exhibitors of Stock and Agricultural Produce, for 2s. on Wednesday, and 1s. on Thursday.

The BANQUET DINNER of the Society will take place at the Railway Terminus, at half-past 6 p.m. Tickets, 10s. each, including a pint of wine—to be had of the Local Committee, or their Secretaries, at their offices, or at 24, Bachelors' Walk, Dublin, up to Saturday, 4th August. His Grace the Duke of Leinster, President of the Society, in the chair.

Thursday, 9.—The Show Yard open from 8 o'clock in the morning until 7 o'clock, p.m. Admission, 1s. No Cattle or other Articles exhibited will be allowed to be removed from the Yard till after 8 o'clock, p.m.

A BALL and SUPPER at the Railway Terminus, at 9 o'clock. Ladies' Tickets, 7s 6d.; Gentlemen's Tickets, 10s. To be had of the Local Committee and Secretaries, or 24, Bachelors' Walk, Dublin. Family Tickets to admit Three, 21s. All Tickets sold at door of Ball Room, 10s. each.

An Auction in the Show Yard at 12 o'clock, noon.

Stewards of the Yard.

Cattle (Short-horns).—William Hamilton, W. Fetherstone, H. and J. H. Macfarlane.
Cattle (Other Breeds and Mountain Sheep).—Lord Cloncurry and John Robinson Price.
Sheep.—William R. Fitzmaurice and Thomas Cook.
Swine.—H. Hans Woods and Thomas G. Mosse.
Horses.—Lord Dunlo and G. A. Boyd.
Dairy Produce and Flax.—The Hon. St. John Butler and Samuel Shane.
Poultry.—Thomas Crawford Butler and Arthur Fitzmaurice.
Implements.—The Hon. C. S. Gough, Thomas Cook, and William Hamilton.
Clerk of the Yard.—Andrew Corrigan.

By order, Thomas Harkness, Secretary.
Dublin, 42, Upper Sackville Street, July 19.

Directions.—The place for the Council and Committee Meetings, and Secretary's Offices, is at Entrance to gate of Show-yard; the Local Secretaries' Offices are in the Mechanics' Institute. Tickets for the Banquet and Ball to be obtained as above specified, and at 24, Bachelors' Walk, Dublin; and to prevent disappointment, an early application for these Tickets is requested. Exhibitors, or their Care-takers, on arrival in Carlow, must obtain Tickets for their respective entries to the Show-yard, at the Secretary's Offices, where Entrance Fees and Subscriptions will be received. All objections to decisions must be lodged with the Secretary there, in writing, before 1 o'clock on Thursday, the second day of the Show. No person can be admitted into the Show-yard until the Judges have made their adjudications.

T. H., Secretary.

The Agricultural Gazette.

SATURDAY, AUGUST 4, 1855.

The reports which reach us of the present state of the crops, and the prospects of the harvest—dated for the most part August 2d—do not indicate so much injury by the rain as we had anticipated. The Wheat midge seems to have been extraordinarily active, and more corn than usual is laid; but most of our correspondents anticipate a yield fully up to the average.

It is abundantly obvious from observation that the main source of Fertility in Soils lies in the economical management and liberal application of manure. That "Muck is the mother of meal" needs no other proof than every day agricultural observation; and the immense importations of guano; the activity of manure companies, which are every spring season brought into operation; the enormous consumption of bone dust; the increasing outcry upon the waste of town sewage; and, more than all these put together in its influence on fertility, the greatly improved management of the manure made upon the farm:—all these prove how much the improved fertility needed to feed our increasing population is dependent directly upon an increased supply of manure. Fertility is, in fact, no mere function or quality of soil; it is capable of *quantitative* estimation, and is directly due to the *quantity* of fertilising matter present. The causes of fertility in soil are all such as (1) add to the quantity of this fertilising matter, or such as (2) render it more easily and directly accessible to the roots of plants.

The fertility of such farms as Castleacre in the south, or Fenton Barns in the north, is owing not only to drainage, marling, liming, burning, processes all tending rather to the latter than the former of these objects, but to the direct importation of fertilising matter and its application to the land. "The principle adopted here is to manure for every crop." This is what the *Times* commissioner relates of Mr. Hudson's farm at Castleacre; and the enormous quantities of (1) purchased cattle food consumed and of (2) artificial manure applied are what enable this. Twenty-five shillings an acre spent upon the latter over the whole of the Turnip break (one quarter of the farm), and 200 tons of oilcake (the quantity of the former consumed upon 1200 acres of land), are illustrations of the way in which the fertility of Castleacre is maintained. And as to Fenton Barns, Mr. Hope, its tenant, has declared that except by an expenditure of 20s. per acre in guano, or other artificial manure, it could not be cultivated profitably.

Probably, however, the most extraordinary instance of artificial fertility in the kingdom maintained in this way by the continual and direct application of fertilising matter to the soil occurs in the case of Canning Park and other irrigated farms, in Ayrshire, to which the attention of our readers was directed a few months ago. We repeat in few words the substance of what was then stated.

Mr. Telfer's farm is situated close upon the shore, between it and the south line of road from Ayr. It is a plot of but 40 Scotch acres, and is a piece of the light sandy land which all along that line of coast (more especially north of Ayr) has been recently enclosed from the sandy waste in which it lay as rabbit warren. It is so light a sand as in some parts hardly to be distinguishable from the sea-sand close by it. This poor sand is made to produce the most extraordinary crops of all kinds; on one field which had been heavily clayed Mr. Telfer reaped last summer 85 bushels of Wheat per Scotch acre. The previous year had been Mangold Wurzel, and before that again the land had borne Italian Rye-grass, and had been irrigated and manured heavily for it. It is the result of this Italian Rye-grass crop that is the most extraordinary evidence of the artificial fertility conferred. The seed is sown in autumn, about 4 bushels per Scotch acre; and if sown early enough, it yields the following year four full cuttings, or between 70 and 80 tons of green food per Scotch acre. The quantity of stock kept in this way on the land is enormous. There are 48 cows kept on this farm in the neatest cow-house we ever saw; and the provision which we saw there last February for their next summer's food was 3½ acres sown down to Italian Rye-grass late the previous autumn and hardly yet up, and 3½ acres sown the previous spring, which had yielded several cuttings during the autumn. These latter 3½ acres have provided food till July, and now they will be allowed to go to seed; and the young plant of the former 3½ acres, being now fully productive, will keep the cattle on during the autumn. The treatment needed by the land, in order to yield this great produce, is extraordinarily liberal. The urine of the cows is all applied upon the land, along with about 400 tons of water per acre per annum. An inch of water is flooded on the land (by means of subterranean pipes, and the use of a long flexible pipe connecting with fixed hydrants) immediately after each cutting; but previously to this 4 cwt. of guano are sown broadcast on the land, and the water is then used to flood it into the land. About a ton of artificial manure per acre is thus employed, either 4 cwt. of mixed guano and sulphate of ammonia or 4 cwt. of nitrate of soda per Scotch acre being applied immediately after each dressing.

Here, then, is a barren sea-sand made beyond a doubt the most productive land in Great Britain; and this wonderfully liberal treatment, together with the system of Italian Rye-grass culture, is spreading in the neighbourhood of Ayr. Mr. Kennedy's land, near there, is a good soil, worth 35s. per acre. Mr. Telfer's was originally the poorest sand, Mr. Bell's is a stiff clay, Mr. Ralston's much the same as Mr. Kennedy's. It matters little what the land may be originally. The produce is extraordinary off them all, and the thing on which dependance is placed is not the natural fertility of the land, but the extraordinary supplies of food for plants that are artificially provided. Here, then, we have fertility as the result of manuring: and vegetable growth and produce are seen to be simply the result of so much raw material being provided for the living plant to act upon. An extreme case of this kind teaches what every farmer knows from ordinary experience, that upon the care with which he economises home manures, and on the liberality with which he applies imported manures, depend the produce and fertility of his farm.

Home Correspondence.

Liebig's new Principles of Agricultural Chemistry, &c.—This recent reply to Mr. Lawes' experimental papers having been approved in your columns, and fully endorsed by Dr. Gregory, the translator, I feel at liberty to offer some observations upon it; not to Liebig himself, who should be left entirely to Mr. Lawes, but

to Dr. Gregory, who will, perhaps, kindly reconcile the portions here objected to, and say how far the responsibilities may lie with the author or the translator. To Liebig we are indebted, not only for his direct discoveries, but for his very important efforts to elucidate and simplify great principles of agriculture on which our previous notions were indefinite and obscure. And if he is apt to write positively on cases which appear definite, rather from rejecting than explaining the numerous exceptions, it is not uncommon to enthusiasts, and gives value to the heavier corrective labours of men of more caution though less genius. If theory requires the knowledge of all the conditions affecting the subject (p. 6, 7), who can be a theorist? who knows all the natural laws (p. 8) affecting vegetable growth and culture? But from theory, such as we can attain, we infer yet untried practice; and it is to such inferences, not yet confirmed by experience, that the farmer objects as deceptive. Hence the R. A. S. motto, "Practice with science." Is it yet certain fact or theory that carbon in plants is assimilated from carbonic acid only, and nitrogen from only ammonia and nitric acid (p. 17)? Is it true that soil, air, water, and manure, influence the growth of plants only by their constituent parts (p. 16)? In what sense are we then to understand this of water, which acts more as a solvent than in any other way? and now the same property is awarded to ammoniacal salts; and common salt does it as well as sulphate of ammonia. Yet what can be more unlike than the manuring effects of these two salts? And are we yet in condition to affirm that other manures (even a majority of them) may not affect the growth, as well by their compound actions as by their constituent parts? Or what evidence have we, in this book, or any other, of the repeated declaration (p. 110, 115) that the diminution or increase of the crops is in (anything like) "exact proportion," to the diminution or increase of the mineral constituents conveyed to them in manure? Is it certain or theory that only exhaustion reduces the fertility of soils (p 62)? and are there not, very probably, chemical and electrical reactions amongst the soil and manure producing other benefits than mere solubility (p. 20, 21, 91)? Is the excrementitious theory of De Candolle yet absolutely disproved; and do not spores of unhealthy fungi, &c., after repeated crops, injure those following, unless duly decomposed into wholesome food? At p. 113, it is said that "principles, not recipes, are necessary;" but what is the farmer to do before the true principles are certainly ascertained, while so many "x"s (p. 80) yet remain "unknown" to us, in the vital forces and actions of vegetables and conditions of soil? And which may he safest trust for his present guidance—experiments decisive of select points, upon a select soil, such as rarely comes under his hands; or such as are deduced from extensive comparisons of the variety of soils in general use, embracing the unknown as well as the known conditions and causes of success? When all are known (if ever) recipes will be drawn from principles with delightful clearness: and for their gradual disentaglement, we owe no one hitherto so much as Liebig; but the doctrine that "the whole future of agriculture" lies in these 50 propositions (Advert. p. vii.), appears to me fitted to hinder the progress of agricultural science, by neglecting the results of often compared and corrected experience in behalf of an immature system of incomplete principles. Not that I mean to dispute their general truth or importance, nor to deny that they may be found in his previous works (except the 14th, p. 35), but how many others, different from these, may also be found there; and how many more may we yet expect, to enter by the 14th, exceptional to the preliminary postulate (p. 16), that "soil, air, water, and manure influence vegetable growth only by their constituent parts!" *J. Prideaux.*

Notes on the Culture of the Potato.—As the cultivation of the Potato is now again brought before the public in your pages in the form of an extract from Mr. Bennett's Essay, and as I see that a little discussion is expected to arise therefrom which I have no doubt will prove very useful, and perhaps instructive, amongst the agricultural community, I embrace the present opportunity of laying before you the plan I have practised in growing this useful vegetable, as well as a remark or two respecting its culture as observed amongst my neighbours, leaving all to form their own opinion upon the cultivation and produce. At the present time I am unable to say what the return has been with the produce since the visitation of the murrain, though from a report of W. H. Hyett, Esq., published in 1842, from experiments carried on on the same farm from which I now write, I find that his smallest return then under any mode practised was 85 bags of 2½ cwt. each to the acre, whilst his largest return was 117½ bags, from Jerseys. I am not going to say that we shall this year see a return at all like either of the above, but I merely mention it to give an idea of the return upon the same place previous to the disease. The soil on which my mode is practised is a light soil (stone brash on the upper oolite), in the parish of Painswick, Gloucestershire. Now for the mode of cultivation carried on. Taking Wheat stubbles as stated by Mr. Bennet, if the ground is foul, after the stubble is off, I run over the cultivator and set women to clear and burn up rubbish; if not foul I immediately set the plough to work; in this state it lies till spring, when I proceed to drag it down a little before time for planting; and again the women go over the ground to clear off all weeds that are to be seen. The ground being worked I immediately put on dung, about 12 tons to the acre, the carting and spreading being carried on at the same time, and then the plough directly follows, breaking it up as deep as we are able on this soil. After this is properly worked down, I set the marker to work running widths about 28 inches apart, after which follows close the bouting plough, which will keep four or five women alive setting at 14 inches apart in the rows, with a man to supply them with seed, and after these instead of the plough, as practised by Mr. Bennet, I set half-a-dozen men with hoes to cover up—this leaves an even surface; in this manner from 7 to 7 o'clock I can get about 3 acres planted. I plant about six bags to the acre; some plant more, the seed this year being worth 4*l.* 16*s.* per acre. Here I may remark that it is a common practice in this neighbourhood to have them put in with the breastplough, the dung being spread all over the surface previous to commencement. The man with the plough opens a trench, a woman or boy follows with the sets, the man covering up with the next run, the dung being thrown upon the top of the Potatoes; then follows another turn, and again the sets are planted—for this they pay about 10*s.* per acre; for several reasons I think this objectionable. Now for the cleaning, as soon as the Potatoes are visible all along the row, I set the horse-hoe to work, and a day or two after, as soon as the weeds worked up are dried, I set the hoes going so as to clear all along the rows; and again previous to earthing. I earth when the Potatoes have got about a foot high with the bouting plough, women following again to set all straight with their hoes; this is the last finishing until fit to dig. The price paid for digging, clearing, and pitting is about 1*l.* I have not given the price paid for labour throughout, because some can get it done much cheaper than others, that depending entirely upon the state of the land and the nature of the soil. I may here as well suggest that, for light soils, I think a marker might be made to prepare the rows for planting. *John Spriggs.*

Dairy Produce.—I believe I have had upwards of 25 oz. of butter per quart of cream, and I have often heard of "a pound a pint" during warm weather, when cows were fed on rich grass, and see no reason why the exception may not become the rule. No doubt this latter is an old story, handed down by our simple forefathers, but still it has its meaning. Let me ask three questions:—First, for example, did ever any of your readers see cream clouted by the heat of the weather?—and did they ever churn it to see what butter it yielded?—second, did ever any of those who follow the Devonshire system churn the clouts or clots separately from the thinner portion of the cream, or that imperfectly clouted, and ascertain the yield of butter therefrom; and, third, did they ever scald their milk by steam, according to M. Mabra's method of heating milk in preserving it for keeping? If not, perhaps they would oblige by trying one experiment, and giving the results in your columns. *W. B.*

Societies.

CARLISLE MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

We add to our last week's report the following farther remarks on some of the implements exhibited:—

On Stand 3 we noticed a cheap ventilator for stables invented by James D. Ferguson, of Bywell. It acts by valves for allowing the escape of vitiated air by the simple operation of pulling a cord, while at the same time, and by the same process, fresh air is admitted into the building below by air-drains and dampers, moving flush with the inside of the wall. Price (according to size) from 2*l.* to 3*l.*

Robert Tinkler's (of Penrith), barrel churn is well made and cheap. It is provided with three breakers, the first and second being to break the cream, and the third to gather the butter, which can be done from the commencement in 15 minutes; and it is so constructed as to be entirely free from all iron or other metal; and an improvement has been made in the castors and wheels, so as to diminish friction. It will churn at one time from 6 to 80 lbs. of butter. Price 4*l.*

Mr. Greening's (1 & 3, Church Gate, Manchester) combined washing and wringing machine and churn is clever. It effects by machinery the action given to the "Peggy" by the laundress, viz., a perpendicular motion at the same time as a circular one. The wringing is accomplished by rollers. When desired, the machine is readily converted into a churn by substituting a churn and churn-staff for the washing tub and "Peggy."

At Stand 7, Messrs. Reeves (Bratton, near Westbury) exhibited their improvements on Chandler's liquid manure drill. It is on the same principle as Chandler's patent, as far as regards the mixing of artificial manures with the liquid and drilling it with the seed; but instead of its being delivered by buckets, it is mixed by means of a stirrer, and flows out through the bottom of the liquid cistern. The apertures through which the liquid passes are kept open by means of steel springs fixed to the stirrers, which act as cleaners to the openings. Price 22*l.* 16*s.*

Sewell's (Longtown) roller, at stand 12, is a wooden cylinder covered with angle irons. Price 12*l.*

Boby's (Bury St. Edmunds) screen is a good one; a collar passes between each wire, rolling as the grain passes down the screen, and keeps all going and all clear.

Gilkenson's (Carlisle) churn is of barrel shape; no iron in the inside; worked well. Price 3*l.* 15*s.*

Messrs. Garrett & Son displayed their customary assortment of beautifully made implements. The prizes and commendations they receive will of itself sufficiently testify their merit; and the descriptions of several of the trials will suffice for a more lengthened notice. We highly approve their taste in making a good selection rather than bringing so far a greater number of implements.

Smith & Ashby (Stamford) have a choice selection of highly useful implements. Their celebrated haymaker has had some improvements, and their horse rake has undergone considerable alterations. Their cake breaker has undergone great improvements; the frame is now made in two sectional parts; the crushing rollers are in two parts only. The reversing of the action of the handle enables it to break for either cattle or sheep.

We were disappointed in not seeing Dussuc's steam cultivator or "machine labourer," affixed in catalogue at stand 22.

Crosskill's stand we thought larger and longer than usual. His exhibition of implements is exceedingly good, and, for the major part, we see them under varnish, and the woodwork is fully open to inspection. The mysteries of paint and putty are for once laid open to view; we give no opinion as to the utility of the change. The improvements we notice are, an additional wheel in front of the Norwegian harrow, an aid to the reversing motion applied to the haymaking machine, and the adaptation of a waggon for rough roads, by carrying most of the load on the hind wheels.

Jackson & Co.'s troughs, made of fire clay, are worthy of recommendation both as cattle and pig troughs, and very low priced.

Mr. Carson (Warminster), as usual, showed his well made chaff cutter; his safety clutch is very good and applicable. The implement requires more capacity for work.

Hornsby & Son exhibited a splendid lot of implements. Their threshing machine and cake breaker we have noticed elsewhere. Their drills kept up their well-earned reputation. We observed a comparatively trifling but important addition to the coulters of the ridge drill, whereby the mould is thrown upon guano in sufficient quantity to set aside all danger from drilling the seed too closely in contact with it. The improvement is by two upright blades being attached to the coulter iron, and working on each side the coulter track so as to mould it up. The India-rubber piping on tubes appears to possess great advantages to these drills, and we were much pleased with the easy mode of raising the pigeon-hole slides or feeding cups; it is done by a rod running the whole length of the box, supplied with small cog wheels over every slide, and by which they are raised up as required. Another improvement they have made is to raise the seed box on the side so as to qualify it for drilling hill sides with greater accuracy. This is done by two racks and pinions elevated by a screw.

There are many root-pulpers at the present Show. Garrett's consists of a pair of rollers covered with blunt teeth, attached underneath a Gardner's Turnip cutter, which has only one set of knives instead of two. One of the rollers revolves much faster than the other, and so cleans it. The machine, with two men, will reduce Turnips or Mangold to a pulp as quickly as the semi-slicer above can cut; that is, about 50 bushels an hour.

The prize pulper, by Phillips, of Brandon, Norfolk, has a shifting plate instead of the whole hopper being made to vibrate, as in the machine previously shown by this maker. It minces more efficiently than any other pulper, and tears to pieces 35 bushels per hour. The object of this machine is to introduce a more profitable method of feeding animals, by giving them minced roots mixed with straw-chaff or other chaff, or meal-bran, or Linseed or Rape-cake, instead of the old method of feeding them sometimes with roots only and sometimes with dry food only. Animals, by this mode of feeding, improve faster and at considerably less expense than by the old system. It is also particularly necessary in connection with the system recommended by the inventor of feeding animals with steam straw-chaff. This machine has been greatly simplified and rendered more efficient by the inventor, and reduced in price from 11 guineas to 6*l.* 10*s.* since its exhibition at the Lincoln Show of the Royal Agricultural Society, where it took the first prize. Price 6*l.* 10*s.*

Among the drills we observed some novelties, but did not see a single dibbling machine.

Howard's press drill (st. 91, art. 20) is a very admirable machine, in which the seed is covered by small shares which divide crest of the furrows. A most simple delivery is made by a zinc roller and brush, the level of the drill-box in no way affecting the quantity of seed sown.

Garrett's seed and manure drill, fitted with Chambers' patent distributor, is one of the most efficient of machines, the scrapers for cleaning the manure barrel being very prettily contrived.

Among clod crushers, that invented by Mr. Patterson, of Beverley, and exhibited by Mr. Palmer, of Stockton-on-Tees, claims particular notice. Its novelty consists in the use of a straight axle with eccentrics on it, thus placing each disc in a backward-and-forward position with regard to its neighbour. The eccentrics are so arranged on the shaft that their centres shall be in the same horizontal plane, or equidistant from the ground line. By this arrangement a perfect self-cleansing action is obtained, owing to the peripheries of the discs continually crossing and recrossing each other. The crushing action is greatly improved by this plan; for in consequence of the intersection of the discs at the part where they come in contact with the soil, a grinding action is exerted upon the clods, by which they are reduced to a fine mould. To insure durability the wearing part of the discs and eccentrics are chilled or case-hardened. Its peculiar form, having the side points near to the circumference of the rings (instead of being held some distance above the ground, as in Crosskill's), renders its pressing action upon Wheats more like the treading of sheep: and having plain instead of serrated rings, it has less tendency to lift the soil. Price, 30-inch discs, with travelling wheels, 18*l.*

Smith and Ashby's haymaker may still be considered the best yet made, although a rival has appeared in the machine of Mr. Nicholson, of Newark. The wheels have cast-iron knaves, each of which is boxed, and contains two spur-wheels, of internal and external gear; these work two pinions, both on the axle of the haymaker, and by sliding these pinions, without the complication of any intermediate pinion, the reversing movement is effected. The contrivance for lowering is ingenious, being merely a circular rack in which works a pinion with only two teeth or pins, which hold the rack in its place without any peg or catch being required. This machine cannot be made with double arms like Smith and Ashby's, that gives so much firmness to their fork bars, but the single hinge and spring is very neat and strong as constructed in this haymaker. By means of an extra simplicity of parts the price is unprecedentedly low.

Crosskill's clod crusher is improved by the alternate wheels being of larger size, the holes in them for the axle being of course correspondingly larger.

HORSES.

Class 1 contained stallions for agricultural purposes, foaled previously to the 1st January, 1853.

There are less entries by three in this class than at Lincoln. The first prize is carried off by Messrs. E. and M. Reed, who, with the same animal, won the second prize last year at Lincoln. This horse stands 16.3, and is Leicestershire bred. He looks quite fresh, though he has had a very heavy season; legs without a puff. The prize is deservedly awarded. Quite as deservedly is the second prize of 20*l.* awarded to Messrs. S. and R. Spencer, of Daventry, for their grey dray stallion, standing 16.2, though in some respects we could have wished him a little otherwise. He serves as a good type of the Warwick breed. Mr. Robert Brown's England's Glory, a son of the horse that carried off the 18*l.* prize at Windsor in 1851, deserves notice. He is admirably topped, and were his legs only as good, he would take a first place. He stands 16.3. His neck seems large enough to take a 3 feet collar!

Mr. Joseph Faulder, near Carlisle, exhibits a three-year old well furnished bay horse. Mr. William Wilson, of this county, shows a bony horse, but too light. His best point is the reach of hind quarters. Mr. Barthropp meets again another year in the class six others. He seems to have brought his Suffolk breed to perfection, but the perfection of the Suffolks does not seem to be the fashion, and so he goes minus prizes. As a breeder he makes a great deal of money however, and, of course, he is right in keeping to the "sort." Some of the

animals in the class have had very heavy seasons, and are not seen consequently in condition, but as a whole they are highly creditable. We never saw anything equal to Messrs. Reed's prize winner—the best conceivable legs to support the most noble top.

Class 2 (Two-year old stallions for agricultural purposes).—Mr. Robert Smith, of Ladyland, Dumfries, takes the first prize of 20*l.*, and Mr. W. Nixon, of Union Hall, Newcastle, the second of 10*l.* The award of these prizes arouses considerable discussion and difference of opinion. Some say Mr. Nixon's horse should have received the first prize. At first we confess to having been of this opinion, but upon minute inspection we concurred with the decision of the judges. Mr. Nixon's is a compact and better furnished horse, but there is more expansiveness about Mr. Smith's. One will grow, the other will not. One is nearly a hand higher than the other.

Class 3 (Agricultural stallions foaled in the year 1854).—Mr. Robert Howard proves the proverb, "those who are first shall be last," for being first—first beyond all hope of rivalry—at Lincoln, he falls at Carlisle quite into the rear. We hope he may be more successful at Chelmsford. The gentlemen who take the second prize in the first class take the first and only prize that is awarded to this, namely, 15*l.* Too much cannot be said in praise of this animal, which is nearly equal to the miracle that Mr. Howard exhibited at Lincoln. It is a light roan, with splendid black legs, standing 15.2. The chest is wide. It may be, as with animals arrived at this early maturity it at times occurs, that no further advance will be made to answer expectation. This is, of course, to be watched.

Class 4 (Mares and foals for agricultural purposes).—Mr. Bird, Penrith, takes the first prize, 20*l.*, for a splendid black mare. Magnificent hind quarters. Smaller than many in the same class, but excessively well bred, and beautifully proportioned. Our duties led us away, or we could have stayed longer to have looked and wondered. Mr. Murray, of Wigton, shows a very splendid grey mare, which receives the second prize, but the foal did not strike as as anything particular. This class contains a very creditable assortment of mares, never better either in number or quality.

Class 5 (Fillies for agricultural purposes, 2 years old). Here the first and second prizes are both borne off by one gentleman, Mr. Holland, Dumbleton Hall, Eavesham, Worcestershire. These fillies are half sisters by one horse, one red roan, the other iron grey. The one that takes the first prize is precisely the same description of animal to which the first prize in Class 3 is awarded.

Clydesdale Horses.—Those persons who have paid any attention to the draught of agricultural implements are aware that a horse naturally active, and whose natural walking pace is comparatively brisk and rapid, can plough a given extent of land with no more apparent exertion than a naturally slow-moving horse puts forth in ploughing a considerably smaller area. Hence the advantage of employing a smart-stepping team instead of a dull and heavy one; hence, again, one ground for the fame of the two very dissimilar breeds of the Suffolk-Punch and Clydesdale horses, the latter for the most part powerful animals, standing about 16 hands high, and being extremely active. They are found most extensively in the neighbourhood of the river after which they are called. There is no description of horse that appears better adapted for one-horse carts, or that can get through more work in the course of a day; and a team of Clydesdales will plough a larger breadth of ground than almost any other kind, though they require to be well fed. Their faults are a tendency to light bodies and long legs, and some of them are hot workers; the breed is susceptible of considerable improvement, in gaining greater roundness of barrel and compactness of form. The prevailing colour is black; but there are also many browns and some greys.

Class 1 (Stallion foaled previously to the 1st of January).—These horses are very admirable. Good judges, ever accustomed to the Clydesdale, assure us that the show is far from ordinary. Messrs E. & M. Reed are highly commended for a brown stallion, "Prodigy." But Mr. C. Phillips, Brompton, gains the prize 20*l.* for his grey stallion "Merry Tom," seven years old.

Class 2 (Stallions foaled in the year 1853).—To Mr. James Newbigging is awarded the 1st prize of 15*l.*

Class 3 (Mares with their foals). — Mr. James Douglass, near Drem, Haddington, received the prize of 10*l.*

Class 4 (Fillies foaled in the year 1853).—Mr. James Paterson, Langholm, Dumfries, for a brown filly of superior build takes the prize of 5*l.* Time does not admit of our doing more than barely to notice these facts, hoping upon another occasion to give a little more detailed report.

There were special prizes offered by the Carlisle Local Committee.

The 1st class (mares with foal at foot) contained 15 specimens of great beauty.

The 2d class contained four beautiful harness geldings; and in both these classes the prizes were most deservedly given to Sir Wilfred Lawson, the latter being the progeny of the former.

The 3d class (for mares for breeding hunters with foal at foot) contained 13 entries, some of which were out of place, being better adapted, in our opinion, to breed carriage horses. There were some fine old types of the true kind, pretty well past their day, with fine expansive nostril, pricking ear, and lively eye. A 13-year-old mare took the prize, the property of Mr. Swanbreck, of Sowerby. If breeders wish to study a model, let them take her for one.

In class 4 (3-year-old geldings for hunting) there are remarkable animals; and those in class 5 (3-year-old cart fillies) being so generally good that they are all commended.

Class 6 has two entries.

Class 7 has three.

We cannot treat as we would wish of those horses that have come attracted by Mr. Ferguson's special prizes. The thorough breds (Class 1) are first-rate; there are 13 entries. Class 2, coaching stallions, 14. Mr. Ferguson, of Carlisle, takes that in the first, value 40*l.*; Mr. Shaw, of York, that in the second, value 30*l.*

SHEEP.

Having omitted during the last two years our usual tabular history of the Society's sheep classes, we now resume what may be designated a synopsis of the progress of breeders and the extension of improved breeding. The first table shows the numbers of each breed exhibited at different meetings, the influence of locality upon each class, and the general increase of the Society's influence:—

Meeting.	Leicesters. Rams.	Leicesters. Pens of Ewes.	Southdowns. Rams.	Southdowns. Pens of Ewes.	Longwools. Rams.	Longwools. Pens of Ewes.	Other Breeds. Rams.	Other Breeds. Pens of Ewes.
Northampton, 1847	73	12	60	11	26	3		
York, 1848 ...	118	16	42	4	32	5		
Norwich, 1849 ...	88	14	62	17	24	5		
Exeter, 1850 ..	65	14	73	7	27	9		
Windsor, 1851...	121	15	112	20	24	5	Mountain, 13	6
Lewes, 1852 ...	48	7	74	14	12	3	Romney Marsh, 17	8
Gloucester, 1853	60	4	85	10	64	16	Shropshire, 86	17
Lincoln, 1854 ...	90	12	55	12	72	24	Lincoln, 82	6
Carlisle, 1855...	105	14	46	5	54	9	Mountain, &c. 78	19

Our next item of statistics relates to the proportion of exhibitors from the county, and those contiguous to it, in which the meeting is held, displaying the local benefit conferred by the Society, the breeding character of the district, spiritedness of the breeders, &c.

Place of Meeting.	Number of Counties represented.	Total number of Exhibitors.	Number of Exhibitors from the District of the Show.
Northampton	23	45	...
York.....	18	45	...
Norwich	16	35	...
Exeter	19	41	...
Windsor	32	65	8
Lewes	18	37	16
Gloucester ...	18	63	42
Lincoln.....	16	75	34
Carlisle	28	78	20

The following is a list of the prize men, showing how far the celebrated breeders are maintaining their ground, or yielding their honours to new competitors:—

Year.	Leicesters.	Southdowns, &c.	Long Wools.
1846	Turner, Devon	Webb, Cambs.	Large, Oxon
	Smith, Rutland	Duke of Richmond, Sussex	Handy, Gloucestershire
	Burgess, Notts	Barnard, Essex	Smith, Oxon
	Pawlett, Beds		
	Angus, Yorkshire		
1847	Pawlett	Webb	Large
	Smith	Harris, Berks	Faulkner, Oxon
	Sanday, Notts	Duke of Manchester, Hunts	Handy
		Barclay, Surrey	
1848	Borton, Yorkshire	Webb	Hewer, Gloucestershire.
	Harvey, Norfolk	Shelley, Sussex	Garne, ditto
	Hobbs, Essex	Sainsbury, Wilts	Handy
	Sanday	Drake, Hants	Large
		Duke of Richmond	Simpson, Yorksh.
1849	Abraham, Lincolnshire	Webb	Large
	Sanday	Hobbs, Essex	Garne
	Hobbs	Shelley	
	Simpson, Yorksh.	Overman, Norfolk	
1850	Abraham	Sainsbury	Hewer
	Sanday	Rigden, Sussex	Garne
		Duke of Richmond	Lane, Gloucestershire.
			Large
1851	Sanday	Webb	Garne
	Pawlett	Rigden	Lane
	Abraham		Hewer
1852	Sanday	Webb	Lane
		Earl of Chichester, Sussex	Garne
		Sainsbury	Beman, Gloucestershire
		Duke of Richmond	
1853	Sanday	Webb	Lane
	Pawlett	Lugar, Suffolk	Garne
		Rigden	Slatter, Gloucestershire
			Handy
1854	Pawlett	Lugar	Fletcher, Gloucestershire
	Borton	Duke of Richmond	Hewer
	Abraham	Sainsbury	Lane
	Walmsley, Yorkshire	Rigden	Garne
		Lord Walsingham, Norfolk.	
1855	Sanday	Rigden	Lane
	Pawlett	Earl of Chichester	Hewer
		Lugar	Garne
		Lord Walsingham	Beale, Gloucestershire

Leicesters.—*Judges:* Messrs. R. B. Aylmer, W. Torr, and J. Wright.

Class 1. Shearling rams. First prize to Mr. Sanday, a shearling, No. 228. This animal has a good back, good loin, good hand, plaits full; but has rather a defect in the flank and rump, and his leg rather too light. No. 227 (highly commended), is, in our judgment, a superior sheep; and, all things considered, better worth the prize. He has great substance, has a fine countenance, beautiful symmetry of form, a full broad chine and fore-quarter, considerable size and depth of frame, and a large quantity of good wool. Both belong to the same noted breeder, so that the turning point in the opinion of the judges is fortunately of slight consequence in this case. Second prize to Mr. Pawlett's shearling. This is a nicely formed sheep, well thrown out, and possessing besides many excellent points. Wool rather light. Mr. Pawlett's sheep generally, are characterised by their compactness of form, breadth of chine, width and fullness of fore-quarter, and good quality of mutton; their wool, however, is somewhat too straight in the staple. Mr. Beattie, of Newbie House, Annan, Dumfries, exhibits a well made shearling, with good straight back, fine bone, and good countenance. Mr. Porter, of Holmefoot, Kirklinton, Carlisle, shows an inferior animal, with considerable defects in back, neck, and leg.

Class 2. Rams of any other age. First prize to Mr Sanday, for a 52 months' old ram. This sheep has a pretty head, good neck, full chine, broad back, rather a falling off in the rump, and good wool and mutton. 2d prize also to Mr. Sanday, for a 40 months old ram. A very good sheep, with full deep chest and plaits, very firm good hand, but loin rather thinly covered. No. 372 (highly commended), is another of Mr. Sanday's extraordinary animals; beautifully shaped, and not only his fore-quarter, but his loin, rump, and twist, are exceedingly good. His mutton is very firm, and his fleece in no way deficient. Mr. Borton's sheep deserve a remark, as being very large, well formed, and most useful animals; they possess prime quality with great weight.

Class 3. Pens of five Shearling ewes.—1st and 2d prizes to Mr. Sanday. Very beautiful animals, compact and perfect in form, and all of the same looks and character. Mr. Mason, of Pallinsburn Cottage, near Wooler, Northumberland, exhibited two lots of fine ewes, but Mr. Sanday's were allowed by observers to be far ahead of any.

Short-Woolled Sheep.—*Judges:* Messrs. G. Brown, H. P. Hart, and J. Waters.

Class 1. Shearling rams. 1st prize to Mr. Rigden. This shearling is an exceedingly good sheep, having a level back, standing very wide, and possessing a good chine and breast, a wide well-covered loin, full rump, beautiful countenance, and his wool is very fine and thick set. 2d prize to the Earl of Chichester, for a shearling of remarkably beautiful form and character. His plaits and chest are very good, altogether a very fine sheep.

The Duke of Richmond, Lord Walsingham, and Mr Lugar exhibit some very beautiful and some very useful shearlings; those of the latter breeder are very large and heavy, and with plenty of wool.

Class 2. Rams of any other age. Both 1st and 2d prizes to Mr. Rigden. These sheep (the first 28 months, and the other 40 months old) are very compact, well formed, and with handsome looks. They are level on the back, have good necks, ribs well standing out, and their loins and legs are particularly good. Mr. Lugar's sheep in this class have very good frames, and fair quantity and quality of wool. Mr. E. Holland, of Dumbleton Hall, near Evesham, Worcestershire, shows a Shropshire Down, bred from the stock of Mr. Foster, and he certainly bears out the character which this breed has obtained for great size and good feeding properties combined.

Class 3. Pens of five Shearling ewes. 1st prize to Mr. Lugar, for a pen of ewes of very good quality, great frames, and handsome looks. 2d prize to Lord Walsingham, for a good lot of ewes, with very level backs, and many first-rate points of excellence. Another pen of his lordship's ewes are also commended, and from their compact frames and marks of true character, deservedly so.

Long Wools.—*Judges:* Messrs. H. Aylmer, T. B. Colton, and N. C. Stone.

Class 1. Shearling rams. 1st prize to Mr. W. Lane, for a very remarkable and noble shearling. His frame is very large; his depth very great; chest and plaits full; back, loin, and rump exceedingly good; hips uncommonly wide; fleece heavy, but not sufficiently curly. 2d prize to Mr. W. Hewer, for a very handsome sheep. He has a thick neck, good plaits, hips wide and well covered, and very good rump; wool pretty good in quality, and not deficient (for this breed of animals) in quantity. Mr. Lane and Mr. Hewer both have shearlings that are deservedly commended.

Class 2. Rams of any other age. 1st prize to Mr. Garne. This 40 months' old ram has a well-made frame; ribs well standing out, level back, broad loin, rump wide and fat, thighs full, neck large, and chest remarkably full and broad; he has a fine head, good looks, beautiful quality of mutton, and a fair amount of wool. 2d prize to Mr. Lane, for a 40 months' old ram, of great length and depth; broad full fore-quarter, and good rump and legs. Mr. Hardy, Mr. Fletcher, and Mr. Brown showed some very fine animals, but perhaps one of the best sheep was one of Mr. Garne's, which did not obtain the prize. This ram has rarely

been equalled, from beauty and proportion united to immense size, and carrying a heavy fleece of wool.

Class 3. Pens of five Shearling ewes. 1st prize to Mr. T. B. Browne. These ewes were large, well-shaped, some of them with straight backs, but they were not a level lot, and several had thin chines and deficient fore-quarters. 2d prize to Mr. Lane. These are handsomer, and more worthy the 1st prize (in our opinion) than those of Mr. Browne, which obtained that honour. They are very nicely matched; they have broad backs and loins, and fine pleasing countenances. The judges need scarcely have bestowed commendation upon the ewes belonging to Mr. Browne, Mr. Fletcher, and Lord de Mauley, as they were not at all remarkable, though good animals.

Mountain Sheep.—The class devoted to local breeds is becoming an important, as well as interesting branch of the Society's annual Exhibition.

At Lewes, in 1852, the Romney Marsh or Kentish sheep had a division of the show-yard to themselves; there were 17 rams and eight pens of ewes, valuable perhaps for their peculiar constitution, enabling them to endure the cold and fierce Channel gales, but defective in most of the points commonly allowed to denote good qualities. As far as mere size is concerned, irrespective of symmetry, there were certainly some animals among them exceeding the Leicesters, that is, as indicated by the tape-measure. At Gloucester, in 1853, were shown no less than 36 rams and 17 pens of ewes of the Shropshire breed. Visitors generally expressed their admiration at this class; and some judges were of opinion that the prize Shropshire ram had scarcely his superior in the yard for good useful qualities.

At Lincoln, last year, there were 32 rams and six pens of ewes in the class of improved Lincolns. They were remarked as being a very superior breed, possessing large frame, fine feeding quality, and unequalled quantity of wool; indeed, it was said that the prize sheep, measuring the great girth of 5 feet 8 inches, and length 4 feet 1 inch, and clipping 51¾ lbs. of wool in three years, must be one of the most valuable of long-wool animals, even though the character of frame natural to the breed is not conformable to the ideal which seems to govern judges of Gloucesters and Oxfordshires.

At Windsor, in 1851, mountain sheep were provided with a special class, mainly with a view of displaying the varieties of British sheep to the home and foreign visitors of the Great Exhibition. There were but 13 rams and six pens of ewes, including Cheviots, Exmoor Horns, Merinos, Herdwicks, Shetlands, and Spanish-and-Welch, and Merino-and-Ryland crosses. The judges to whom was confided the difficult task of singling out one breed for preference, awarded prizes to two Cheviot rams; to a pen of Cheviot, and another of Exmoor-Horn ewes.

At Carlisle we are of course in the very focus of mountain breeds; and meet here representatives of the hardy, nimble flocks scattered over the fells of Cumberland and the lofty moors of Yorkshire, Northumberland, and the Scotch border counties. They consist for the most part of the well-known Cheviot and Black-faced or Heath breeds, and of the Herdwicks—a variety not so generally known.

The Herdwick sheep are polled, and have brownish or speckled black and white or mottled faces; their wool is fine, only about the neck and fore-quarters being intermixed with kempy locks. The wool on the body is often little better than hair, but the flock-masters prefer this sort of fleece to one of better quality, as with such coats the animals can better withstand the severe winter upon the bleak mountains which are their home. The wethers will fatten without any better pasturage than they find upon the hills; and go off at 4½ to 5½ years old, weighing 10 to 12 lbs. per quarter. Their mutton possesses the very finest flavour; and consists of a larger proportion of lean meat than the flesh of any other sheep. The ewes are not put to the ram until 2½ or 3½ years old; the lambs drop about the second week in May; and are taken to the vales and lower grounds for the first winter. When at mature age they support themselves in the deepest snow blasts by scratching down to the herbage, and subsist throughout the winter without any supply of hay.

The Herdwicks are principally to be found in the central and western portions of the Cumberland Lake district; that is to say, on Langdale Pikes, in Wasdale, Eskdale, &c., extending from Windermere and Coniston to Keswick and Whitehaven; but great endeavours are being made by farmers in Westmoreland to spread the flocks of pure Herdwicks, with a view of displacing the old heath or black-faced breed.

There is a breed in the north of England, taken to the mountains in April and May and brought back to the lower grounds in November; these are not properly Herdwicks, but a cross with either the black-faced or the large white-faced sheep of the lower country.

Herdwick Mountain Sheep.—*Judges:* Messrs. W. Dodd, R. Donkin, and A. Douglas.

Class 1. Shearling rams. The prize is awarded to Mr. G. Robinson, of Orton Hall, Westmoreland, for a ram having a good level back and fair loin, still with a narrow chine.

Class 2. Rams of any other age. The prize to Mr. J. Mounsey, of Askham, near Penrith, for a 4 years and 3 months old ram. This appears to be very well shaped for the breed, but has narrow loins and flat sides; the wool of a fair quality.

Class 3. Pens of five shearling ewes. The prize to Mr. G. Robinson, for a pen of ewes which certainly match well, and have a fair form and pretty good forequarter.

Black-faced Mountain Sheep.—*Judges:* Messrs. W. Dodd, K. Donkin, and A. Douglas.

Class 1. Shearling Rams. The prize to Mr. H. Shield, of High Acton, Allendale, Northumberland. This shearling has a level back, good loin, wide chest, though the sides are too flat; the wool, also, is straight, and is hairy in quality.

Class 2. Rams of any other age. The prize to Mr. C. Summers, of Whitfield, near Haydon Bridge, Northumberland. This is certainly a pretty good sheep, having considerable length and depth, ribs standing pretty well out, but the wool not a very good sort.

Class 3. Pens of five Shearling ewes. The prize to Mr. J. Brydon, of Moodlaw, near Langholm, Dumfries, for a pen of well formed ewes, high standing, and having good fleeces of wool.

Cheviot Sheep. (Shown for special prizes offered by the Carlisle Committee.) *Judges:* Messrs. W. Dodd, R. Donkin, and A. Douglas.

Class 1. Rams not more than four shear. 1st prize to Mr. T. Elliot, of Hindhope, near Jedburgh, Roxburghshire, for a 38 months' old ram; a very good animal indeed; with thick neck, good chine, good shoulders and chest, wool plentiful and of good quality; 2d prize to Mr. T. C. Borthwick, of Hopsrig, near Langholme, Dumfries, for a 3 years and 3 months old ram; a large sheep, but rather better in the rump and loin than in the fore-quarter and neck. Mr. Elliot's ram, and also that shown by Mr. W. Aitchison, of Linhope, near Hawick, N. B., are highly commended; the latter of great size, though hardly so good in form as many others.

Class 2. Shearling rams. 1st prize to Mr. Elliot, for a ram having a straight back and good rump, but a long narrow frame, though good wool. 2d prize to Mr. Borthwick, for a pretty good animal. Mr. Elliot and Mr. Aitchison are both fortunate enough to obtain high commendations in this class also. Both these rams have good level backs, long though tolerably broad frames, and good fleeces.

Class 3. Pens of five ewes, of not more than 4 shear. The prize is given to Mr. Borthwick, who indeed is the sole competitor in this class. These ewes are large and of very good quality, with fine looks, and pretty good wool.

Class 4. Pens of five shearling ewes or gimmers. The prize to Mr. Elliot, though eight competitors showed against him. These are large and good ewes, with great frames and good looks.

PIGS.

Class 1. Boars of a large breed. The first prize boar, "Young Hector," the property of Mr. Horsfall, of Burley Hall, Yorkshire, is an exceedingly good animal, not possessed of very large frame, but rather short, scarcely exceeding 2 yards in length to the root of the tail. He is remarkable, however, for his good proportions, thick, deep carcass, and fair quality. In this case, the judges have wisely chosen an animal of use to breeders, and not with all the defects obscured by overfeeding. The second prize boar, shown by Mr. Charles Jackson, of York, is another suitably-fed animal, having an immense neck-chine, great thickness of frame, full thick hams, a covering of long hair, and short fine ears. No. 561, a remarkably good animal—large and symmetrical, with slender bone and fine quality of flesh, had been entered in the wrong class, being undoubtedly of small breed character, hence he was disqualified for competition.

Class 2. Boars of a small breed. Mr. Hatton, of Addingham, Yorkshire, takes the prize for a wonderful boar, under two years old, yet of extraordinary girth, depth, and width; having a very level broad back, beautiful quality, and fine snout and ears, and every point denoting a well-bred and quickly-feeding animal. The second prize goes to Mr. Turner, of Barton, Devonshire, for a black boar of beautifully fine quality. This pig is well formed, round, full and smooth in all points, but not excessively fat. A boar, bred and exhibited by Mr. Watson, of Bolton Park, Cumberland, struck us as being surprisingly forward for his age, which is only 7½ months; yet he displays the compactness of form and enlarged frame of a maturer animal.

Class 3. Breeding sows of a large breed. The prize sow belongs to Mr. Harrison, of Heaton Norris, near Stockport, and certainly she is an astonishing animal; of immense length and proportionate breadth, high-standing, yet with deep trailing belly; thick hams, full chine, and with all this largeness of dimensions and weight of carcass, having wonderfully small fine bone. A great sow, belonging to Mr. Horsfall, but much older than the above, well deserves the high commendation she received. Mr. Wainman's, of Carhead Grove Hill, near Leeds, was commended, but in our opinion was much too fat. No. 590, bred by Mr. Farish, of Dormanstead, Carlisle, was also commended; a long, level backed sow, with seven very fine pigs. No. 603, belonging to Mr. Taylor, of Oatlands, Leeds, is a large sow, not made up to an extravagant degree of fatness, having notwithstanding a remarkably good neck chine, though somewhat deficient in the hind quarters.

Class 4. Breeding sows of a small breed.—The prize sow, exhibited by Mr. Watson, was too fat, not of very great size, but straight, broad, of great girth and depth. A beautiful black sow, of Mr. Turner, was highly commended; also, Mr. Horsfall's sow, No. 625, a thick, level, well formed animal, of beautiful quality, with two fine pigs. No. 614, bred by Mr. Mangles, of Giverdale, Ripon, Yorkshire, was commended, a small short sow, round and fat, of good feeding properties. The sow shown by Mr. Hayward, of Folkington, Sussex, was also commended. It had a straight back, thick, deep frame, fine quality, light offal, and was very fat, indeed a remarkable animal for her age, which is only [illegible] months. A sow, bred by Mr. Hayward, and exhibited by Mr. Jupson, of Staveley, Westmoreland, was specially commended;" a remarkably well made sow, with wonderfully good neck chine, level back, and especially broad frame.

Class 5. Three breeding sow pigs of a large breed.—Mr. Sadler, of Bentham Purton, Swindon, takes the prize for a black and white sow pig, of beautiful symmetry, level, round, not too fat, with fine bone, and fine black hair, and these are three very uncommon animals. No. 632, a pen of the improved Yorkshire breed, bred and shown by Mr. Wainman, is highly commended, in our opinion, whatever may be the merits of the breed itself, these individual animals possess little claim to the honour, beyond the unfattened and natural condition in which they are exhibited.

Class 6. Three breeding sows of a small breed.—The prize pen belongs to Mr. Watson, and the three sow pigs (Faith, Hope, and Charity!) are broad, well shaped, fine, and extraordinarily fat. The sow pigs of Mr. Brown, of The Height, Wigton, Cumberland, were highly commended; they are short, small, and of beautiful quality.

It is worth while noting, in conclusion, that two arrivals of small breed character have been disqualified by the judges for having been entered in the large breed classes. And no less than four have been disqualified because their state of dentition indicated *over age*.

POULTRY.

The entries at Lincoln were 295; at Carlisle they are 185, which is a falling off.

The following table may in some sort be an index to popular feeling with respect to the various breeds:—

	Spanish.	Dorking.	Cochin.	Malay.	Game.	Hamburghs.	Polish.
Lincoln	13	72	50	3	34	47	9
Carlisle	17	51	15	3	39	27	9

The Cochin has had his day; the Dorking maintains his ground as the most valuable breed we possess, and the Game fowl seems to be much esteemed. The show of Dorkings was especially good—we refer to quality. The Ducks were fair, and the Geese below par.

The following is an attempt at a translation of the speech of the Baron Ricasoli, at the Pavilion Dinner of the Carlisle Meeting last week. To do justice to the beauty of the original is impossible. *C. W. H.*

It grieves me much that I cannot make use of your language gentlemen, in order to express in a manner that all might understand the sentiments of my heart and the thoughts of my mind. I am not sufficiently accustomed to your language to be able to make use of it in an extempore speech suitable to this joyful and honourable occasion. There are circumstances in which a man feels strongly the necessity of making all who hear him fully understand all that he feels and all that he thinks. The present is such an occasion for me, in which I would wish to tell you the deep impressions which my sojourn amongst you, although brief, has conveyed to my mind. Your language, therefore, being of no avail to me, I will speak in my own tongue, whose well-known beauty and richness are fully adequate to paint the heart's best feelings and the mind's best thoughts. The English are travellers, and many languages are familiar to them. Often have I heard Italian pronounced by English lips, and not seldom, I must say, has that language received a new grace from the purity with which it was spoken. I am confident therefore that in this numerous assembly there are many who will understand my words, and that they again will be my kind interpreters to the rest. It has fallen to my lot to-day to enjoy the honour of representing in the assembly here convened the Italian nation, and from being myself a native of one of its most cultivated and fertile provinces, well known to Englishmen, my case is rendered the more apposite, and the office confided to me more agreeable. I return my thanks to the illustrious president, whose kindness has procured for me a seat in the midst of you. I beg also to thank the stewards, members of Council, the secretary, and others, who on becoming acquainted with my wishes, and the object of my journey, have taken every pains to enable me to see and thoroughly examine all the machines and the stock which has been collected for trial in Carlisle. I also heartily thank all those who, from the moment when I first set foot on English land, have with generous hospitality, at once noble and wise, opened to me the way to this great meeting, and have also enabled me to learn what treasures of political, civil, and domestic life are gathered together in this noble country; so that having arrived in London on a short visit to some valued friends, when I think that five weeks have passed, and that my departure is near, I derive consolation from the hope that I have gathered much instruction and drawn many useful lessons from my short sojourn in your country. If it be true that, in order to know and appreciate a nation, a lengthened sojourn in it is not so necessary as to see its internal organisation, it is more true with respect to England than any other nation, because the primal law of her being lies in her customs and habits, to which her institutions and laws are accommodated with the most harmonious wisdom. The first condition of happiness lies in this; it is but a foolish pretension and a great misfortune if a nation endeavours, by institutions and laws, to give itself new customs, or to change them before the already changed custom imperiously demands it. Since custom is a composite result of the sentiments, the thoughts, and the habits which surround and penetrate life, constituting the national character, which never changes, and only in some places and very slowly even modifies itself—for this reason I believe there is no state more solidly constituted than the English nation; and none more adapted for development, Moral, Civil, and Political, those three phases of human life which must be jointly fulfilled in order that the ends of all true policy may be carried out. It is simply because I think thus that I utter these words; I could not stoop to flatter a people I so much esteem and honour.

Now it appears to me that one of the most prominent of your national customs is the way in which you treat agriculture. This is a great fact of which we will rapidly run through the most leading points. Here, agriculture is not only a science and an art, but the practice of life, a means not only for developing

material wealth, but also, and still more, for developing the moral condition. Honoured by all, it renders honourable all who make it their profession and their delight. Happy, in truth, do I hold that country to be where such a state of things comes to pass, because it reveals great qualities in the people who inhabit it. I do not look to the money which is spent in improving farms, but I do look to the eminent qualities which the practice of agriculture demands—Morality, Perseverance, and true Intelligence. When I see agriculture favoured alike by the small farmer and the noble lord; when I see Earls, Marquises, and Dukes assembled here to consider attentively the affairs of agriculture—distinguishing themselves by letting their own names figure on the best machines; when I think of the life which is spent in the lordly castles of England a great part of the year in improving the land and educating the people by precept, by example, as well as by munificence, a spontaneous feeling and thought induces me to exclaim, "Happy, happy is that country where the best example comes from the highest classes, where it is the custom to honour and to cherish agriculture, and to make it the source of pious and gentle pleasures, and the means of social and moral training." That husbandry is here pursued as an art and a means of pleasurable wealth with success, as well as perseverance and energy, let this great meeting witness—it is witnessed by the variety and quality of the animals—it is witnessed by the collection of agricultural machines, which from the simple scythe or rake rises to the threshing and the reaping machine, so that no part of farm work is left uncared for, but each may find the instrument best adapted to fulfil its purpose in the best manner and at the least expense. If time and language sufficed me I could tell how agriculture thus practised leads a nation to the most perfect results; but it is sufficient now to recall to the minds of my hearers that the greatest example of modern civilisation has been given to the world by the English nation, when it broke through the ancient walls of prejudice and jealousy, and gathered together in its bosom in the year 1851 all the nations of the world; proclaiming with a voice at once Christian and politic that hatreds and jealousies and rivalries were at an end: and that justice being the basis of all international relations, all were equally interested in emulation for the highest ends. This fact, I will not disguise, is the sign of a new epoch in the history of humanity; from that day the political world received new conditions, which the future will yet unfold. These praises of English agriculture may well come from one who was born on the soil of Tuscany. My country and yours, gentlemen, I may add, in the words of your illustrious president, are united in one common bond of sympathy in an alliance which nothing will dissever, and which I trust the circumstances of the future will render still more solid and close. Allow me, gentlemen, to close my speech by proposing the toast which is the expression of my warmest feelings:—"Health and prosperity to you who honour agriculture as the source of virtue and of wealth, and who pursue it with so much ardour and intelligence; health and prosperity to the noble English nation who first rose in the field against the errors of political egotism and immorality, and set the world an example of liberal and Christian policy!"

Monthly Council, *August* 1.—Colonel Challoner, trustee, in the chair. Twenty-five new members were elected.

Finances.—Mr. Raymond Barker, chairman of the Finance Committee, laid before the Council the monthly report on the accounts of the Society, from which it appeared that the current cash-balance in the London bankers' hands was 2,697*l.*

Mr. Pusey.—Lord Portman communicated to the Council his intention of moving, at the Monthly Council in December, the consideration of the best means by which the Society may express and record its deep sense of the value of the late Mr. Pusey's services, in promoting its objects, and the general advancement of English agriculture.

Implement Trials.—Mr. Fisher Hobbs, Senior Steward of the Implement Department at Carlisle, reported most favourably of the recent exhibition and trial of implements. He thought it also a strong fact that he had on that occasion no protest to present to the council against any of the awards made at Carlisle. He had several suggestions to offer on his own part, as well as on the part of the exhibitors, in reference to the exhibition and trial next year at Chelmsford. These he intended to lay before the Council in November, when they would no doubt be referred as usual to the consideration of the Implement Committee of the Society.

Foreign Stock and Implements.—Mr. Fisher Hobbs took that opportunity of stating that when the Council again assembled after the autumn vacation, he should move the following resolution:—"That special prizes be offered at the Chelmsford Meeting for the live stock and agricultural implements of foreign countries."

Veterinary Inspection.—Professor Simonds reported to the Council the result of his professional inspection of the animals exhibited in the Society's showyard at Carlisle. Amoug these animals, especially in the classes of pigs, several animals were satisfactorily ascertained to be considerably above the ages at which they had been entered for competition; and so gross and palpable were some of these cases, that the Council referred the whole details to the stewards of the yard, with a request for their general report on the subject in November next, in order that the Council might determine in what manner these erroneous certificates ought to be dealt with.

Chelmsford Meeting.—A General Chelmsford Committee, for the country business of next year, was appointed.

Adjournment.—The Council then adjourned over the autumn vacation, to Wednesday, the 7th of November.

MR MECHI'S ANNUAL GATHERING.

On Saturday about 400 gentlemen interested in the success of agriculture assembled, according to custom, at Mr. Mechi's Model Farm at Tiptree Heath, Essex, and had the opportunity of witnessing what can be done by a liberal expenditure of capital, followed up by unturing energy and zeal. A few years since and the spot which now marks this farm was a heath, hardly capable of producing a blade of nourishing Grass. Mr. Mechi, finding his land of the poorest description, set to work in earnest, and in a short time had his farm thoroughly drained, the hedges knocked down, the land added to his fields, and nearly every tree stubbed up. All this has, however, not been done at once. Mr. Mechi has had much to contend with, as will be seen from a lecture he recently gave, when he said, "Vainly did I try by solid manures to render this vile plastic clay into a useful pasture. It was like bird-lime in winter and cast-iron in summer; poor, indigenous, and drab-coloured Grasses choked and eradicated the finer kinds I had sown, and the animals wandered about hollow and dissatisfied. Now fine and fattening Grasses clothe the field with perpetual verdure, and it keeps three times as many animals, and the close and shaven pasture indicates their affection for it." The manure which is used at Tiptree is liquified, and underground pipes are laid throughout the farm, with plugs at intervals for the hose to be placed in and the manure distributed.

Shortly after the bulk of the company had arrived, they proceeded with Mr. Mechi to view the farm and stock. The Wheat, Barley, and Oat crops are all that could be wished, and the Mangold Wurzel and other root crops seemed to be in excellent condition. If one could be permitted to form an estimate applying to the county at large from Mr. Mechi's farm, we are promised a most abundant harvest. The cattle, pigs, sheep, and other live stock were healthy, and clean. But his stock is reduced in quantity; and as bad times found him adventurous, good times and high prices induce him to realise.

Not the least attractive part of the day's proceedings was the exhibition of new agricultural implements. A machine for thinning root crops, very simple in its construction, was pronounced successful. A ponderous machine, the invention of the Earl of Dundonald, for cutting up the ground and putting down pipes for draining purposes, also attracted some share of attention. Hussey's reaping machine, as made by Dray & Co., was tried upon some Wheat, a portion of which was very much laid, and the result was so satisfactory that several orders were given on the spot. The principal alterations made in its construction are the skeleton blade and the tilting platform—subjects of two separate patents. The knives are made to assume an outline instead of a solid form; this not only affords an egress for the rubbish, but having four cutting edges instead of two, it completely minces any weedy material which would otherwise hang to it; and thus renders choking or clogging an impossibility.

Messrs. Dray & Co. also exhibited an improved Grass and grain separator, which is referred to in our report of Carlisle.

The inspection of the crops and farmyards over, the company repaired to a large marquee, and partook of a cold collation. Mr. Mechi presided, and was supported on his right by the Lord Mayor, and on his left by the Marquis of Drogheda. Among the company present we noticed the Earl of Essex, Mr. D. Waddington, M.P., Mr. Bass, M.P., Mr. Apsley Pellatt, M.P., &c. &c. The usual loyal and constitutional toasts having been received with enthusiasm, the chairman proposed the "Bishop and Clergy of the Diocese, coupling with it the name of the Rev. Mr. Sidney." (Cheers.)

The Rev. E. Sidney in reply said, that when a few years ago he held an appointment in the county of Norfolk, and was then surrounded with a number of practical farmers, he first turned his attention to the subject of the diseases of Wheat. The more he looked into the subject, the more convinced was he that science must be brought to the aid of agriculture, and as a proof of that he need only refer them to the beautiful farm which they that day had inspected. And here he might mention that when a few years since a prize was offered for the best essay on the subject, so little was known of it that when the council read over the papers that had been sent in they refused to accept either of them. Upon going through the fields that day he had observed that some of the ears were diseased. Now that disease was an infliction of an insect, but it looked very much like the work of fungi. That insect was known to them as the midge. If they went into the fields in June just before sunset and examined the Wheat, they would discover a little straw-coloured insect which left its eggs, which were hatched and destroyed the grain. They were in turn destroyed by the ichneumon. In threshing, the chaff contained the midge and should be destroyed.

The Earl of Essex proposed the health of their worthy host (loud cheers). Among the 350 gentlemen whom he saw around him, there might be some amongst them who did not coincide with all Mr. Mechi's views on agriculture generally, but he would take it for granted that they were all admirers of that gentleman, and that they looked upon the work in which he was engaged as one which would tend to promote the happiness of mankind. Mr. Mechi was one of those who, when he had undertaken a work which he considered right and proper, if he failed to succeed in it the first year, did not tamely give in. He thought the agriculturists should show themselves grateful to those tradesmen who, having been successful in other trades, invested their surplus earnings in developing the full powers of the land of their country. Mr. Mechi, by his experiments and patience, had set himself up as a beacon to show them the quicksands which they ought to avoid; and on the other hand his conduct was an incitement to others to follow out his experiments. In such a light they ought to look upon him, and as he was a man who desired well of his country, he should call upon them to drink his health with three times three.

Mr. Mechi on rising was received with loud cheers, which were several times renewed. He said if he were a vain man they would most assuredly spoil him. When he first turned his attention to farming he looked at it in the same light that he should any other matter of business where there was room for improvement, and he could only say that he did no more than he would in taking any other business. Having purchased this and other farms, he turned his attention to whether they would or would not prove a profitable investment, and he set to work to find out what was wanted, and he soon ascertained that the great bulk of his property wanted draining, good roads, deeper cultivation, more manure, and more integrity in its management. He should never forget the time when he first went over the Tiptree property. It was on a 25th of September; the day was wet, the land being part light and part bog was very much like bird-lime, and the more he walked the deeper he got into it, and he then felt that it was a state of things that was not at all satisfactory. The tenant said the land was very poor, and that he could not afford to pay for improvements, so he determined to make them himself. He had at the outset made some errors of a practical nature; but they were all corrected now. No clay was so stiff but that it could be amended, and if it was yellow clay let them make a good deep fallow, and expose it to the light and air. He told them not to put too much seed in the ground; all he put was 1 bushel per acre. He was happy to say that this year he should make a very large profit by his crop. He said this in no vain, boasting spirit for he knew the difference between 80*s.* and 40*s.* per quarter, but he made all his improvements when corn was cheap and when, at the same time, labour was cheap. He was of opinion that the great future for agriculture lay in the further development of steam power, and although the steam plough had been pronounced a failure, he believed that it was a very triumphant beginning. He would venture to predict that steam would yet be the great motive power of agriculture, and there was high hope for it in the name of steam. Having given some details of the comparative powers of steam with that of horses, taking for his data the reports of that valuable society the Royal Agricultural Society of England, he stated that it was sheer folly to place the two in competition together, and concluded by thanking the company for the honour they had done him in drinking his health.

Other toasts having been given and responded to, the assemblage separated highly pleased with the day's proceedings.

Miscellaneous.

Sale of Short-horns.—We are informed that the four yearling short-horn heifers, and the yearling short-horn bull, "Panmure," exhibited by Mr. Stewart Marjoribanks at Carlisle, have been sold since the Show to a French nobleman for 500 guineas; and will, with some short-horn cows and Aberdeenshire Scots, shortly be forwarded to his estate in Normandy.

The Hog Population of Cincinnati.—What crocodiles were in Egypt, what cows are in Bengal, or storks in Holland, pigs are in Cincinnati, with this trifling difference, their sacredness of character lasts but as long as their mortal coil; and this is abbreviated without ceremony, and from the most worldly motives. In life, the pig, if free, is honoured; he ranges the streets, he reposes in thoroughfares, he walks beneath your horse's legs, or your own; he is everywhere respected; but let the thread of his existence be severed, and, shade of Mahomet, what a change! They think in Cincinnati of nothing but making the most of him. How many of his kind perish annually to cement the vast prosperity of the city of hogs can scarcely be told. About 20 years ago Cincinnati contained only one-fifth of its existing population. A few bold speculators began the trade. Selecting the hams and sides of the animals, they made pickled pork; of the rest they took small account. Soon, however, the idea occurred to one more acute than his fellows, that the head and the feet—nay, even the spine and the vertebræ—might be turned to account; trotters and cheeks had their partisans, and these parts looked up in the market. About this time the makers of sausages caught the inspiration. They found these luxuries saleable, and so many pigs were to be slaughtered that the butchers were willing to do it for nothing; that is to say, for the perquisite of the entrails and offal alone. The next step was due to the genius of France. A Frenchman established a brush manufactory, and created a market for the bristles, but his ingenuity was outdone by one of his countrymen, who soon after arrived. This man was determined, it seems, to share the spoil; and, thinking nothing else left, collected the fine hair or wool, washed, dried, and combed it, and stuffed mattresses with it. But he was mistaken in thinking nothing else left. As but little was done with the lard, they invented machines, and squeezed oil out of it; the refuse they threw away. Mistaken men again. This refuse was the substance of stearine candles, and made a fortune to the discoverer of the secret. Lastly came one who could press chemistry to the service of mammon; he saw the blood of countless swine flow through the gutters of the city; it was all that was left of them, but it went to his heart to see it thrown away: he pondered long, and then, collecting the stream into reservoirs, made prussiate of potash from it by the ton. The pig was thus used up, and nothing else was left to turn to profitable account. A large trade is carried on in sausage-skins; the entrails and bladders fetch a good price. The congealed grease, forming the lard of commerce, is in extensive use for culinary purposes, for perfumery, ointments, salves, &c. The oil expressed from lard is chiefly used for burning, for lubricating machinery, and generally as a substitute for olive and other oils. *Mr. P. L. Simmonds, in the Quarterly Journal of Agriculture.*

Calendar of Operations.

JULY AND AUGUST.

Essex, *July* 31.—The Coming Harvest.—The Wheat is blighted, and some of the ears defective, but I think the crop will be above an average. Barley a large crop, but very coarse in quality. Oats a very good crop. Beans and Peas an average crop. Hay very short crop. I have heard no complaints of the Potatoes. Mangold Wurzels are very good. Swede Turnips are good at places, but in others have been very much damaged by the fly. The White Turnips are doing well. *William Hutley, Powers Hall, Witham.*

Forfarshire Glens, *July* 28.—This has been the driest season that we have experienced in this district for many years. The winter from January onward was uninterrupted frost and snow, and the spring—if it at all deserved the name—was hard, dry and ungenial up till the beginning of June; since then a milder atmosphere has prevailed, with frequently a very high temperature, and within the last two weeks some fine moderate showers, but as yet no copious fall of rain such as the crops and pasture stand in need of. The seed was deposited in a well prepared dry bed, and the braird promptly made its appearance, in most cases too thick; the usual deductions arising from unsound seed, excess of moisture, birds, grubs, &c.—for which something is always allowed—seem not to have been made. An excess of plants with an unusually dry season are likely to produce a short crop, especially of Oats. Barley being of more rapid growth has more nearly kept pace with the forcing influence of the atmosphere, and is less deficient in length of straw; both are in about an

average state of forwardness. The produce in grain will likely be small, but very much will depend upon the kind of weather we may have before harvest. Hay making is in progress, the crop a very poor one. Turnips were "dorty" during the first stage, but since hoeing they have got on with life and vigour, plenty of plants, and a fair prospect of a full crop. The Potato never unfolded a broader leaf, or showed a fuller flower, even in its palmiest days before the "forty-five;" neither token nor talk of disease. Pastures have all along been deficient, both in hill and valley. The flush of the season is now past upon rotation fields, but the hills and all natural Grasses would yet make up if once well moistened. Sheep shearing is over, and the wool sold; the clip has rather unexpectedly turned out a full average one, and the price is fair, 9*d* per lb. for blackfaced washed wool. The crop of lambs is good as to numbers, but they are small, and not a few show evident signs of early privation. The young grouse are few and small, and to give them a fair chance, sportsmen would require to defer the assault until the end of August. Those who got early to the peat moss have secured their winter fuel in excellent order; others still await the chances offered by our changeful climate. An idea may be formed of the temperature of the early part of the season from the fact that some of the peat mosses were still frost bound on the 15th of June. *S.*

Lincolnshire, *July* 31.—We have been so engaged at Carlisle that I have had no time to look round, so my report will, I fear, be a poor one. Wheats are in full crop, and at present have not much injury. They have good ears, long and full, and should the weather be favourable, we shall have an abundant harvest. Oats have recovered much from the shocking state they were in two months since. The crops are not heavy, but now look healthy. Beans are a splendid crop, flowered well, and are well podded. Peas are good, but not equal to Beans, though the prospect is good for the crop. Barley we have so little that I need not speak of it. Potatoes are all looking well at present, and we have a large breadth set. I think the weather will cause some disease again; I recognised it on my way home. Mangold Wurzel have improved much, and grow fast, but Turnips have had too many showers, and look "starved." Hay and Clover crops are very light, and none got well, and it continues to rain daily. *Jn. Clarke, Long Sutton.*

Northumberland, *Aug.* 2.—Had I been called upon to give an opinion of the growing corn three weeks ago, it would have been more favourable than now. During the long continuance of cold weather in the late spring, all corn looked most unpromising, except on land that was drained and under high cultivation; never was there such a marked difference between land under liberal management and that which is still undrained and poorly cultivated. On the change to mild weather, a rapid improvement took place on all, and corn on the former description of land made great progress, bearing the appearance of a full crop. In many parts, however, it has proved too bulky to stand up against the very heavy rains which have prevailed for the last three weeks, and being laid while the straw was in a green and soft state, it is less likely to recover, or to fill well in the ear. This applies chiefly to Wheat. A brisk wind and bright sun would still do a good deal to recover it, but the weather continues to be unsettled and gloomy. The lighter crops which are standing are in good ear and may prove an average for such land as they occupy, but are backward. I should say, that under all the circumstances, and with the prospect of a late harvest, Wheat is not likely to come up to an average in this and the northern counties. Barley is a full crop, and in a few places beginning to change colour. Oats decidedly below an average. From present appearances, I should say that there will be no general harvest till September. Hay was generally a good crop, but much of it has been injured by bad weather in the making. Grass in pastures is very abundant. Early sown Turnips are good, but the weather has been too wet for the late ones. Potatoes are very promising, and so far free from disease. Leicester and half-bred wool has been sold readily at from 13*d*. to 14*d*. per lb. Store cattle and sheep continue to bring high prices. *John Grey, Dilston.*

Suffolk, *Aug.* 2.—Although the weather has been wet and unsettled for the last two or three weeks, our crops in this district generally promise favourably. Wheat is strong and healthy, and stands up well. The stiff staple soils this season will carry the day, although the light lands are marvellously improved. We have complaints as usual of midge, mildew, and defect in the set of the ear, but these are partial. I estimate the crop (at present) as a full average, and perhaps beyond; although, until the result be fairly tested by threshing, no accurate opinion can be formed. Harvest will commence upon Talavera in a week from this date. Barley is a very short crop; much of it is laid, and it is feared may be thin and inferior in quality. Beans and Peas, fair crop, but a good deal of disease has appeared in the last four days. Oats only grown to a small extent in this neighbourhood, but the early sown are unusually promising. Potatoes doing well—no disease worth naming. *J. Edwards, Jr., Woodbridge.*

Sussex, *August* 2.—The Wheat upon the hills in my neighbourhood is thin, and will be considerably below an average crop; upon the best soils it is good, and although much injured by the late heavy rains, will, I think, produce an average crop. Barley, Oats, and spring Beans good. Winter Beans very bad. *H. Scott Hayward, Willingdon.*

West Sussex, *Aug.* 1.—Since our last report we have a good deal of rain, and it has been very warm, so that now the Grass grows with a vigour that we have not been accustomed to for more than a year; the consequence is that lean stock of all kinds are in demand, and as most had run their live stock low they must now look to buying in even with high prices. But the rain that has done so well with the Grass has not had the good effect upon the Turnip crop that we expected; those that were hoed or fit for it at the time the rain came have done little since until the past few days that they seem to have recovered. The earlier sown Swedes are nearly all what we term "blind hearted." It appears to have been the effect of the dry weather causing them to make an effort to run to seed. The same disease has prevailed to a very great extent among the Cabbages in the gardens. The timely rain preserved the later sowings. Mangold does well, and does not show such a tendency to run to seed as last year. Potatoes look extremely well, so far as I have seen. There have been slight rumours of disease, but I have found no one who has seen it. Respecting the Wheat crop the accounts are very conflicting; some say it is very much blighted, which we believe is true on some of the lighter lands; and it is to some extent the case on the heavy and good land, and within the past three or four days it has not looked at all promising. It is not laid so much as we might have expected. Barley looks well, and Oats though shorter than usual promise to corn well. Harvest is now begun among Peas, which are generally a good crop. Wheat harvest will be general about the 13th; Oats may be a few days earlier. *G. S.*

Notices to Correspondents.

Corn Crushers, &c.: *Barrackpore.* The best hand chaff cutter at Carlisle was by Richmond & Chandler, of Salford; the best mill for grinding corn was by Clayton, Shuttleworth, & Co., of Leicester; the best corn-crusher by Turner & Co., St. Peter's Works, Ipswich. These awards are as good answer to your question as we can give.

As Lime: *J. Lake.* We do not know of any tract on this subject. Every work of recent date on agriculture contains reference to gas lime among the manures. It is chiefly useful for the gypsum which after long exposure to the air it is found to contain.

Lois Weedon: *A H.* We have not heard this year; but last year the produce was abundant and profitable, and the system up till then had realised the expectations expressed in the paper to which you refer.

THE HARVEST.

DRUMMOND'S IMPROVED REAPING SCYTHES continue to give every satisfaction, and the demand is yearly on the increase. They are as usual got up with every possible care, and are fitted with the very best picked blades. Price for three Scythes complete, 30*s*.; do. for six, 56*s*. Carriage paid to the principal Railway Stations throughout the kingdom. W. Drummond & Sons, Seed and Implement Warehouse, Stirling, N.B.

*** To prevent disappointment early orders are respectfully requested.

N.B. Unknown correspondents will please accompany their orders with a remittance.

REAPING MACHINE.

WILLIAM DRAY and CO.'S Book of Testimonials from purchasers of their Patent Reaping Machines, also a List of Prizes, and full description will be forwarded, post free, on application to

Wm. Dray & Co., Swan Lane, Upper Thames Street, London.

SCYTHES.—Boyd's Patent Self-Adjusting Scythes may be had of the Manufacturers, William Dray & Co., Swan Lane, London, and of all Ironmongers and Seedsmen.

A liberal allowance to the trade.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
First Prize Awarded to

RICHMOND and CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.

Catalogues Gratis.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY.
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London. Drawings forwarded by post.

WARNER'S IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in acids. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs [illegible] The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe 1*s*. 6*d*. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s*. 6*d*. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in. short	1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1 12 0
2½ „ long	3 „ 3 „		1 15 0
3 „ ditto	3 „ 6 „		2 12 0
3½ „ ditto	3 „ 6 „		2 18 0

2½ „ short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing			2 12 0
2½ in. long ditto	ditto	ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER and SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

JOHN WARNER and SONS, Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader.

is strongly recommended for durability and low price, viz. 2*l*. 19*s*., to [illegible] 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., [illegible] gals., & 55 gals. May be obtained of any Ironmonger or Plumber in town or country, of the Patentees and Manufacturers

as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Plans sent on application. Syringes of various constructions and sizes from 9*s*. upwards. Metallic String from 5*d*. to 1*s*. 3*d*. per ft.

JOHN WARNER and SONS, 8, Jewin Crescent, London, Manufacturers of FIRE ENGINES, PUMPS, GARDEN ENGINES, and SYRINGES.

All articles of John Warner & Sons' manufacture may be obtained of any Ironmonger or Plumber in town or country, at the advertised prices.

John Warner & Sons having been practical Horticulturists for many years, know exactly the requirements of both Amateurs and Gardeners. A gardener with a properly constructed pump will get through as much work in five minutes as he could with any Syringe in a quarter of an hour, and with half the labour to himself. Syringes are economical for small houses.

No establishment offers such a variety of effective machines for hydraulic purposes, whether to supply Gardens, Hothouses, Cottages, Farms, Mansions, or Boards of Health, with every requisite connected with the conveyance and distribution of water.

Fountains suitable for Conservatories, Lawns, &c.

Sheets of Engravings sent on application.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. H. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2s. 6d. each, or free by post, 4s.

MANUFACTURED BY

JOSLIN AND SONS,
IRONMONGERS, Colchester.

Retailed by all the principal Ironmongers.

Wholesale Agents:
W. THOMPSON & SON, 15, Upper North Place, Gray's Inn Road, London.

CHASE'S BEETLE POISON,

ENTIRELY FREE FROM DANGER TO HUMAN LIFE, AND PERFECTLY HARMLESS TO CATS AND DOGS.

A Safe and most Effectual Destroyer of Black Beetles and Cockroaches; one trial alone will suffice to prove its great efficacy, and one box will destroy thousands. The great advantage in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.

Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.

Sold in boxes at 1s. each, by THOMAS CHASE, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all wholesale medicine vendors.

To the Editor of the "Cottage Gardener," July 3d, 1855.

"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*

(ED.—This is not a mere puff, but sent to us by a gentleman who has been benefited as he states.)

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1s. each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. HARVEY, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors Wholesale Agents, BARCLAY & SONS, and MARSDEN & SONS, London.

GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

		Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	...	7d. per yd.	5d. per yd.
2-inch " strong "	...	9 "	6½ "
2-inch " extra strong "	...	12 "	9 "
1½-inch " light "	...	8 "	6 "
1½-inch " strong "	...	10 "	8 "
1½-inch " extra strong "	...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

SOUND AND WHITE TEETH are not only indispensably requisite to a pleasing exterior in both sexes, but they are peculiarly appreciated through life as a blessing highly conducive to the purposes of health and longevity. Among the various preparations offered for the purpose,

ROWLAND'S ODONTO, or PEARL DENTIFRICE,

stands unrivalled in its capability of embellishing, purifying, and preserving the teeth to the latest period of life. Prepared from Oriental herbs with unusual care, transmitted to this country at great expense, this unique compound will be found to eradicate all tartar and concretions, and impart a pearl-like whiteness to the enamelled surface, remove spots of incipient decay, render the gums firm and red, fix the teeth firmly in their sockets and, from its aromatic influence impart sweetness and purity to the breath. Price 2s. 9d. per box. Caution.—The words "Rowlands' Odonto" are on the label, and "A. ROWLAND & SONS, 20, Hatton Garden," engraved on the Government stamp affixed on each box. Sold by them, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2s., or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

CURE OF CHRONIC COUGH, BY DR. LOCOCK'S PULMONIC WAFERS. From Mr. J. Smedley, Bookseller, Sleaford.—"Gentlemen,—I can speak with confidence, particularly of the Pulmonic Wafers, with which I have been not only relieved, but cured, of a Chronic Winter Cough. Hundreds of boxes I have sold, and still the sale is as great as ever. Signed, J. Smedley"—Dr. LOCOCK'S Pulmonic Wafers give instant relief and a rapid cure of Asthma, Coughs, and all Disorders of the Breath and Lungs. To singers and public speakers they are invaluable, for clearing and strengthening the voice. They have a most pleasant taste. Price 1s. 1½d., 2s. 9d., and 11s. per box. Sold by all Chemists.

MEDICAMEN VIRTUTIBUS FLORENS.

DISCOVERY EXTRAORDINARY! Dr. ARNOT'S PILLS.—The speedy cures effected by this new discovery in Medicine, where all other remedies have failed, are most extraordinary, as testified to by the numerous testimonials daily received by the proprietor from all classes of society, who have been restored to health by these Pills. They create by their peculiar action on the LIVER and the DIGESTIVE ORGANS a new and sanatory state of the blood and other vital fluids, by which means the morbid conditions of the body are immediately removed. They, moreover, strengthen the constitution, and speedily restore the patient to health.—In boxes, at 1s. 1½d. Depôt, 50, Rathbone Place, London. Order through any Chemist. By post for 14 Stamps.

HOLLOWAY'S OINTMENT AND PILLS WONDERFUL FOR THE CURE OF SCROFULA.—Copy of a letter from Mr. Wm. Frite, bookseller, Sturminster, Newton. "To Professor Holloway. Sir,—Mr. Thomas Harris, yeoman, Hinton St. Mary, Dorsetshire, was for many years severely afflicted with Scrofula. He tried many medicines in the hope of effecting a cure, but all failed: the disease very materially retarded his usual occupation, therefore he determined on trying HOLLOWAY'S Ointment and Pills, and by their use he is rejoiced to be able to state that he is now recovered."—Sold by all Medicine vendors throughout the world, at Professor HOLLOWAY'S establishments, 214, Strand, London, and 80, Maiden Lane, New York; by A. Stampa, Constantinople; A. Guidicy, Smyrna; and Dr. Sankey, Malta.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with complete confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

It is entirely free from nauseous flavour, and being invariably and carefully submitted to chemical analysis—AND ONLY SUPPLIED IN SEALED BOTTLES TO PRECLUDE SUBSEQUENT ADMIXTURE OR ADULTERATION—this Oil possesses a guarantee of genuineness and purity offered by no other Oil in the market.

TESTIMONIAL from ARTHUR H. HASSALL, M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—AND THIS UNKNOWN TO YOURSELF—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

PRUDENCE.

HOW much pain, regret, and evil may be avoided by timely forethought! If it be desirable to economise money and time, is it not still more important to economise our health?

The prudent man pays attention to the slightest derangement in his physical organisation. When he finds himself "out of order," he should resort to the world-famed remedy, PARR'S LIFE PILLS, and thus the incipient malady will be checked.

In all quarters of the globe the reputation of PARR'S LIFE PILLS is fully established; and it is a fact, that no "household words" are more familiar with the people than those of the invalid, who speaks of health restored as the consequence of using PARR'S PILLS.

☞ Ask for PARR'S Life Pills.

STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, 10th August, after the sale of Established Plants, an importation just received from Manilla of Phalænopsis amabilis and two species of Saccolabium, to which will be added a few fine Plants of Cattleya Acklandiæ and Miltonia maculata.—May be viewed on the morning of sale and Catalogues had.

ORCHIDS.

MR. J. C. STEVENS is favoured with instructions to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on FRIDAY, August 10, at 1 o'clock precisely, a COLLECTION of ORCHIDS, the property of a Baronet who is declining their cultivation. The following are amongst the choice varieties included, viz.:—

Vanda suavis (Veitch's true)	Saccolabium Blumei
" cærulea	" " (major)
" tricolor	" guttatum
Cattleya labiata	Phalænopsis grandiflora
" violacea	&c. &c. &c.

Also three splendid plants of Nepenthes ampullacea.
May be viewed on the morning of sale, and Catalogues had.

NORBITON NURSERY.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. J. WILLMER is instructed by Mr. S. Hook to Sell by Auction, on the Premises, Norbiton Nursery, near Kingston, on MONDAY, August 6th, at 12 o'clock, the whole of the STOCK of the above Nursery, which comprises a choice and valuable collection of Geraniums, Fuchsias, Chrysanthemums, Dahlias in pots; a Span-roof Propagating House, Pits, Lights, Boxes, Striking Glasses, Garden Pots, Tools, a quantity of Leaf Mould, &c.—May be viewed the day preceding and morning of sale; and Catalogues had on the premises, and of the Auctioneer, Sunbury, Middlesex.

HURSLEY PARK, NEAR WINCHESTER.

IMPORTANT SALE OF PURE SOUTHDOWN SHEEP, &c.

MR. STRAFFORD has received instructions from Sir William Heathcote, Bart., M.P., to announce for Sale by Auction, on WEDNESDAY, August 22d, at the Home Farm, Hursley Park, the FLOCK of PURE SOUTHDOWNS, consisting of about 700 Ewes, of various ages, with Rams and Lambs; the whole of which have been bred from the best blood in the kingdom. Also some valuable Young Horses, Hursley Pigs, &c.—Catalogues, with particulars, will shortly be issued, and announced in future advertisements.

London, 13, Euston Square, August 4.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. Burgess & Key, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. Francis Parkes & Co.

DO YOU BRUISE YOUR OATS YET?—One bushel of Oats when Crushed will make two. Great saving. OAT BRUISERS, Chaff-cutters, Ploughs, Threshing Machines, Flour Mill Carts, Corn Dressing do., Horse and Steam Machinery put up, &c. Book on Feeding, 1s.

M. Wedlake, 118, Fenchurch Street, London.

PAXTON WORKS, SHEFFIELD.

SAYNOR and COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to Saynor & Cooke for their superiority of material and workmanship. Established 1738.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, and COMBINED THRESHING, STRAW SHAKING, RIDDLING and WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

NEW INVENTION IN LAWN MOWERS, which possess Superior Advantages to any Machines now in Use.—In the first place, they will cut the Grass either wet or dry; secondly, by the simple adjustment of a thumb-screw, they can be made to cut Grass either long or short; and, thirdly, these machines are drawn instead of being pushed and drawn, and consequently do not require half the usual power to work them. They are made to cut any width suitable for either man or horse. They will turn in very little room and cut at the same time. They are a perfect roller for the width they cut when thrown out of gear. The improvement can be attached to old machines, consequently old machines that are now laid aside, can be brought into use at a small expense.—N.B. These Machines can be adjusted and wrought by any unskilled labourer.

Price to cut 16 inches, £6 | Do. 20 inches, £7 | Do. 24 inches, £8.

Testimonial from Joshua Major, Esq., *Landscape Gardener, Knosthorpe.*

To Mr. Green, Leeds.

"Sir,—As I always appreciate public and useful improvements, I most gladly give my testimony to your highly improved Mowing Machine. The one sent for my inspection and trial (cutting a breadth of 24 inches) was drawn on flat ground with ease by one person, and although at the time of trial the lawn was wet, it was cut with the greatest nicety. So complete and simple is the invention, that amateur gentlemen and even ladies may work either the 16 or 20 inch size with ease and pleasure, providing the Grass is not too long. For extensive places I should say the largest size (24 inches) would be most suitable, for even in undulating ground two persons may work it, but in flower gardens, when beds, &c, are crowded, either of the smaller sizes would be best. I congratulate you on your very valuable and useful invention, which, in my opinion, entirely surpasses and must eventually supersede all others, for it is not only free from intricacy and easy to the workman, but extremely expeditious in its operations, and consequently must prove a great saving in the management of Grass Lawns, and a great boon to the public.—I am, Sir, your most obedient servant,

"Knosthorpe, near Leeds, July 19. Joshua Major."

Several Machines of the old kind, in stock, will be sold at half price, viz.:—16 in., 3*l.*; 20 in., 3*l.* 5*s.*; 24 ins., 3*l.* 15*s.*

THOMAS GREEN, Sole Manufacturer.

Iron and Wire Works, North Street and Briggate, Leeds.

UNDER THE PROTECTION OF HER MAJESTY'S ROYAL LETTERS PATENT.

JOSEPH PASCALL begs to announce to the Horticultural and Floricultural Public—amateur and professional, that he is manufacturing an entirely new Garden Pot, which possesses, in a cultural point of view, many permanent advantages over pots now in general use. In the first instance, it is intended to be used in the growing, forcing, and blanching of Seakale in winter; blanching Seakale, &c. &c. in the open garden; and, when not required for these purposes, it is so constructed as to be made available in the cultivation of plants of every description. These pots are manufactured in various forms and sizes, viz.—as propagating, seedling, shading, and protecting pots and pans; and are likewise admirably adapted to the cultivation of Mosses, Ferns, and many rare and choice exotic plants.—For a more detailed description see *Gardeners' Chronicle*, July 7, p. 453.

Joseph Pascall, Patentee.

West Kent Potteries, Chislehurst, Kent.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

THE BEST PROTECTOR from the HEAT of the SUN.

"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

DEANE, DRAY, and CO. are sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with their Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom. Also, Wholesale and Retail Agents for SAYNOR'S celebrated PRUNING KNIVES, used exclusively by the first Gardeners in the United Kingdom.

DEANE, DRAY, & CO. (Opening to the Monument), London Bridge.

TO NURSERYMEN AND GARDENERS.

REIGATE SILVER SAND, 12*s.* per ton, 1*s.* 6*d.* per bushel, or 16*s.* per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2*s.* each. Kentish and other Peats and Loam of excellent quality.

Kennard Brothers, Swan Place, Old Kent Road.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth [illegible] without trouble, by sending 30 postage stamps and a [illegible] envelope to Mr. William Franklin, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or [illegible] ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

GAME NETTING.—The undersigned would be obliged by Specimens of Wire Netting adapted to keep out Hares and Rabbits, with price per yard; the width must be 36 inches.—J. R. & A. Pearson, Chilwell, Nottingham.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards 50*s.* Canvas, for Wall Fruit.—At EDGINGTON and Co.'s Flax Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by Waithman & Co., Bentham, Lancaster.

No. 1 Quality, Inches in Diameter and Price Per Yard—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Super Extra Stout Quality:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.*; 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard.

Union Joints, Branch Pipes, and Jets are also supplied.

FILTRATION BY ASCENSION.

RANSOME and CO., sole Patentees of the New AUTOMATON PURIFIER; also manufacturers of every variety of FILTERS (Portable or for Immersion) fitted with the Patent Purifying Medium. Pure Water, in any quantities, for Water Companies, Manufacturers, and others, obtained at a very moderate cost by the use of Ransome's Filtering Slabs. An Illustrated Priced List on application to the Depôt, Whitehall Wharf, Cannon Row, Westminster, or at the Patent Stone Works, Ipswich. A liberal discount allowed to the Trade. Filter Manufacturers and Exporters supplied with Ransome's Patent Filtering Medium separately, on the lowest terms.

Ransome & Co. are also the Patentees and sole Manufacturers of the Patent "Iris Fountains" for Drawing Rooms, Conservatories, &c.

RANSOME'S SILICEOUS STONE.

THE PATENT SILICEOUS STONE COMPANY are prepared to execute Contracts for the supply of all kinds of Ornamental Details for Buildings, &c., manufactured in this beautiful material, which has received the approval of eminent architects and scientific men, and which for sharpness of outline, durability, and cheapness, stands unrivalled. It is especially applicable for the elaborate details of Mediæval and Ecclesiastical Architecture, for Gothic Windows, Doorways, Pinnacles, &c.; Crosses, Corbels, Altar Screens, Pulpits, Fonts, Monumental Tombs, Tablets, Headstones, &c; also for all kinds of Garden Decorations, Fountains, Figures, Vases, and Pedestals, Flower Boxes, Wardean Cases, Balustrades for Terrace Walks, Gate Piers, Caps, Bases, &c. &c.; and for Coats of Royal Arms, Chimney Pieces, Brackets and Trusses, Ashlars, Quoins, String Courses, and other Dressings.—Further particulars, with illustrations, on application to Mr. Edwd. Mendham, Secretary, at the Company's Offices, Whitehall Wharf, Cannon Row, Westminster; or to Mr. F. Ransome, Patent Stone Works, Ipswich.

WATERPROOF PATHS.

BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one-fifth river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not seek its level, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

BLACK JAPAN VARNISH.—This article will be found from its durability and cheapness of the greatest utility for Painting Hurdles, Wire-work, Palings, Gates, Fences, &c., and out-door work of every description, whether of Wood or Iron. Its value has been proved by the test of time. It should be well stirred up before using and applied cold. This Varnish will retain its quality for any length of time, provided the cask be kept closed.

May be obtained through any ironmonger: or of John Watkins & Sons, 8, Jewin Crescent, London.

N.B. Sold in casks containing 14 or 7 gallons, at 2*s.* per gallon. Casks (which cannot be returned), 5*s.* and 3*s.* each.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything as the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to Walter Carson & Son, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent thereto.

Printed by William Bradbury, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 27, Lincoln's Inn Street, in the Parish of St. Margaret and St. John, Westminster, both in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul, Covent Garden, in the said County, where all Advertisements and Communications are to be Addressed to the Editor.—Saturday, August 4, 1855.

GRAND
METROPOLITAN DAHLIA AND HOLLYHOCK SHOW.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of Her Most Gracious Majesty the Queen.—The last Exhibition of the above Society for the present season will take place at the Royal Cremorne Gardens, Chelsea, on THURSDAY, August 30, in conjunction with the Grand Metropolitan Dahlia and Hollyhock Show (Open to all Exhibitors).

Lists of Prizes and the Rules of the Exhibition may be had of the Secretary, J. T. Neville, Ebenezer House, Peckham.

GRAND HORTICULTURAL AND FLORICULTURAL EXHIBITION, Open to All England, will be held at the Arboretum, Leamington, WEDNESDAY, August 22, 1855. Prizes for Collections and Single Specimen Stove and Greenhouse Plants, Cut Flowers, Fruits, and Vegetables, to the amount of 80*l.* are offered for general competition. Schedules and every particular may be had on application to

Priory Gardens, Warwick. J. Cheyne, Secretary.

SALISBURY HORTICULTURAL SOCIETY.—The ANNUAL DAHLIA EXHIBITION, offering the highest amount of Prizes that will be given this season at any Show, will be held in conjunction with the Horticultural Society, in the Gardens of the Lord Bishop of Salisbury, on THURSDAY, Sept. 6th.—Full particulars of John Keynes, Hon. Sec.

ROYAL PAVILION, BRIGHTON.

THE BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY will hold their Autumn Exhibition of PLANTS, FRUITS, CUT FLOWERS, &c., on WEDNESDAY and THURSDAY, 12th and 13th of September next, at the above splendid suite of Rooms and Grounds, on the same grand scale as former years. Prizes are offered with the same liberality as previously. Also the Railway Cup, value 10 guineas, for the best 24 Show Dahlias for Amateurs. By the liberality of the Railway company, all plants, &c., will be conveyed to Brighton and back, carriage-free, from all stations on the lines. Schedules can be had on application to E. Spary, Superintendent of the Exhibition; or the Secretary, E. Carpenter, 45, Lavender Street, Brighton. By order of the Committee, E. Carpenter, Secretary.

TO NURSERYMEN AND OTHERS.

Sewers' Office, Guildhall, Aug. 2, 1855.

CITY OF LONDON CEMETERY.—The Commissioners of Sewers of the City of London, acting as the Burial Board for the said City, hereby give notice that they will meet at Guildhall on Tuesday, the 11th day of September, at 12 o'clock precisely, for the purpose of receiving TENDERS for the supply of TREES and SHRUBS for the Cemetery now being formed at Little Ilford, in the county of Essex.

Forms of Specification with Schedules, to which the prices are to be affixed, may be obtained on and after the 20th day of August, at the office of Mr. William Haywood, Surveyor to the Commissioners, 14, Old Jewry Chambers; or at the Office of Mr. Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square.

Joseph Daw, Principal Clerk.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

JOHN HARRISON, Nurseryman, Seedsman, Florist, Landscape Gardener, &c.

Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, Aug. 11.

" " HEARTSEASE	... ... 2 6	"
" " DIANTHUS'S	... ... 2 6	"

See former Advertisements.

Address W. PRESTOE, Florist, &c., Basingstoke, Hants.

SEEDS FOR PRESENT SOWING.

JOHN CATTELL has the following now ready to send out, post free, at the prices annexed. The CALCEOLARIAS are very superior, and warranted to give equal satisfaction to those sent out by J. C. for so many years.

	Per packet.—*s.*	*d.*
Calceolaria, saved from the finest vars., carefully hybridised	2	6
Do. from an entirely new class, of very rich colours, large, and extraordinary fine blooms	5	0
Cineraria, from finest varieties	2	6
Geranium, from first rate florist varieties	1	0
Do. do. fancy varieties	1	0
Schizanthus retusus and albus, each	0	6
Anemone, single Poppy, extra fine	0	6
Mimulus, from finest varieties	0	6
Mignonette, New Giant	0	4
Alstrœmeria acutifolia, splendid scarlet conservatory climber	1	0
Do. Van Houtte's, superb Chilian hybrids, mixed	0	6
Tropæolum tricolorum grandiflorum	1	0
Heartsease, from fine named varieties	1	0
Helianthemum, or dwarf rock Cistus, from 30 vars., mixed	0	6
25 varieties, fine showy hardy Annuals, for early spring flowering, in the open ground	5	0
12 varieties, from showy half hardy Annuals, for early flowering, in the greenhouse	3	0

A remittance in stamps or otherwise must accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, John Waterer has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Aug. 11.

CALCEOLARIA AND CINERARIA SEED.

J. DOBSON AND SON are now sending out Seeds of the above, saved from an unequalled collection, in packets. Cineraria, 1*s.*; Calceolaria, 1*s.* 6*d.*, 2*s.* 6*d.*, 3*s.* 6*d.* and 5*s.* each.

Woodlands Nursery, Isleworth.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, Aug. 11.

CALCEOLARIA SEED.

J. SMITH, the raiser of SULTAN, has, with great care and perseverance, raised the finest Shrubby CALCEOLARIAS in England, and by impregnation has saved a small quantity of Seed, which he offers at 5*s.* per packet. If not turning out first-rate the money will be returned. Three new Seedlings will be sent out soon.

Apply to J. Smart, Hendon Place, Hendon, Middlesex.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1*s.* 6*d.* and 2*s.* 6*d.* each. Also choice CINERARIA seed saved from the finest named varieties, at 1*s.* 6*d.* and 2*s.* 6*d.* per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

N. GAINES having been fortunate in saving seed from the superb CALCEOLARIAS he exhibited so successfully at the Royal Botanic, Regents' Park, and Crystal Palace Exhibitions, he is prepared to offer it at 5*s.* per packet. Early orders are solicited as the stock is very limited.

Nursery, Surrey Lane, Battersea, August 11.

NEW PELARGONIUMS raised by J. Beck, Esq., of Isleworth; and T. White, Esq., of Wetherfield, Essex. Catalogues with full descriptions and prices of these fine varieties forwarded post free for one stamp, on application to John Dobson & Son, Florists and Seedsmen, Woodlands Nursery, Isleworth.

CARNATIONS AND PICOTEES in full bloom for Sale: 150 store pots of the best varieties, all Show Flowers. Each pot will make from four to eight pairs of plants.

To be seen at Mr. R. Parker's, Florist, Mayfield Road, Dalston, London.

DUTCH FLOWERING BULBS.

JAMES CARTER AND Co.'s comprehensive CATALOGUE OF DUTCH AND CAPE BULBS, AND SEEDS, for Autumn sowing, will be published on the 1st of September next, and will be forwarded, free of charge, and post paid, upon application to James Carter & Co., 238, High Holborn, London.

TO THE TRADE.

JOHN MORSE begs to offer fine mixed PERSIAN RANUNCULA, containing nearly 100 sorts, all good Double Flowers, at 20*s.* per 1000; also good mixture TULIPS, at 20*s.* per 1000. The above being the surplus stock of an amateur florist can be strongly recommended.

The Nursery, Dursley, Gloucestershire.

TRIPOLI ONION.—The trade can be supplied with SEED of the true flat Tripoli Onion, by Nutting & Sons, Seedsmen, 46, Cheapside, London.

WANTED, 5000 BLACK ITALIAN POPLARS, 10 to 12 feet high, good stout trees. Apply, with price, delivered free to the Ipswich Railway Station, to W. B. Jeffries, Nurseryman, &c., Ipswich.

MONTSERRAT PINES.

TO BE SOLD, about 35 MONTSERRAT PINES, Succession Plants.—For further particulars apply to Francis & Arthur Dickson & Co., Nurserymen and Seedsmen, 14, Corporation Street, Manchester.

TO MARKET GROWERS, NURSERYMEN, ETC.

TO BE SOLD, 80 dozen clean, large, well grown CYTISUS in 48 pots. The whole may be bought for 12*l.*—R. Bullen, Dulwich Common, Surrey. Inquire at the Alleyn's Head.

TO BE SOLD, a Case of Imported ORCHIDS, containing 54 pieces, mostly large and principally in fair condition; varieties of Oncidium, Epidendrum, Brassia, Schomburkia, Ionopsis, Phaius, Hedychium, &c.; price 2*l.* 14*s.* To be seen at Mr. George Roberts, 32, Moorgate Street, London.

CUTHILL'S STRAWBERRY PLANTS.—The early and hardy BLACK PRINCE, and late PRINCE OF WALES, two celebrated sorts, will be sent out on and after August 15th. They are both enormous bearers, and either of them makes a most delicious and solid preserve, to which upwards of 300 ladies round here can testify. The Black Prince, 5*s.* per 100; the Prince of Wales, 7*s.* 6*d.* per 100.

J. C.'s Pamphlet on the Potato, Strawberry, Asparagus, Seakale, Rhubarb, Wine, &c. Preserve, 2*s.*

J. C.'s Market Gardening round London, 1*s.* 6*d.* See the recommendation of it in the "Quarterly Review." Early orders requested. Post-office orders payable at Camberwell Green.

James Cuthill, Camberwell, London.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*; 50 plants, 12*s.*; 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. Lindley describes it as being exhibited at Chiswick, July 11, 1855:—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle*, Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"Ward's *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

7, Bridge Street, York.—August 11.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

(Fig. 1.) (Fig. 2.)

J. TYLOR AND SON'S BARROW GARDEN ENGINE (Fig. 1), in best well painted oak tub, fitted with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 1 holds	10 gallons,	throws	30 feet high		...	£4	10
No. 2	15	"	"	45	"	...	5	10
No. 3	28	"	"	45	"	...	6	18

J. TYLOR & SON'S BARROW GARDEN ENGINE (Fig. 2), in strong tinned iron tub, well painted inside and outside, with improved Pump, universal joint, and registered Spreader, which answers the purpose of the separate rose fan and jet.

No. 10 holds	8 gallons,	throws	25 feet high		...	£2	15
No. 13	12	"	"	30	"	...	3	5
No. 11	16	"	"	40	"	...	4	0
No. 12	24	"	"	45	"	...	5	0
No. 14	30	"	"	45	"	...	5	18

A large assortment of every description of Garden Syringes, Pail Engines, Conservatory Pumps, &c., kept in Stock.

No. 1, Plain Syringe, with rose and jet, diameter of barrel, 1½ inch, 14*s.* 3*d.*; No. 2, do., diameter of barrel, 1⅜ inch, 12*s.*; No. 3, do., diameter of barrel, 1⅜ inch, 10*s.* 6*d.*

READ'S SYRINGE, with two roses and one jet, 19*s.*

J. TYLOR & SON'S Horticultural Apparatus may be obtained at these prices from any respectable Ironmonger or Seedsman in town or country, through whom alone they will be supplied, and of whom Drawings and Prices may be had.

N.B. Cost of carriage, &c., not included in these prices.

J. TYLOR & SON'S Manufactory, Warwick Lane, Newgate Street, London.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—Small size, for Amateur use, **21s.** each. Large size, for Gardeners' use, **25s.** each.

Extra for Telescope Tube as shown in engraving for watering plants on stands at a height of 8 feet, so that any quantity of water can be deposited in the pot without wetting the leaves, 10*s.*

By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground in ball valves and fittings used for filling all other patent Syringes being entirely superseded. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

N.B. These prices do not include carriage, package, or expense of delivery in the country.

IMPORTANT TO GROWERS OF ROSES.

NEWLY-INVENTED APHIS BRUSH, OR GREEN FLY DESTROYER.—The attention of Florists is particularly called to this Cheap and Ingenious Instrument, invented by the Rev. E. S. BULL, of Colchester, which, in a very simple and easy manner, instantly cleanses the Rose from that destructive insect the Green-fly (or Aphis), without causing the slightest injury to the bud or foliage.

Price 2*s.* 6*d.* each, or free by post, 4*s.*

FILBERT MERVEILLE DE BOLWYLLER, large and very prolific, 7*s.* 6*d.*

The Trade supplied.—Nursery, Hammersmith.

NEW INDIAN AZALEA, "EULALIE VAN GEERT."—This fine and distinct variety may be recommended as one of the best of this fine tribe of floricultural plants, and which has been admired by all the amateurs who saw it in bloom. It is of free growing and robust habit. The flowers of the largest are of good form and substance; colour rose and white, spotted with bright rose. Plants will be sent out next spring at 7*s.* 6*d.* and 21*s.* each, one over for every three taken; the first subscriber will, of course, obtain the best plants. Orders will also be received at my Agent's, Mr. R. Silberrad, 5, Harp Lane, Tower Street, London, from whom my Catalogue of Plants may be obtained on application.—N.B. The plants will be delivered free to London; see opinion in *Gardeners' Chronicle* of May 26th and it will be figured in the works of Messrs. Van Houtte and A. Verschaffelt of next month.

A. V. G. also begs to offer the following new and recommendable plants at reduced prices.

N.B. The Ghent steamer Flèche, for London, sails now regularly twice a week; by this way the expense of carriage is much reduced.

A. Van Geert, Nurseryman, Ghent, Belgium.

TO LOVERS OF PLANTS WITH HANDSOME FOLIAGE.

MESSRS. STANDISH AND NOBLE are now sending out the fine new Greenhouse Evergreen, WEINMANNIA TRICOSPERMA, which for beauty of foliage cannot be surpassed. It was exhibited at the Royal Botanic Society's Meeting in June last, and also at the Crystal Palace. From the report of the latter exhibition, the following brief description is condensed:—"You might pass off the leaves of this beautiful plant for the fronds of a handsome Fern. They are compound and pinnate, just like Fern leaves. I do not recollect, even among Mimosas, a plant with more beautiful leaves than this." We may add that it is of good habit, and easily cultivated; and from being a native of Valdivia, it may possibly be hardy.

Strong plants, 21*s.* each.

The Advertisers have just published a new Catalogue, which will be forwarded free by post on receipt of a penny stamp.

The Nurseries, Bagshot.—Aug. 11.

SUPERB NEW STRAWBERRIES,

Grown and Offered for Sale by

Omar Pacha (Ward's), 15*s.* per 25; 1*l.* 5*s.* per 50. Prince of Wales (Ingram's), 10*s.* per 100. Scarlet Nonpariel (Patterson's), 12*s.* per dozen; 2*l.* per 50. Sir Charles Napier (Smith's), 12*s.* per dozen; 1*l.* 10*s.* per 50. Admiral Dundas (Myatt's), 16*s.* per 25; 1*l.* 10*s.* per 50. Nimrod (Pince's), 10*s.* per 100 plants.

A SELECTION OF THE BEST OLDER STRAWBERRIES.—Black Prince, 4*s.*; British Queen, 4*s.*; Eleanor, 4*s.*; Old Pine, Goliah (Kitley's), 4*s.*; Bicton Pine (White's), 5*s.*; Keens' Seedling, true, 4*s.*; Old Roseberry, 4*s.* per 100 plants. Box included. The above prices will be reduced whenever a reduction is made by the raisers. A descriptive Circular of the above sent on application. A Post Office Order payable at Yarm, Yorkshire, is requested with the order.

"SIR HARRY."—To this STRAWBERRY has been awarded at all the Horticultural Exhibitions the highest honours, where it has competed, namely:—

1854.—Chiswick, first class certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize.

1855.—Edgbaston Botanical Gardens, first prize, in pots (forced); Handsworth and Lozells, Hampstead Park, first prize (forced); Edgbaston Botanical Gardens, first prize—the Judges declared it the best Strawberry in every point on the table, superior to Keens' Seedling, Cremorne Seedling, British Queen, Mrs. Trollope, &c.; Lancaster, first prize, and pronounced by the Judges to be the finest and best tasted Berry in cultivation; Preston, first prize; Carlisle, first prize; Wolverhampton, first prize, and certificate of merit; Watford, first prize; Aylesbury Horticultural Society, first class certificate.

Plants are ready for sending out (not less than a score).

Prices:—100 plants, 4*l.*; 80, 3*l.* 13*s.* 6*d.*; 60, 2*l.* 16*s.*; 40, 1*l.* 18*s.*; and 20, 1*l.* Plants may be had in pots (not less than 10), at 2*s.* each.

Apply to Mr. Richard Underhill, Sir Harry's Road, Edgbaston, Birmingham. Each application to be accompanied with a Post Office Order (on Birmingham), to receive attention.

For the Cultivation of Strawberries, refer to Mr. Underhill's Treatise, which may be obtained from a Bookseller in every principal town, where also may be obtained a handsome Lithograph of a plant of "Sir Harry" in full bearing.

The Gardeners' Chronicle.

SATURDAY, AUGUST 11, 1855.

There is nothing in the valuable precepts upon Hyacinth growing on a large scale given the other day (see p. 483) which is not perfectly applicable to the smallest operation, if the principles that are involved are separated from the mere details of practice. Those principles are—1, never to use unsound bulbs; 2, to provide a rich, permeable, well-drained soil; 3, never to cover the bulb with soil; 4, not to expose the buds to light or warmth until roots are protruded in abundance; 5, not to keep the plants in the dark after the buds have made perceptible progress. Let us examine these maxims separately in their relations to growing Hyacinths in water.

1. The bulbs should be sound. The bulb of the Hyacinth consists for the most part of soft cells filled with organisable matter having a great tendency to run into a state of putrescence. This tendency is much increased by any wound or bruise, which enables water to pass freely among the soft tissues without being gradually imbibed through the sides of the cells, and altered by their vital force. It is further accelerated by the condition of the water itself, which in bad management acquires an offensive quality that increases any tendency to decay which may naturally exist in the parts it touches. Perfect soundness of the surface is the only guard against such accidents.

2. When water is employed instead of earth, permeability is secured, but little or nothing more. There is no drainage, that is to say no exchange of exhausted for fresh water, nor any ingredient presented to the roots equivalent to the ammonia, the phosphates, the carbonic acid, the alkaline matter, present in a soil composed of wholly decayed leaves and stable manure, loam and sand. All that is provided for feeding the Hyacinth is mere water containing a little carbonic acid, and perhaps some salt of lime. Such being the case, the Hyacinth, instead of being fed by the soil in which it grows, is mainly nourished by suckling itself. Nature stores up in this plant a soluble material called organisable matter, upon which leaves and flowers can subsist, just as bears are said to be supported in winter by absorbing the fat which they acquire in summer. The result of this artificial subsistence may be emaciated life, but must be anything rather than vigorous health. It would seem that we must ascribe to this circumstance in part, if not wholly, that weak, languid, drawn-up, pallid condition which is so usually characteristic of domestic Hyacinths fed upon water.

Drainage may be imitated by a diurnal removal and renewal of water; but with the glasses now in use it can only be effected by being poured off, for to take the roots out every day is to bend, bruise, or otherwise injure them. Were the glasses furnished with a tap at the bottom, or provided with a little siphon, it would be much more convenient: very frequent renewal of the water is at any rate necessary. The water itself should be impregnated with those nutritious ingredients which good Hyacinth soil always contains. Probably the best substance that could be provided would be pure guano water, prepared by thoroughly mixing an ounce of Peruvian guano with a pint of water, allowing it to stand for a couple of days, stirring it occasionally, and then, when perfectly clear, drawing it off carefully. A teaspoonful of this solution might be added to every glass, as often as the water is changed. A weak solution of phosphate of ammonia and carbonate of potash mixed in equal parts, might be substituted for the guano water; and it would be interesting to watch the difference in the effect produced by the two agents.

3. If a bulb is covered with water it will absorb it faster than it can decompose it; of which the inevitable consequence is disease or death. The parts to which Nature has limited the duty of suckling the leaves and flowers are the concave surface at the base of the bulb, and the roots as soon as they are formed. If other parts are brought into contact with water they also must absorb fluid to their own destruction; for plants, notwithstanding that they have a living principle like animals, possess no will of their own. They cannot refuse to take up what is presented to them, although their vital energy may be insufficient to enable them to assimilate it. Water then should be scarcely in contact with the lower part of the bulb; it is better indeed that a space of a quarter of an inch should be always left between them, for the vapour arising from water is enough for a bulb to feed upon until roots shall have been formed, and the powers of digestion called into full activity.

4. In all cases where plants behave as nature intends, the root, or its equivalent, appears before the leaves; we see it in seedling plants, we see it in cuttings and in layers, we see it in budded or grafted plants, where the cellular matter (callus) which binds the scion to the stock always precedes the appearance of leaves. The reason is obvious. It is necessary that the organ which is to feed a plant should precede the parts that are to be fed. If then, in the case of the Hyacinth, leaves and flowers are permitted to form before the roots have acquired their full power of action, the leaves and flowers must subsist upon the organisable matter contained in the bulb, not on that to be obtained from the water (or soil); and debility, deformity, or utter abortion are the result. Now the great stimulant of leaf development is light; the great antagonist of root development is light; therefore darkness is what should be provided for the Hyacinth in the beginning. This truth is pretty generally recognised, but is as generally misapplied. People think that if the roots are kept in darkness it signifies little what happens to the bud. But nature does not work in that manner, nor do Mr. Henderson's growers. The buds are buried as well as the roots. We have seen Hyacinth glasses carefully provided with worsted stockings, while the buds were left in the full glare of light, instead of being furnished with a good thick nightcap. Some of our readers will know what is meant without more particular explanation.

5. But if it is wrong to expose the bud of the Hyacinth to light until the roots are formed abundantly, it is quite as bad to withhold light after the roots are ready. As soon as the lower system is in full activity, the upper should be stimulated. At that time the neighbourhood of a window, especially an open one, if possible, where air is in the most free motion, should be selected for the residence of the Hyacinth by day—while at night it may be transferred to the coolest place in the house where frost gains no admission. A worse place than the mantelpiece cannot be selected, except to put the Hyacinth in when its flowers are formed and beginning to open. At that time the work of cultivation is over, and the plant may be transferred to the fair hands of those who are charged with the pleasant duty of making a sitting room as cheerful and beautiful as the open garden.

The time is evidently at hand when the true position of the Stanwick Nectarine among fruits of its kind will be determined beyond all cavil. When first ripened in this country its quality was admitted by some of the first judges, to whom the

duty of tasting it was confided, to be unapproached for richness of flavour. If we mistake not our own statement was that it ranked among Nectarines as the Greengage ranks among Plums.

When, however, other samples of the fruit, in another season, were sent from Stanwick they were declared to be, what in truth they were, no better than an Elruge, if so good. They were not properly ripened. Afterwards, when the fruit began to be borne by the trees propagated from the celebrated tree at Stanwick they were still found to be destitute of the high qualities first ascribed to the variety, and it was also discovered that the fruit was apt to crack before ripening.

Last year, however, rumours began to prevail that the fruit was getting more like its original state, and that cracking was not a necessary accompaniment of its maturation. And now the experience of Mr. M'Ewen, the Duke of Norfolk's skilful gardener at Arundel, has come to the support of the original reputation of the variety. He says it yet will realise the high expectations entertained of it; and we repeat that the specimens just sent from Arundel still show it to be among Nectarines what the Greengage is among Plums. To that description we adhere without reserve.

As to cracking, Mr. M'Ewen pooh poohs what is said about it, as he very well may. Stone fruits crack because they receive more water than they can digest or throw off by evaporation. There is no other cause whatever for the malady, unless the skin is dead, which is not the case with the beautiful and clear-skinned Stanwick. The remedy is less water and more heat, or both; the commonest sort of common sense tells that.

We therefore feel justified in reasserting the admirable quality of this variety, and in regarding it as a real Horticultural treasure. It has but one fault, that of requiring, when ripening, more heat than the inferior sorts found in everybody's garden.

Advices from Malaga announce the reappearance of the Vine Mildew. In 1853 it attacked the Muscatels or Raisin Grapes to such an extent, that in the case of one of the great growers there, only 14,000 boxes could be sent to the English market instead of 20,000, the usual quantity from his vineyards. In 1854 it left the Muscatels, or nearly so, and attacked the wine Grapes. We now learn that it has once more seized the Muscatels as well as others. What is very curious, the bunches of Grapes which touch the earth are free, *those alone being attacked which appear on the higher branches.* Of course, therefore, the trellised Vines have suffered most. Another remarkable fact is announced, namely, that the mildew now attacks the Grapes, leaving the foliage sound and healthy, whereas it formerly attacked the leaves first, and the Grapes at a later period.

NEW GARDEN FERNS.—No. III.

7. Davallia bullata, Wallich. Cat. No. 258. Hook — Sp. Fil. i., 169, t. 50 B.

Fronds ovately-deltoid, sub-membranaceous, tripinnate; lower pinnæ obliquely elongate-triangular acuminate; pinnules lanceolate oblong pinnatifid, the ultimate segments forming linear-acute falcato-incurved teeth, the inner side of which usually is occupied by the sori; involucres oblong cup-shaped; rhizome creeping, clothed with spreading subulate entire tawny scales, fronds articulated.

A very elegant small growing Fern, native of Nepal and Assam, introduced to Kew in 1852, and about the same time by Mr. Nuttall. We have also seen it in the collections of Mr. Veitch and Messrs. Henderson, probably all from the same source. It appears to be a deciduous species, the creeping rhizomes, clothed with

bright tawny subsquarrose subulate scales, being often if not always without fronds through the winter. The fronds are articulated with the rhizome; 9 inches to a foot high, bright green, submembranaceous, glabrous, deltoid, tripinnate, with the rachis winged throughout as is the upper part of the stipes; the lower primary pinnæ are sub-opposite, triangular-elongate acuminate; the pinnules lanceolate-oblong, deeply pinnatifid; the secondary pinnules oblong, with simple acute falcato-incurved teeth. The sori are solitary on the inner side of the falcate segments, and have short oblong cup-shaped truncate involucres. The fertile fronds are copiously bullate with oval swellings on the upper surface. It is sometimes called in gardens the Fox-tail Fern. A Fern very similar to this was imported from Java in 1853 by Messrs. Rollisson.

VEGETABLE PATHOLOGY.—No. LXXXIII.

349. Capsomania (*Bladder Plums*).—The curious affection described under this head is not confined to cultivated Plums; it is found also in Cherries, and is common on a species of Cerasus which occurs in the Himalayas, and which has in consequence been named Cerasus cornuta. A figure is given of it in *Gardeners' Chronicle*, 1850, p. 406, from a plant received from Yorkshire, and one other notice appears in our Journal* of the malady, which is, perhaps, not very unfrequent, though it has been little noticed by authors.

De Candolle speaks, in his memoir on the Leguminosæ, of a case which occurred in Chablais, and must have closely resembled that figured above, in which the transformed fruit assumes somewhat the form of a pod. No notice, as far as I have observed, is taken of it by Loudon.

350. Though a mere matter of curiosity or speculation amongst ourselves, the disease is so frequent in some parts of North America as to make the Plum scarcely worth cultivating, and it is from a memoir of Dr. Robb, in the 3d volume of Hooker's "Journal of Botany," p. 91,† tab. iv., that I extract the following information: The Plum is extensively planted in New Brunswick, but seldom bears a crop in consequence of this disease. Before or soon after the fall of the blossom the ovary acquires a greenish yellow tint and becomes soft and flabby; it, however, increases rapidly in size, becomes darker, and somewhat ruddy, and at the end of two or three weeks is as large or larger than a ripe Walnut, insomuch that on a casual glance the tree seems loaded with ripe Apricots; on trial it is perfectly insipid and tasteless. The fruit in general as soon as it has acquired its full size is infested with a green mould, in all probability Cladosporium herbarum, soon becoming black and shrivelled, so that at the end of a few weeks from the time of flowering the whole is rotten and decomposed. The flowers appear about the beginning of June, and before August there is hardly a Plum to be seen. Sometimes, however, a portion of the fruit advances to perfection, and occasionally of two ovaries proceeding from the same common point one assumes its normal form, size, and condition, while the other is enlarged and inflated. The form of the diseased ovaries on the same tree varies greatly, being sometimes perfectly globose, sometimes depressed, sometimes elongated, and even pod-shaped.

351. The structure when closely examined is extremely curious. The fruit, external to the ovules in its ordinary condition, consists of three parts, the exocarp, sarcocarp, and endocarp; of which the first forms the cuticle, the second the flesh, and the third the stone of the perfect Plum. Of these the first is the least altered; it, however, loses its even surface, and becomes wrinkled, and instead of putting on red or purple tints assumes a decided yellow. The sarcocarp has lost almost entirely its fleshy condition, presenting the loose and dry cellular tissues of an ordinary leaf, with strong radiating and anastomosing bundles of vascular tissue, of which the two largest correspond with the placenta and the external suture. The endocarp seems at first sight entirely deficient, but close examination shows that the ovuliform body attached to the placenta is, in fact, the endocarp greatly contracted and separated entirely from the sarcocarp at an early stage of growth, in consequence of the more rapid development of the latter, except at the single point of attachment. It is in fact, instead of a stone, a membranous sac within which are seen springing equally from the placenta one or two ovules, each of which presents three membranes, the innermost of which is filled with a watery pulp without a trace of embryo. When two ovules are present one is usually smaller than the other.

352. The cause of this extraordinary change is at present extremely obscure. It has been supposed to be due to the action of some aphis or thrips, but in many cases no insects are observed about the diseased fruit, or any trace of puncture. The occurrence, too, of the disease in three such remote quarters of the globe is also against its insect origin. Dr. Robb is inclined to think that it is due to the changeable weather of May and June, which is the rainy season of New Brunswick, when the air, cooled by the melting ice and snow, is subject to the rays of an already powerful sun. This, however, like most climatic theories, does not rest upon a series of accurate observations, without which they can be considered merely as suggestive of what is possible. Where isolated observations are made, we have often two statements, directly contrary to each other, brought forward in explanation of the same fact, as in the Rose disease described in our last article. The inhabitants of New Brunswick believe that lime water is a specific, but this wants confirmation. *M. J. B.*

* See *Gardeners' Chronicle*, 1843, p. 819, where an abstract is given of a paper by Dr. Harris, of Cambridge, Massachusetts, in *Hovey's Magazine*.

† Erroneously printed p. 99.

GOOSEBERRY CATERPILLAR.

The article upon the Economy of the Gooseberry Caterpillar, published in p. 517, contains one or two observations which require notice, as it seems to me that improper deductions have been drawn in these cases from insufficient data. It is certain that the eggs of this pest are deposited on the ribs of the leaves. That a number of caterpillars were hatched without your correspondent having discovered the eggs, is no proof that the caterpillars were not produced in the ordinary way, or that they were brought by the wind, which one might almost infer was the opinion of the writer.

Again, the circumstances mentioned in the third paragraph prove that the writer is not a sufficiently close observer. He found the cast skins of the caterpillars on the surface, and yet the caterpillars themselves had disappeared, he knows not how. If he had taken the trouble to break up some of the little lumps of what he supposed to be mould, he would, doubtless, have found a nicely-formed oval cell in the middle of the mass, within which he would either have found the curled up caterpillar or the pupa itself. The depth at which the caterpillars burrow doubtless varies according to the nature and condition of the soil at the time.

The practical result of the preceding remarks is, 1st, to enforce the necessity of removing the soil under the Gooseberry bushes as soon after the caterpillars have entered the ground as possible; and 2d, to collect every female (this sex being especially distinguishable by its bright yellow body), as soon as ever they make their appearance on the wing. My own garden has this year been almost entirely free from the pest, although my neighbours' trees have been stripped of their leaves, by the precautions I took—1st, in collecting the females in the middle of April, as stated in this Journal at that time; and, 2d, of looking carefully over the trees as soon as I saw that a little gnawing of the leaves had commenced, and destroying the few caterpillars then found. *J. O. Westwood.*

Home Correspondence.

Peas.—I fully agree with your remarks (see Gardeners' Memoranda, p. 520) in regard to the earliness of Sangster's No. 1 Pea, as I have proved it to be the earliest of which I have any knowledge. I speak assuredly, having tried most of the early kinds in cultivation. This season I sowed the Pea in question more than a fortnight after Warner's Early Emperor, and No. 1 was in first by a week. I question, however, if it is at all times, and in all cases, obtained true to name, as I have seen Peas grown for it which have been about as much like it as Bishop's Long-podded Dwarf is like the Tall Marrows. I am so perfectly satisfied with those I have being true that I have harvested sufficient for my own use next season. I may state that I pursue precisely the same mode of culture in the early sowings as that which was recommended in your pages some two or three years ago, viz., sowing in pots and turning them out entire; this certainly is the most advantageous plan that can possibly be

adopted, and can be done with little trouble and great economy. I did not sow my first crop this spring until the 27th of the second month—in fact, about a day before the 1st of March, and had the satisfaction in gathering Peas long before some of my neighbours whose seed had been deposited in the open garden some months previous to mine being sown. I am of opinion that we shall not see in future writers on modern gardening in their calenderal directions advising their readers to sow Peas in November, when the earth is every day losing heat by radiation; this system, with many others, is being very beneficially repudiated by all those who have and are taking steps in the right direction. For the earliest crop of Peas it is not necessary, when sown in pots, that they should be turned out before the end of March or the beginning of April. In 1854 I picked Peas the third week in May, which were sown on the 14th of February, and turned out the end of March; these Peas were in bloom when we had that memorable frost on the 24th and 25th April, but received no injury, being protected by a very high wall. Generally speaking I cultivate only about three or four sorts; this season I have grown the following—Sangster's No. 1, Early Emperor, Fairbeard's Surprise, do. Champion of England, and British Queen Peas; in my opinion of very first-rate excellence, and all that are really necessary to cultivate, let the consumption be what it may. *Geo. Fry, Lee, Kent.*

Great Tree of Upsala.—In looking over the curious old book "Olaus Magnus de Gentibus Septentrionalibus" I found the following passage (Book iii., cap 5) describing the splendid Pagan temple formerly standing at Upsala, at Sweden:—"Astabat ejus foribus arbor ingens ignoti generis, patulis diffusa ramis, æstate et hyeme juxta virens, non tamen de earum arborum genere quæ suapte naturâ, ut laurus, oliva, palma, et myrtus virere videntur: quin in Aquilone nulla unquam oliva vel laurus nisi in parvo frutice pro spectaculo vastenis exurgere visa est. Erat que fons huic templo propinquus qui scaturiit in locum sacrificiorum, &c." Now what tree could this have been? Not a Yew probably, as that would not be "*ignoti generis*." It would however, seem likely that our heathen ancestors who colonised England from the north kept up the tradition of this sacred tree, and from hence arose the custom of their christianised descendants of planting a Yew close to country churches. If not a Yew, could not the great tree of Upsala have been a Cedar of Lebanon? Whatever it was, it was probably raised from a cone brought by some of the Scythian migratory tribes from Russia or Tartary, as we know the priests or conjurors of savage tribes use all sorts of things of that sort in their ceremonies, and a cone would keep its vitality for years. Could it not even have been a Deodar? It would be curious to ascertain if any trees of that sort have been in existence in Sweden. Perhaps the severity of the climate prevented any ripening of more cones. *Antiquary.*

Gooseberry Caterpillar.—I can vouch for the following receipt being an infallible remedy for this pest, having applied it for 30 years and never known it fail. Make a strong decoction of Digitalis (Foxglove), and syringe the leaves of the tree affected with a common Mac Dougal's syringe or a rosed watering can; the former is preferable, particularly if it is an inverted one, so that the liquid may get under the leaves, as then there will be less chance of the rain washing it off. A dry day must, of course, be chosen for the application, and in two days after the grub will be found destroyed, the fruit remaining perfectly uninjured. The decoction is made by roughly gathering the Foxgloves, leaves and flowers indiscriminately, and boiling them a quarter of an hour in water. One dressing suffices for the year. *R. Underhill, Sir Harry's Road, Edgbaston, Birmingham.*——I have practised the following plan of keeping my bushes clean for these last eight years with complete success. The first year I commenced growing berries I was mortified to find the leaves of my trees eaten off by caterpillars, and the crop of fruit ruined. I therefore determined to experiment upon my leafless trees, and despite the remonstrances of a friend, I ordered a quantity of gas lime fresh from the purifier's, and spread upon the surface of the soil underneath the trees, all round as far as the branches extended; this was covered over with a thick coating of stable manure. The following summer I had the satisfaction to find my trees push strong healthy shoots, and also produce an excellent crop. I have continued this practice every alternate autumn, and have not been troubled with a caterpillar since; there were a few green flies upon the extreme end of the new shoots or branches this spring, but they were nipped off as they appeared, and I have now, for the eighth season, a crop of fruit as fine, and trees as healthy and clean as any in the kingdom. *T. W. M., Ashton-under-Lyne.*——I cannot throw any light upon the history of the Gooseberry caterpillar, but I can tell you how I have cleared bushes which swarmed with them. I cut a slit half way across a linen cloth, and drew the cloth under each bush to the end of the slit; then placing a forked stick against the stem, I suddenly gave a violent shake, and the caterpillars fell in showers, and were removed and destroyed. I proceeded thus from bush to bush, and by the time I had gone round the remaining caterpillars had loosed the hold which they had taken after the shake, and another shower fell by the second application of the fork. In two or three rounds I cleared my bushes, or so nearly cleared them that the ravages were afterwards inconsiderable. This is merely a simplification of Forsyth's plan of first laying sifted quicklime under the bushes, and then shaking down the caterpillars, to be followed by sprinkling lime on the bushes for the destruction of those which remain, but with the certain result of destroying the fruit also, or the leaves at any rate. *J. G., Bury St. Edmunds.*——I managed my Gooseberry trees this season as follows: I came to this place in September last, and found all the trees in question divested of their leaves and looking winterly, even the very shoots were wrinkled up to almost nothing. I pruned them in winter as usual, and in frosty weather gave them a good dressing with rotten manure, which I spread over the surface of the ground, and there let it remain for a few days, until the frost had gone through the manure and killed all the insects; then one frosty morning I began to carefully dig the manure in with a fork under the trees, so as not to injure the roots, say only just to bury the manure, and after that we had a severe frost, which I imagine completely destroyed all larvæ; after the frost the ground was gently moved over again and left loosely until spring, and the result has been that I have had all my trees bud and leaf with all the vigour I could desire, and they were loaded with blossoms, which had it not been for the frost in May would have produced a heavy crop. In the middle of the trees, however, I had good fruit, owing doubtless to the protection afforded them by the outside leaves and shoots. I have never seen a caterpillar on any one of them, and at the present time my trees are covered with foliage, both green and healthy, and the shoots are as strong and firm as I could desire. I shall of course try the same plan again next winter. *W. Hawkins, Thorney Abbey.*

Abronia umbellata (*see p.* 520).—In May last I purchased from Messrs. Veitch, of Exeter, several plants of this flower, which were immediately put into a bed in the flower garden, prepared as they recommended with plenty of sand, and they are now coming into profuse flower. *C. J. B., Abbotsley, Devon.*

Ventilating and Heating Plant-houses.—Will any of your correspondents kindly inform me whether there is any generally approved rule as to the proportion of superficial feet of ingress and egress ventilation respectively to the cubic contents of a span-roofed plant-house heated by hot-water pipes? I should also feel obliged if any of your subscribers would inform me what proportion the heating surface of the boiler ought to bear to the radiating surface of the pipes to be supplied in the hot-water apparatus for a span-roofed plant-house? In other words, what ought to be the size of a saddle-shaped boiler to heat about 650 feet of 4-inch pipes for a plant-house? *A Subscriber.* [You should consult Hood's work on Warming and Ventilating.]

Transplanting Evergreens, &c.—I think we must admit that all outdoor planting is best done early in October. Evergreens can, however, be successfully planted at any season by trenching, watering, raising, and doing the business properly, but this very winter and spring when frost was on the ground and the winds dry and boisterous for a long continuance, I went on with my work, and out of 3000 and odd shrubs planted in loose trenched ground I hardly think 20 have died, and many of them were very indifferent plants, as the nurserymen in my neighbourhood could not make out for me the quantity I wanted of the right size, health, and vigour. My plantations border on the sea-coast, but tolerably sheltered, and notwithstanding the March cutting winds and the hard winter, I find very few things have been injured. The plants that have been killed are the Aralia spinosa and some very fine specimen beds of Veronica. An American Aloe is now as green and healthy as it has been for many years out of doors, without any protection. None of the Pines or Cupressuses have been hurt. The Myrtles and Bays were much scorched, but they are all coming in full foliage again. Fuchsias are all right, as are all the Spiræas and Ferns, some of which are called half-hardy only. The Escallonia macrantha is worth naming, from its beauty, hardihood, and vigorous growth, seeming not to heed even a Crimean winter. Do what I will, Rhododendrons here just live, but nothing more. The reason given is that our soil lies on a limestone formation. *Anon., Rhyl.*——I quite agree with "Quercus" that as a general rule no particular day can be set down for planting on; still I think that those conversant with extensive planting will allow that under ordinary circumstances August, September, and October, are the best months for the purpose; for instance, who could wish for better weather than the present for planting Laurels, Hollies, Yews, &c., and he must be old in the profession who can remember a worse period than last year at this time, not only for planting but what is equally important, lifting. This is a branch in general wretchedly managed; indeed it is almost impossible to find a labourer with sufficient knowledge to lift with care and expedition. I had occasion to purchase a large quantity of valuable specimens last year, and being anxious for them to succeed I had them lifted at my own expense, and sent a man highly recommended to superintend the operation; however, the first waggon load that arrived led me to anticipate that they would not succeed, and now they are in the rubbish heap, while thousands planted at the same time around them that were better treated have done admirably. Where the ground is not adhesive I would strongly advise puddling. Half-a-dozen pots of water thrown into the pit, and mixed up well with the earth, so that the roots of the plant sink quite down into it, and a potful or two applied after it is partially covered up, are worth a dozen waterings afterwards. One word more. Where landscape gardeners, and especially contractors, are employed, I would advise proprietors not to enforce work to be done at this season that can be done equally well at a later period, so that there may be no excuse for losing an hour, for time in such an operation is important. *D. Ferguson, Stowe, Buckingham.*

Camellias.—Having experienced a failure in the blooming of my Camellias last season, I am anxious to avoid a repetition of the occurrence if possible, and, consequently, I shall feel obliged if any of your correspondents can point out the source whence the failure arose. The facts are just these:—The buds were firmly set, and did well up to the time of their showing colour, or, in fact, just as they ought to commence expanding, when they were seized with a kind of rot in the eye or heart of the flower, and in a day or two dropped off, the flowers not having been half developed. I may mention that a friend of mine has been quite as unsuccessful this season with his Roses, and under circumstances precisely the same as in my case. *C. P. W., Penzance.* [Is not cold and damp, and want of vigour in your plants, probably from their roots being in bad condition, the cause of the evil of which you complain?]

How to Cut Hedges.—Having noticed a paragraph in your Paper of the 28th ult., headed as above, I was in hopes some one would have replied to it before now, and denied that we northerns stands in need of your correspondent's advice. He probably, however, resides further north than it has been my lot to travel, or at all events not so far south as Yorkshire, or he would not say that nearly all the hedges he has seen are clipped square. As far as I have travelled north (Durham being the farthest) I have neither seen hedges square nor clipped to any extent. I own I have occasionally seen a cottager have a fancy for his garden hedge being clipped square or wall-shaped; but I am surprised to hear of any one adopting that system generally, as I should have thought that they would have been aware of the much better and cheaper plan of having their hedges slashed in the form of half an oval, or half round, as many have them (using a two-handed hooked slasher), or what is a great deal better, having them slashed pyramidally wedge-shaped, with a light straight slasher, the best of which I believe are made by Harrison, of Dunse, in Scotland. *A Yorkshireman.*

Rain Fall in July.—On Saturday afternoon, July 28, soon after 3 o'clock, we had a very remarkable fall of rain. The shower did not last more than three-quarters of an hour, but in that short space of time 1.550 of rain fell, or about 630 hogsheads per acre. There was a single clap of thunder and a few large hailstones, and the storm was very limited in extent. *Henry Doubleday, Epping, Essex.*——It is curious that at this place the fall of rain in July has been very small, though there has been rain enough in the neighbourhood. Our springs are still exceedingly low, and there has not been the slightest flood anywhere for miles around. *M. J. B., King's Cliffe, Wansford, Northamptonshire.*

Shaddocks and Forbidden Fruit.—It may perhaps be interesting to know that plants of these may be easily raised from the fruit to be purchased in the London shops. Two years ago I sowed seeds procured in that way. Out of a large number of plants I saved six of each kind, which stood the severe cold of last winter in a greenhouse (not heated), and I have now two plants of Forbidden fruit with fruit well set, and all the others are strong and healthy. *C. J. B., Abbotsley, Devon.*

Societies.

Botanical of Edinburgh, *July* 12.—The President in the chair.—1. On the Introduction of the Cinchona Tree into India, by Dr. Anderson. 2. On the presence of Diatomaceæ, Phytolitharia, and Sponge Spicules, in Soils which support Vegetation, by Dr. Gregory. Ehrenberg, in his late work, "Mikrogeologie," has stated that in specimens of soils from all parts of the world, he has found many microscopic organisms; he divides these into Siliceous and Calcareous, the former including Diatomaceæ, Phytolitharia and Polycystina, as well as Sponge Spicules, the latter minute Mollusks and other shells. The present observations are confined to the silicious organisms, and among these, chiefly to the Diatomaceæ, with Phytolitharia, and Sponge Spicules, the soils examined being such as are connected with fresh water, in which the Polycystina do not occur. Many of Ehrenberg's observations were made on the small portions of soil found adhering to dried plants in herbaria, and I requested Professor Balfour to supply me with such portions of soil if possible. By his kindness I obtained upwards of 60 such specimens, almost all of which were of very small bulk, on an average not exceeding that of a pinch of snuff, and sometimes less. Of these a certain number consisted chiefly of earth, with some half decayed vegetable matter, and many contained hardly anything but decaying vegetable matter, with a mere trace of earth. Of course, the latter are not fair specimens of soil, but I have subjected all to the same treatment, namely, boiling with nitro-muriatic acid, washing, straining through gauze, and examining the fine insoluble residue. This, of course, contained all the siliceous matter present, but it also contained much organic matter, of a brown or red colour, insoluble in acids, which, if necessary, might be destroyed by ignition, when it would leave a trifling ash. In every case I found Diatomaceæ in the residue, as well as Phytolitharia. Sponge spicules, apparently of fresh-

water sponges, were less frequent, but occurred in many. In a few cases, where the acid caused effervescence, there was calcareous matter present, but in most, this was not the case. Of course, in those cases in which the proportion of earth was small, the residue consisted chiefly of the insoluble organic matter, through which, however, Diatoms and Phytolitharia were scattered, in greater or smaller proportion. In the cases where the proportion of earth was larger, the residue was much richer in Diatoms and Phytolitharia, but almost always contained also the dark insoluble organic matter. In several, the proportion of Diatoms in the residue was so large, that it had the appearance of a regular Diatomaceous gathering, after boiling with acids. The most remarkable soils in this respect were one from the Sandwich Islands, one from Lebanon, one from the roots of a German Moss, and one from Ailsa Craig. It is to be noticed, however, that Diatomaceæ were found in every case, without exception, and that in all their proportion to the whole non-calcareous earthy residue was considerable, and often large. In many of those where the proportion of earth was smallest, there was no siliceous matter in the residue, except Diatomaceæ and Phytolitharia. The soils examined were from various and distant localities; there were about 20 from the Andes, several from Brazil and other parts of South America, a few from North America, a few from the West Indies, one from the Sandwich Islands, one from New Zealand, a few from India, one from Lebanon, a good many from Germany, some from France, a few from Spain, and some from Britain. The great majority of the species of Diatoms in all these were found to coincide with our British forms, but a good many species occurred in the exotic soils, which have not yet been found in Britain, and most of these not even in Europe, but which have been figured by Bailey, Ehrenberg, Kützing, Rabenhorst, &c. A good many were observed, which, so far as I know at present, have not yet been figured or described. Lastly, a certain number of species, lately found by Smith, Greville, and others, as well as by myself in Britain, and some of which are scarce, have occurred in these exotic soils. 3. On the Effects of the Severe Frost of last winter on Plants in the neighbourhood of Sligo, by the Right Hon. John Wynne, of Haslewood. The following facts indicate the severity of the frost:—First. The adjoining lake was frozen across, so as to bear skating for about one-third of its length for about a fortnight—a circumstance which never occurred in my recollection, and I believe only once during the lifetime of my father, who lived to be 85, and spoke of his having once skated across the lake, which we did several times this last season. Secondly. The number of birds killed by it was very great, especially sea birds—curlews and seagulls. After the thaw the sea-shore was covered with dead sea fowl. The thermometer at Markree Observatory, only six miles from this, and equally near the sea, on the 12th of February stood at 13.2 Fahrenheit, and on the 13th 17.6; on the 17th, 17.2; on the 18th, 15. There was no snow here during the continuance of the frost—only about 2 inches fell on the first day of the thaw, so that the plants were exposed to its full severity. Some days after its commencement I had the roots of the plants marked * covered with sawdust, but by no means soon enough. Plants killed—Erica arborea, Erica ciliaris, growing in bog; same very slightly injured in garden; Phyllodoce cærulea, Rhododendron altaclerense, Adiantum capillus Veneris, from Arran; *Davallia canariensis. This Fern has been for years in the rockery, covered during frost with a piece of calico. Plants much injured: Edwardsia tetraptera, old plants on west wall; E. microphylla, old plants on north wall; Laurus nobilis, *Myrtus communis, on wall, both narrow and broad-leaved; Ulex europæus in some places, not the least in others; Calluna vulgaris, in bog; *Abutilon striatum on east wall, out four or five years; Dabœcia polifolia, Verbena triphylla, *Aspidium longifolium, covered with calico. Slightly injured as to the leaves: Arbutus Unedo, much injured a few miles off; Photinia serrulata, both on wall and standard very slightly; Viburnum Tinus, some plants close to others which were much injured received no injury; *Ceanothus azureus on south wall. Uninjured: Fuchsia globosa major, on east wall; Magnolia grandiflora, on south wall; M. tripetala, standard; Rhododendron arboreum, Rhodothamnus Chamæcistus, Arbutus Andrachne, Olea excelsa, standard, sheltered; Daphne pontica, Pæonia Moutan, Pawlovnia imperialis, Erica mediterranea, also Irish variety; Cedrus Deodara, Araucaria imbricata, Cupressus tomentosa (*sic*), Taxodium sempervirens, Pinus canariensis, Abies Webbiana, A. cephalonica, Cryptomeria japonica, Quercus coccifera, Juniperus bermudiana, Buddlea globosa, Cistus ladaniferus, Garrya elliptica, Woodwardia radicans, covered with calico, as it has been for some years; Trichomanes brevisetum, Pinguicula grandiflora, Anomotheca cruenta, Mimulus moschatus.

Pomological, *August* 6.—Anniversary. Mr. Rivers in the chair. A report on the state of the Society's finances was read, from which it appeared that after all expenses were paid there remained 27*l.*, together with some outstanding debts due to the Society, in the hands of the treasurer. Officers for the ensuing year were then nominated, when Sir Joseph Paxton, M.P., was elected President; Mr. Davidson, Acting Secretary, at a small salary; and Mr. Taylor (of Messrs. Webber's), Treasurer, vice Mr. Spencer, retired. Amongst the more important fruits examined on this occasion were Stockwood Golden Hamburgh Grape, a sort first exhibited at the Horticultural Society's last July meeting, when it gained a Medal, as a valuable novelty. This opinion was now confirmed, it being regarded as a valuable acquisition to White Grapes, of which with the exception of Muscats, it was pronounced to be the best; also fruits of the Stanwick and Elruge Nectarines, from Arundel Castle, both excellent of their kinds; and a good looking juicy sub-acid Cherry from Mr. Rivers, considered to be valuable for its lateness.

Notices of Books.

The Philosophy of Reproduction. By R. J. Mann, M.D. Small 12mo. Longmans, pp. 160.

It is long since we met with a work in which the mysteries of nature have been more happily and intelligibly revealed. Dr. Mann's style of conveying the facts of high science in familar language is a model not only of skilful generalisation, but of pure English, undefiled by fearful Greek and Latin stains. That reader must be very dull of apprehension who fails to follow his lucid narrative even into the deepest depths of scientific revelation. We only regret that he never gives an authority for his statements, which necessarily rest mainly upon the researches of others, and which we certainly cannot in every case affirm to be susceptible of proof.

Without, then, professing to endorse all which this most instructive and entertaining volume relates, we are justified in saying that it is a lucid explanation of the opinions at present entertained by philosophers concerning what were once thought to be the impenetrable secrets of reproduction among living things, whether by eggs, seed, or other contrivances. From the animalcules that only microscopical eyes have ever looked upon, up to man, the most perfect of created beings, the chain of analogies is completed, as it also is between the green scum that floats upon our inland waters and the Pine of a thousand years that covers them with its shadow. In all these widely different forms the exact analogy of reproductive phænomena is sketched (for we have only a sketch) with very remarkable skill.

In explaining these curious operations, Dr. Mann takes as his point of departure Carpenter's happy idea of dividing all living matter into two forms, the Zöon and the Zöoid:—

"Each entire generation is in his nomenclature a zöon (*zoon*, Greek for animal); and every separate vesicle that forms an individual in this zöon is a zöoid. Thus, suppose, for instance, that one active vesicle of the yeast plant were dropped alone into a tun of sweet wort ready for fermentation, and were there to bud and multiply until a hundred millions of similar vesicles had been produced, each of these hundred millions would be one of Dr. Carpenter's zöoids; but all the vesicles contained at any one time in the tun would be a zöon. This is a very important generalisation, on account of the facility it affords for explaining what happens when complex instead of simple structures of organisation are concerned.

"Where the lowest and rudest kinds of vesicular life are alone in question, each new generation is cast off as rapidly as it is produced, and thus the entire zöon is widely scattered over the face of the earth. This, however, only happens with such rudimentary structures as the monad animalcules and many of the diatoms. In all other instances, the zöoid vesicles that are formed from one parent show more or less of a tendency to cling together. It has been stated that the vesicles of the yeast plant hang together in strings so long as the fermentation of the liquid in which they are developed continues. Many diatoms form chains after a similar fashion, sometimes holding together by the corners of their quadrangular frustules, at other times constituting staircases and jointed bars of very singular outline. In the higher developments of animal life, all the zöoid generation produced from a parent vesicle is retained in one skin. None are allowed to be scattered abroad until their work in the individual economy is finished. Each animal is therefore in itself one zöon of Dr. Carpenter. In the highly developed plants, the zöoids of a single generation are also attached together; but in this case subordinate clusters are capable of being removed from the general mass, and yet of possessing the power of individual life and further growth. Some plants propagate themselves by throwing off subordinate zöoid clusters of this kind; and the clusters are then called bulbs. Nearly every kind of perennial shrub and tree may be artificially multiplied after a similar fashion, by removing analogous zöoid clusters as cuttings. Cuttings are only artificially-produced bulbs."

It would be a vain attempt to show the manner in which this principle is applied, unless we were able to reproduce the woodcuts (admirable ones, by the way) with which the little volume is abundantly illustrated. All we can do is to select a passage or two, tolerably complete in itself, which we hope will not only prove instructive but induce the reader to consult the work itself.

Everywhere the first warm breath of spring arouses into life countless myriads of minute plants, whose presence is only ascertained, in the absence of the microscope, by the green colour they impart to stagnant water. They are thus described:—

"There is a little water plant known under the learned name of the Protococcus pluvialis ('primeval grain of the rain'), which consists of nothing more than a thin filmy wall rolled round into a globular form, and containing in its cavity a thick liquid dotted over with granules. If one of these plants is examined carefully by the microscope while floating in water, the granules will be seen to group themselves together under the eye until very soon a number of cell-like bodies have been formed in the interior of the primary vesicle. Commonly these new bodies mature into globular vesicles like their parent, burst its walls, and escape into the water to begin developing a like progeny in their interiors in turn. When this takes place, the occurrence is simply an illustration of one of the modes of cell multiplication already described. But sometimes a very curious change is made in these ordinary proceedings. The contained cells become oval or pear-shaped, instead of being globular, and a pair of delicate cilia or hairs are developed at one end. So soon as these cilia are perfected they begin to wave backwards and forwards with incessant motion, and create a great turmoil in the little chamber where all was so calm before. At length the parent vesicle, unable to stand this internal bustle any longer, gives way before it, and bursts, and its restless progeny swarm away into the open water, vigorously rowed by the vibrations of their ciliary oars. When these ciliated cells are observed soon after swarming they look very much like infusorial animalcules. Soon, however, a change comes over the spirit of the animated dream. The elongated vesicle plumps up into a globular outline, its oars drop off, and it is a motionless sphere—a simple unicellular plant in every particular like to its parent. Its day of roving is past, and its period for settling come. The vibratile oars are merely a temporary expedient provided for enabling the 'primeval grain' to flit to some distant locality, in order that it may deposit there its vital germs. This curious proceeding is a plan expressly provided for diffusing the race of this vegetable monad through the waters. Science, ever so free with names, has found a very appropriate appellation for these ciliated vesicles. They look like little animals, while performing their rapid evolutions in the water, and they obviously answer the purpose of seeds, which, wafted by the wind, transport the parent species to remote situations. They are hence termed 'animal seeds,' or, in the Greek form, 'zoospores' (from *zoon*, an animal, and *speiro*, to sow). Sometimes the first progeny of zoospores produces a brood like to themselves, instead of losing their oars and settling down. Then it is this second zoospore generation that matures into the globular condition, and becomes the staid and stationary creature."

In another place we have the following graphic explanation of the reproduction of the green-fly, blight, or aphis.

"One of the best known of the blighting parasites is the aphis of the Rose. There are few persons who have not, at some chance time or other, been annoyed by seeing the stalk of one of their favourite flowers of June completely ensheathed by a covering of little green viscid insects. Each of these unwelcome visitants of the Rose possesses a round, plump body, supported on six slender legs, and furnished with a pair of respectable feelers projecting out in front, and two oddly-shaped spikes protruding behind. The plump green body is crammed to overflowing with sap extracted from the plant. Pliny's 'saliva of the stars,' and the 'honey-dew' of later authorities, is merely the superabundance of this stolen matter overflowing from the gorged reservoirs into which it has been stowed. The aphis is marked by the extreme of philosophic indifference to surrounding things. It seems to live only to eat and to be eaten, and not quite to have made up its own mind as to which is the better fate of the two. It takes no trouble, in a general way, to conceal its presence, or even to shelter its body from passing inclemency of weather. Sunshine and storm are alike in its eyes; and while the emptied carcases of its neighbours are being piled up around its resting-place by some one of its numerous enemies, it goes on tapping the leaf beneath it, and quaffing the delicious juice, until its turn has come. Ladybirds and the grubs of the lacewing flies may often be seen sucking the juicy aphides as boys do ripe Gooseberries.

"Through the early summer the colonies of the aphides are wingless; but later in the season individuals appear in their grazing flocks, who have magnificent wings stuck rigidly and proudly up from their backs. Now these winged aphides are, like the winged ants, the males and females of the species. The individuals that form the great bulk of the colonies, and that are wingless, are not, however, neuters, as is the case with the ants; they are all females. No gentlemen ever make their appearance among them until quite the end of the summer. Yet those females go on producing generation after generation of forms of like organisation to themselves. This is the surprising peculiarity in the history under consideration. The fertilised germ-vesicle of the aphis is deposited as an ovum by one of the winged females at the close of the summer in the snug nook formed by the union of a Rose leaf with its stem. This egg is hatched by the returning warmth of spring; and out of it there then comes a wingless, six-footed grub, which is not only a grub, but also a female grub, and a wondrously productive one to boot: for after a few days she gives birth to eight wingless, six-footed creatures like to herself. Each of these is also a productive female, as well as a grub, and in her turn soon gives birth to another generation of eight forlorn grubs, who thus, strange to say, are not only fatherless, but really must have been fatherless, and have been in existence, in a physiological sense, even before their mother was born. The only paternal influence they received must have been handed down to them through

the primeval egg that produced their own grand-parent. This singular process of multiplication goes on, generation after generation, in favourable seasons up to the tenth or eleventh successive aphis brood; so that, if the ranks of the thriving race were not thinned by the attacks of depredators, the descendants of a single first-parent might number within one season ten thousand million of millions, and this too without any renewal of the fertilising influence."

"This extraordinary production of successive generations of distinct living creatures from one maternal parent, without any renewal of fertilisation for any of the broods, has been designated 'Parthenogenesis' (Virgin-birth) by Professor Owen."

After referring to a description, here omitted, the author proceeds as follows:—

"In this way, therefore, the analogy with the operations in the vegetable kingdom is made complete. Each of the grubs of the intermediate broods is really an aphis bud, rather than a perfect female, and is protruded from the parental body as leaf buds are pushed forth from the stems of plants. The early generations of the aphis are budded rather than born, each bud separating from the interior masses of the producing structure, and finding its way into external space through a channel left for the purpose in the organisation. The term virgin-birth might perhaps be advantageously exchanged for animal gemmation (animal budding). In growing trees young buds, that are the offspring of some primeval germ-fertilisation, produce successive generations of bodies like to themselves, without the intervention of any fresh fertilising influence; but after a time stamen and ovule-bearing flowers are formed, instead of more generations of ordinary branch-making buds. Then the matured seeds separate from the parent structure and fall to the ground, or are borne away to distant regions by wings (in this case the wings of the wind), in order that the race may be maintained in dormant existence through the winter's cold, and be subsequently again recalled into activity far and wide. But the wingless grubs of the aphis are scarcely more locomotive than the leaf-buds of a tree. So long as there remains the smallest drop of sap in the stalk or leaf on which they chance to be, they stick to their positions, unless forcibly driven from them. It only needs that a colony of them should be conceived to be bound together by a common investment of skin, as they lie in their lazy ranks, and that the new buds should continue to shoot from this connected mass without being separated from it, until the final generation of winged females and males are produced; and there is then before the imagination a picture of an aphis stem pushing forth its aphis buds, and at the appropriate season blossoming its special reproductive apparatus of aphis flowers. The wingless grubs are to the aphis colony precisely what the leaf-buds are to the perennial shrub or tree; and the winged and perfected insects are what the flowers and seeds are to the perennial tree. Each bears the same relation to, and performs the same office in, the general economy of the organisation to which it belongs, and on this account becomes as pleasant a spectacle to the physiological eye as it is a disagreeable one to the horticultural organ of vision."

Such being our opinion of Dr. Mann's very agreeable volume, we have no reluctance in pointing out little slips of the pen such as assigning to *different trees* of the Oak the property of bearing catkins and acorns, or the death of annual plants to the mere action of cold.

FLORICULTURE.

National Floricultural Society, *Aug.* 9.—Mr. W. Paul in the chair. At this meeting Hollyhocks formed, as was expected, the chief feature of attraction; but there were also beautiful exhibitions of cut Verbenas, Carnations, and Picotees, Dahlias, Balsams, Fuchsias, and other objects of interest. Of Hollyhocks Mr. Roake, gr. to E. Foster, Esq., of Clewer Manor, near Windsor, sent Mrs and Miss Ashley, Beauty of Cheshunt, Unique, Sulphur Queen, Comet, Pourpre de Tyre, Julia Roake, White Globe, and three Seedlings. In a collection from Mr. Turner, of Slough, we remarked very fine examples of Sir D. Wedderburn (improved), Mrs. Parsons (a Seedling), Little Gem, Standard (a salmon-coloured Seedling, to which a First Class Certificate was awarded), Lizzy, Pourpre de Tyre, Brennus, Lemonade, Unique, Eugenie, Beauty of Cheshunt and Argo, a Primrose seedling, to which a Certificate of Merit was awarded. The same grower had also three fine spikes of Criterion, Unique, and Emily. Mr. Bircham had a Certificate for Purple Perfection, a Hollyhock of good form, size, and substance, but deficient in guard petal. Mr. Parsons, of Welwyn, showed Bride, a promising creamy blush flower, but not in good condition. Mr. Chater also produced some cut blooms of Hollyhocks. Of Verbenas the best collection came from Mr. Lochner, who sent Lord Raglan, Empress, Mrs. Tysson, Reine d'Amazon, Hector, St. Margaret's, Queen, Mary Ann, Peter Dick, La Deesse, and two other French varieties. Mr. Weatherill, gr. to D. McNeill, Esq., who was second, had Vicomtesse de Balville, Brilliant de Vaise, Old Tom, Grandis, Eugenie, Mary, Cedo Nulli, Mrs. Woodruffe, Purple Defiance, Syuonie, Caliban, and Novelty. A third collection was furnished by Mr. Smith, of Hornsey, who had among others Urania, Lord Raglan, Hebe, Wonderful, and one or two promising seedlings. A First Class Certificate was awarded to Mr. Turner for Blue Bonnet, apparently a useful bedding variety. The Royal Nursery also furnished Premier, a pretty rosy crimson kind with a white eye, and Belle of the Village, a sort in the way of Mrs. D. Tysson. Of Picotees Mr. Turner sent Dr. Pitman, a very fine heavy red edged variety, to which a First Class Certificate was awarded; and Mrs. Lochner, also a heavy red edged Picotee, to which a Certificate was given. This was a well shaped and promising flower. A Certificate was awarded to Mr. Lochner for Angelina, a light rose edged kind of good form and breadth of petal. Mr. Turner received a certificate for Alma, a scarlet variegated Geranium, which looked as if it would make a good bedding kind. Mr. Smith, of Hornsey, had a Fuchsia in the way of Clapton Hero; Mr. Salter, of Hammersmith, a Phlox, for which he had a Certificate; and Messrs. E. G. Henderson some seedling Heaths, to two of which First Class Certificates were awarded. Messrs. Paul & Son had some cut Roses, whose beauty seemed to have been considerably impaired by the heavy rains we have lately had. Of Dahlias, Mr. Robinson sent Rachel Rawlings, Duke of Wellington, Eclipse, Essex, Triumph, Louisa Glossop, and Sir P. Pathurst. Mr. Turner had Beauty of Slough, Miss Burdett Coutts, Lilac King, Mr. Seldon, Robert Peace, and Sir P. Bathurst. Mr. Keynes also showed six blooms, among which were Duchess of Kent, Lord Raglan, Rachel Rawlings, &c. Of Fancy kinds, Mr. Turner sent Butterfly, Topsy, Laura Levington, Pigeon, and Comet. Among Mr. Keynes' flowers were Mrs. Spary, Admiration, and Baron Alderson, &c.: and Mr. Robinson had Motley, Miss Mathews, and Mrs. Heather. A Second Class Certificate was awarded to Miss Burdett Coutts (Turner), a salmon and brown flower of good form and substance, and a similar award was made to Mr Keynes for Lord Raglan, a buff variety, shaded with orange, and good in outline, but not very attractive in colour.

Miscellaneous.

The City of London Cemetery at Ilford.—This, under the control of the City of London Commissioners of Sewers, and occupying upwards of 90 acres, is progressing towards completion. The chapels, lodges, and other architectural matters are in a forward state. The turfing, roads, &c., are very far advanced, and the consecration is expected to take place about the end of September. The sum of 1800*l.* is allotted for the expenses of planting, and we observe that notice is given in our advertising columns that tenders for trees and shrubs are required. We understand that the landscape gardening matters connected with the cemetery have been intrusted to Mr. W. Davidson, of 36, Great Russell Street, Bedford Square.

European Vegetation in Van Diemen's Land.—Many common English weeds are naturalised about Georgetown, and some are perfect pests. Horehound is everywhere by the roadside, and Chamomile covers the fields and paddocks; in many places to the exclusion of Grasses. Thistles are fast going ahead all through Van Diemen's Land, and no one seems to trouble himself with them, although I have seen, I suppose, some hundreds of acres given over to them, and growing so thick in some places that I have walked over my shoes in the bed of Thistle-down which had blown from the withered stems. Sweetbriar, originally introduced as a hedge plant, is completely naturalised, and in places forms impenetrable thickets. It annually produces millions of hips, and if let alone will soon become as great a pest as the Thistles. The common Furze is also spreading, but not so rapidly in the western country. The Hawthorn grows perfectly, and forms excellent hedges as at home, but keeps within bounds; though it, too, fruits abundantly. I have seen Oaks heavily laden with well-grown acorns; but there are no trees, as yet, of large size. Elms and Ash are occasionally cultivated, but are not common. I do not think I have seen any of the Pine tribe in cultivation, except a few recently introduced to the Botanic Garden at Hobart Town. The great staple in the garden way of the colony is in Apples, Pears, and Plums, and Cherries; all of which thrive remarkably well, and they have already raised some seedling Apples and Plums, which are well-deserving of cultivation. There is a large trade in Apples to Melbourne. The smaller fruits are made into jams or consumed at home; and often suffered to rot on the trees, from their abundance. Gooseberries, Currants, Raspberries, and Strawberries grow equally well. But Peaches and Nectarines are only fit for tarts, and often fall off before they are ripe. Grapes just ripen and no more, and are of small size. I have been here the hottest months of summer without experiencing greater heat than we often have in England. There is less rain, and a greater number of clear days; but on the whole I scarcely think the summers hotter than those of England. People here complain (as in all the Australian colonies) of the rapid changes of temperature; but with less reason for complaining than in any other country I know of. To me the climate seems as nearly perfect as a sublunary climate can well be. *Harvey in Hooker's Journal of Botany.*

Preserving Sea-water in a Healthy State in Salt Aquaria.—Another very interesting experiment that I have had progressing very successfully for some time past, is the preserving sea-water in a perfectly transparent and healthy state without the use of vegetation of any kind, or in some cases, even of a scavengering mollusk. The adoption of these experiments was in a great degree forced upon me from circumstances which have been already published. In the paper read before the Meeting of the British Association at Hull, I stated that in consequence of the ravenous propensities of the crabs and the varieties of rock-fish, I had been obliged to establish several small imitation rock-pools, so as to separate these various depredators from each other; and as some of these, the blennies, also attacked the common periwinkle and other mollusks which were employed as scavengers, the plant or vegetation consequently became of little use, and was therefore omitted altogether from the arrangement. It may be asked then, how can the sea-water under such circumstances be possibly kept in a healthy state? Why, thus: by exposing a very extended surface of it to the action of the air, and at the same time limiting its depth. The means that I have been adopting for upwards of 12 months consist in the employment of shallow circular stone-ware pans of about 18 inches internal diameter by 5 inches deep; these are filled for about 2 inches with water, the bottom is supplied with sand and shingle, and numerous fragments of rock-work are arranged at the sides, some close below the surface of the water, others rising in gentle slopes above, and others again grouped to form cavities of retreat, so as to accord with the habits of the crabs, blennies, &c., placed in them. The whole is covered with a sheet of common window glass, raised about one-fourth of an inch from the edges of the pan by means of strips of wood, so as to allow a free current of air over the surface of the water, and at the same time impede the evaporation and prevent the greater part of the dust and soot from settling on it. By this arrangement, a very extended surface of water is submitted to the oxidising influence of the air, and the fish and crabs by their continual movements cause sufficient motion in the fluid to expose a fresh surface frequently to its action, and thus keep up its aëration. But it must be borne in mind that the oxygenation of the water thus effected is a very delicate equilibrium, and the maintenance of a healthy aëration is liable to be disturbed by very slight interfering causes; nor do I conceive that this method would be applicable except to such marine denizens as are either of such low organisation as to require but little aëration of the water, or to such as the crab tribe, the blennies, cotties, gobies, and those creatures which delight in very shallow water, or which have the power of climbing out of their liquid element. The varieties I have myself kept in perfect health for the period mentioned, are crabs, blennies, gobies, cotties, and varieties of Actinia. Cancer Mœnas has under these circumstances cast its skin three times during the present year, having increased in its dimensions most extraordinarily each time. *Warington in Annals of Natural History.*

The Unity of Science.—Each several science is linked and bonded to every other. The sciences possess no distinct or well-defined frontiers. Each science interlaces with every other; nor can we by any possibility study effectively a single branch without calling in the aid of several others. Astronomy yields us ample illustration of this. * * * Who could suppose that the labours of the old Greek geometers, while speculating on the plane sections of a cone, would have proved the source of the restoration of astronomical science? Or who could imagine that Archimedes and Appolonius, poring over their tablets scored with straight and curved lines, should have laid the foundation of the mariner's security while wandering over the wild and trackless ocean wastes? * * * Of chemistry, zoology, botany, geology, and mineralogy, what can be said at all commensurate with their great importance, singly and collectively? They are at once intimately united with each other, and to other branches of science. Chemistry has made wondrous progress since the days of the alchemists. They had secrets among them, too; but these have long since been discovered. The details of chemistry are so various, its points of union with other branches of science so diversified, as, within any moderate compass, to defy enumeration. Its applications in illustration of the processes going on in the organs of plants and animals are, perhaps, among the most interesting and instructive. Our planet, indeed, is one vast laboratory, where the wildest dreams of alchemy are more than realised. There the diamond is crystalised by means beyond our ken. Gold, too, is prepared, it may be, transmuted—for by some this doctrine is not considered untenable—by nature's gnomes, in a vast chemical arena, where the distillation of fluids and gases, the reduction and fresh incorporation of metals, and smelting of ores, is continually going on. * * * Physiology bears to the acts and movements of plants, and more especially animals, a relation similar to that which subsists between astronomy, dynamics, hydraulics, pneumatics, and inert matter. Kant defines an organised product as "that in which all the parts are mutually means and ends." It is, perhaps, more; for each part is not only a means and an end, it is also requisite to our just conception of the whole. Each portion must not only subserve some use, but depend for the exercise of its functions on the whole. To keeping this principle in view we are indebted for many of our greatest discoveries. To it physiology mainly owes its developement. * * * Thus, wherever we go, whether on the broad earth, or the heaving expanses of ocean; whether we pierce the briny depths, or soar amid the careering orbs in the starry vault above, there, everywhere, do we find the sciences sister goddesses, not one science, but all science; not physical science only, but that moral science, highest, most indispensable of all, walking in firm union, making a one out of many, constituting a unity of surpassing splendour—the Unity of Science! *Extracted from a Paper by Mr. William M'Cormac, read before the Literary and Scientific Society of Belfast.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—In cases where the gaiety of this house depends largely upon specimens brought from the stove, it will probably be necessary, should the present wet cloudy weather continue, to use a little fire heat, to prevent the flowers of tender things being injured by damp; but use this only if it cannot be safely done without, and in conjunction with a free circulation of air, for a high close temperature would be likely to injure hard-wooded greenhouse plants; and in the case of the stove plants, it is not cold that is to be dreaded, but damp. Look well to the Luculias, which are certainly our finest autumn-flowering plants, and keep them clear of their great enemy, black thrips; also see that they are well supplied with water at the root, giving weak manure water occasionally to encourage strong growth; but manure water should not be given to young

plants in vigorous health, as it might cause them to grow too freely, and late in the season for their blooming finely; also see that specimens of Camellias planted in the border are not allowed to get too dry at the root, after they have set their buds, as this is the great cause of the buds drooping; but in the case of young vigorous plants, it will probably be requisite to keep them very sparingly supplied with water for some time after their buds are set, in order to prevent their making a second growth; but this must be done cautiously, so as to avoid the opposite extreme, and plants that are at all likely to make a second growth should be freely exposed to light and air as soon as their wood is made. Look well to the stock of plants for autumn flowering, and afford these every necessary attention. Do not allow Chrysanthemums to suffer for the want of water, and those that have well filled their pots with roots should be liberally supplied with strong liquid manure to promote vigorous growth, and preserve the foliage in good condition. Keep the shoots thin by tying out, &c., and look sharply after mildew, applying sulphur the moment it is perceived. Seeds of the herbaceous Calceolarias ought to be sown at once if not already done; but we have now so many showy and handsome shrubby varieties, and these are so easily managed plants, and useful for decorative purposes, that the former, beautiful as they are, are hardly worth the trouble they cost. The shrubby varieties should be closely cut back after flowering, placing them in a shady situation out of doors until they break, and then be repotted, clearing away as much of the old soil as can be done without greatly injuring the roots. After repotting they may be placed in a cold frame, merely to guard them from heavy rains until the roots get hold of the fresh soil; but if strong bushy plants are desired they must be kept cool and airy at all times. Get the wood of Pelargoniums well ripened by removing the plants to a sunny situation out of doors as soon as they have done flowering, and keeping them rather dry at the root; for unless the wood is well matured before cutting back, there will be some danger that the plants will not break satisfactorily. Put in cuttings of Fuchsias, which if grown in a gentle heat through the winter, will make fine flowering specimens for next season. Stove.—The twiners here should be kept within due limits after this season, in order to prevent their shading the house too much; for although a thin shade during bright sunshine will be of great service to most of the inmates of this house, a constant shade will be most injurious to the great majority. Achimenes, Gloxinias, &c., which have done flowering for the season, should be placed in a light part of a rather cool house, or a cold frame kept close, and moderately supplied with water for some time, and not dried off at once, as is frequently done to the great injury of the tubers. Attend to tying out the shoots of young specimens of hard-wooded things, so as to keep them thin, and admit light, in order to secure short-jointed strong growth.

FORCING DEPARTMENT.

Pineries.—The plants intended to furnish the winter and spring supply of fruit must be treated with considerable care and judgment, in order to insure their showing at the proper time, or rather to do all that can be done to insure this, for the most experienced growers cannot always succeed in getting plants to fruit at the desired time. Attend to previous directions on this point, and continue to select the most promising plants, keeping them dry at the root, and fully exposed to light so as to check their growth, and induce a comparative state of rest for a few weeks. And those that have well-matured their growth, if wanted to fruit at once, should be kept close and warm, affording them a brisk bottom heat, and properly moistening the soil about the roots. Those intended to supply ripe fruit late in spring, if not considered sufficiently strong, may be encouraged to grow freely for some time yet, as if these can be got to show in November, they will be sufficiently early. Attend carefully to plants swelling their fruit, giving plenty of manure water at the root, and keeping the atmosphere warm and moist. In the present state of the weather a considerable amount of fire-heat will be indispensable where the fruit is ripening. Attend carefully to the watering of recently potted stock, as if too much is given the fresh soil is apt to become sodden, and if too little the old ball becomes so dry that it is not easy to get it properly moist again, and in either case the check the roots sustain frequently throws the plants into fruit prematurely. Get all succession stock requiring more pot room shifted as soon as circumstances will allow, in order that they may be well established in their pots before winter. Vineries.—The long-continued wet sun-cloudy weather is by no means favourable for Grapes that are ripe and expected to hang in good condition for a long time, and where the borders are of a strong adhesive nature, it will be advisable to cover with something to throw off the unusual falls of rain which we are experiencing; but where the soil of the border is of a light nature, and such that the water will drain through it freely, this will be unnecessary. Use gentle fires where the fruit is colouring, with a moderate circulation of air, and on fine days too much air can hardly be given at this stage. In the present state of the weather fire heat will also be necessary where the fruit is swelling. The wood will probably be well ripened in the early house, and the foliage turning brown, and in this case it will be desirable here also to prevent the border getting saturated with wet. If this house requires painting or any other repairs, this should be attended to as soon as the state of the weather will permit, while the house can be thrown open, and such work done more conveniently and much better than at any other season. Peaches.—The wood will probably be ripe in the early house by this time, but it will be advisable to keep the top sashes up at night until we have more settled weather, so as to prevent the borders getting saturated by rain. Give all the air possible, however, by the front ventilators, and keep the house cool and airy during the day. Give trees from which the fruit has just been gathered a good washing with the engine to clear the foliage of dust, &c. Melons.—Plants in dung frames will require considerable attention in the present state of the weather. Keep the bottom-heat as regular as possible, and endeavour to secure sufficient warmth from the linings to allow of giving a little air to prevent damp. Water very cautiously, and only when a fresh supply is absolutely necessary, and then give enough to moisten the whole mass of soil.

FLOWER GARDEN AND SHRUBBERIES.

The propagation of next season's bedding stock should be commenced at once, and gone about with the utmost possible expedition until every cutting is got in so as to ensure having strong and well established plants before winter, and this without the being under the necessity of keeping them so close and warm as to induce weakly growth. The wintering of bedding stock is generally a somewhat difficult matter, but the difficulty is often greatly increased through the cuttings being put in too late in the autumn to allow of having strong stocky plants before winter. It is doubtless true that the convenience for wintering bedding stock is insufficient in many cases, but however good the convenience may be the cuttings should be rooted early in the autumn, for many of our favourite bedding plants are troublesome subjects to carry over the winter with the best accommodation, unless properly prepared, whereas plants that are well established by the end of September and can be freely exposed to the open air on every favourable opportunity after that time, are by no means difficult to carry over the winter. Cuttings of such things as Anagallises and Nierembergias should be afforded a gentle bottom heat, and if this can be commanded without too much top heat, it will encourage the emission of roots in less time, without drawing or weakening the cuttings. Hollyhocks are unfortunately somewhat tedious to propagate, and do not afford cuttings very freely, consequently they are not over plentiful about most places. The choice sorts should be looked over frequently, putting in cuttings as they can be obtained, as autumn-rooted cuttings make prime strong plants for flowering the following summer, whereas those rooted in winter and spring often bloom but poorly the first season. Plants from which cuttings are wanted should be liberally supplied with manure water, mulching them with rotten dung in the event of dry weather, which will assist in promoting a vigorous habit of growth and inducing the formation of young shoots. See that these and Dahlias are secure against a sudden storm of wind. Go over the masses of Verbenas, &c., frequently, for the purpose of regulating the height, &c., and preserving the appearance of order and neatness over the whole garden. Get Stocks for spring flowering sown at once; also transplant Brompton and Queen Stocks to where they are to bloom, or, if this cannot be done, plant in nursery beds, allowing them plenty of space, in order to induce a stocky habit.

HARDY FRUIT AND KITCHEN GARDEN.

It is now too late for this season to prescribe a remedy for the Gooseberry caterpillar, but while the subject is exciting attention it may be worth while to state that syringing the affected trees with a decoction of Foxglove leaves will be found a certain cure. The Gooseberry and Currant trees here have escaped the pest this season, until some three weeks since, and then the caterpillars made their appearance so suddenly and in such force, that every leaf would have been devoured before all the hands at command could have saved them by picking off the insects. A quantity of Foxglove leaves were procured and steeped in a boiler of boiling water, and the decoction drawn off and sprinkled over the affected trees with a fine-rose syringe, taking care to wet the under sides of the leaves. The following day the insects generally seemed weak and inactive, and on the third day after dressing the trees very few were to be found alive, and any that may have escaped did no further perceptible damage. Therefore, where Foxglove leaves can be obtained, these afford a ready means of getting rid of this troublesome pest. Most fruit trees are growing very freely, owing to the moist state of the soil, and Peaches, &c., must be looked over occasionally. Winter Onions should be sown at once, also Cauliflowers for the early crop next season, a small bed of pickling Cabbage, Brown Cos, and some hardier sorts of Lettuce to stand the winter. The tops of the main crop of Onions had better be laid down if they are inclined to be too rank, going over the bed with a wooden-headed rake, and pressing the tops down sufficiently to check further growth. Plant out a good breadth of Endive on well-enriched soil of a light dry nature; also see to providing a good supply of Lettuce, &c., for autumn use. Attend to Celery, keeping it well supplied with water in dry weather, giving it as much manure water as can be spared for it, and keep the early crop rather closely earthed up. Vacant ground, or that which can be cleared of early crops, may still be planted with winter stuff, first giving it a good dressing of manure and a good deep digging. Stir the surface of the soil among growing crops. Cut Box edgings, and keep every corner clean and neat.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending Aug. 9, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the 12th, 1842—therm. 92 deg.; and the lowest on the 13th, 1839—therm. 32 deg.

Notices to Correspondents.

Bees: *Tassaggart.* We are not acquainted with the process of stupifying bees with flax dipped in nitre. Who is Dr. de Burvoys? If you will refer us to his work, we will endeavour to ascertain.

Collomia grandiflora: *C.* It is not uncommon for this to be apetalous. It is a plant which seeds very freely, and we have sometimes seen the whole crop of one year apetalous, while in the next perhaps every calyx contains a pale buff corolla. Your plant was so crushed from the mode of packing, that it was impossible to ascertain from the specimen what was its condition. *M. J. B.*

Fruit Trees: *Diss.* For a wall, 160 feet long, you may plant the following:—Peaches: Royal George, Noblesse, Bellegarde, and Barrington. Nectarines: Elruge, Violette Hâtive, and Balgowan; and the Royal and Moorpark Apricots. At equal distances each tree will have about 17 feet 9 inches of the whole length of wall. Then, as you intend to extend the wall in a few years, your best plan will be to plant intermediately for training to remove a Bellegarde, Royal Charlotte, Grosse Mignonne, and Acton Scott Peach; an Impératrice, Downton, and Balgowan Nectarine; and a Moorpark and Turkey Apricot. We are not aware of anything new more appropriate.—‡ If you will furnish us with your locality we will then give you the information you seek. Fruit trees that will suit one part of the country often will not succeed in another.‡

Greenhouses: *C W B.* There is no sort of objection to carrying your Vine up to a first floor before it enters your greenhouse; and if you can obtain a Vine with ripe wood long enough to pass inside the ground flour, let it do so. But if your Vine is to make its growth when it is planted before it enters, then you must carry it up outside. What you must take care of is that the border, or borders, no matter which, where your Vines grow, are so placed as to be warmed by the sun, and at the same time are not exposed to excessive dryness in summer. The materials you propose to use for your border are suitable.

Insects: *W B C L.* The beetles which have attacked the young shoots of your Pinus insignis are the common Hylurgus piniperda, a very troublesome species, whose history is given in the *Gardeners' Chronicle*, 1846, p. 740. It is for food that the beetles attack the young shoots, which should be picked off and burnt as soon as they show the slightest symptoms of being infested. The eggs are deposited under the bark, and hence all decayed and cut trees should be moved as quickly as possible and the bark burnt.—*Althæa.* The Hollyhock stems exhibit a large wound in the neighbourhood of the crown, which we have found infested to a small extent with a small chesnut-coloured Acarus, like a little black beetle; but which we consider to have been attracted to the wound after it was made. We can form no idea from the specimens sent as to the original cause of the mischief.—*J W—s.* The insects you have sent are the wood-boring Sirex gigas, the history and representation of which is given in the *Gardeners' Chronicle* for 1850, p. 517. *W.*

Microscope: *P. S.* A pocket lens with an inch focus will answer your purpose.

Mildew: *S A.* You may dust your Vines efficiently with a dredger; but if you dislike that, then get an Epps's or Ripley's sulphurator. The Vines should be damped first to cause the sulphur to stick to them.‡

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*H D.* Apocynum androsæmifolium, a native of the United States.—*Erzeroum.* 473, Anthyllis Tourneforti; 116, Astragalus chionophyllus; 88, Geranium lineatum; 36, Geranium tuberosum.—*W F.* Polygonum compactum from New Zealand.

Orange Trees: *W W.* You do not say what insect you mean by "*The* insect." If it is the scale you must trust to frequent scrubbing with water at 160°—180°.

Ponds: *J E C.* Your small pond will never be clear of green slime until a stream of water is made to run constantly through it. ‡

Potatoes: *J R R.* You had better leave your Potatoes alone for the present. If the evil increases, the haulm might then be pulled up with advantage. ‡

Strawberries: *H Doubleday.* The seedling Strawberry which you had from Mr. Myatt may or may not be a good late one, but its freshness and flavour were lost from close packing and carriage, which similarly affects all varieties of this class of fruit. ‖

Variegated Laurel: *J B.* A Laurel! why it is the common variegated Euonymus japonicus.

Vines: *W G A.* The small transparent globules on the stems and leaves of your Vines are exudations of sap, and not insect deposit.

Misc.: *L M.* You can only send a *stamped* newspaper to Australia, and then a postage stamp must also be affixed to it.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures, Linseed Cakes, &c.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprulites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.
THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.
The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO-PHOSPHATE for Turnips, Potatoes, and all other bulbous root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.
The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.
MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5s. per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1¼ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4l. per acre and under, and he can give reference to his employers in that and in other instances.
Watford, Herts, Aug. 11.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.
C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

NEW INVENTION IN LAWN MOWERS, WHICH POSSESS SUPERIOR ADVANTAGES TO ANY MACHINES NOW IN USE.—In the first place, they will cut the Grass either wet or dry: secondly, by the simple adjustment of a thumb-screw, they can be made to cut Grass either long or short; and, thirdly, these machines are drawn instead of being pushed and drawn, and consequently do not require half the usual power to work them. They are made to cut any width suitable for either man or horse. They will turn in very little room and cut at the same time. They are a perfect roller for the width they cut when thrown out of gear. The improvement can be attached to old machines, consequently old machines that are now laid aside, can be brought into use at a small expense.—N.B. These Machines can be adjusted and wrought by any unskilled labourer.
Price to cut 16 inches, £6 | Do. 20 inches, £7 | Do. 24 inches, £8.
Testimonial from JOSHUA MAJOR, Esq., *Landscape Gardener, Knostherpe.*
To MR GREEN Leeds.
"SIR,—As I always appreciate public and useful improvements, I most gladly give my testimony to your highly improved Mowing Machine. The one sent for my inspection and trial (cutting a breadth of 24 inches) was drawn on flat ground with ease by one person, and although at the time of trial the lawn was wet, it was cut with the greatest nicety. So complete and simple is the invention, that amateur gentlemen and even ladies may work either the 16 or 20 inch size with ease and pleasure, providing the Grass is not too long. For extensive places I should say the largest size (24 inches) would be most suitable, for even in undulating ground two persons may work it, but in flower gardens, when beds, &c., are crowded, either of the smaller sizes would be best. I congratulate you on your very valuable and useful invention, which, in my opinion, entirely surpasses and must eventually supersede all others, for it is not only free from intricacy and easy to the workman, but extremely expeditious in its operations, and consequently must prove a great saving in the management of Grass Lawns, and a great boon to the public. I am, Sir, your most obedient servant,
"Knostherpe, near Leeds, July 19. JOSHUA MAJOR."
Several Machines of the old kind, in stock, will be sold at half price, viz.:—16 in., 3l.; 20 in., 3l. 5s.; 24 ins., 3l. 15s.
THOMAS GREEN, SOLE MANUFACTURER.
Iron and Wire Works, North Street and Briggate, Leeds.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50s.
1½-inch Flexible Rubber and Canvas Suction for ditto, 3s. 6d. per foot.
1½ Gutta Percha Suction, 1s. 6d. per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.
Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.
1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.
1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.
May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.
PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£ s. d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1 12 0
2½ „	long 3 „ 3 „	gutta percha,	1 15 0
3 „	ditto 3 „ 6 „	or cast iron	2 12 0
3½ „	ditto 3 „ 6 „	flanged pipe,	2 18 0
4 „	ditto 3 „ 6 „	as required.	3 5 0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2 12 0
2½ in.	long ditto	ditto ditto	2 15 0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of coppers and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses; they may be fixed, when desired, under the stage.
May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.
Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Milbank Street, Westminster.

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.
Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

PAXTON WORKS, SHEFFIELD.
SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

THE HARVEST.
DRUMMOND'S IMPROVED REAPING SCYTHES continue to give every satisfaction, and the demand is yearly on the increase. They are as usual got up with every possible care, and are fitted with the very best picked blades. Price for three Scythes complete, 30s; do. for six, 56s. Carriage paid to the principal Railway Stations throughout the kingdom. W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.
*** To prevent disappointment early orders are respectfully requested.
N.B. Unknown correspondents will please accompany their orders with a remittance.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.
Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

The Agricultural Gazette.
SATURDAY, AUGUST 11, 1855.

AMONG the CAUSES OF FERTILITY which "Observation" recognises is the skilful adaptation of the crop to the land that is being cultivated. There is an essay in an early volume of the Journal of the English Agricultural Society on the natural indications of fertility in soils; there, of course, the adaptation both to soil and climate is complete; but where the selection of a crop depends entirely on the will of the cultivator, all other plants being kept down by force, the actual produce of the land may be no indication whatever of its fertility. To give that full exhibition and development, it needs that plants suited to its character and climate be selected. Mangold Wurzel would not show the fertility of soil in Scotland so well as Swedish Turnips, because the climate is against it. It will not show the fertility of a sandy soil so well as common Turnips, because it prefers a clayey loam. The adoption of a rotation of crops is important, not only as the means of perpetuating or increasing fertility, but also as the means of exhibiting and putting to the full measure of its power the actually existing fertility of the land; and conversely the introduction of a new plan to agriculture has been often useful, not only as furnishing a new and valuable form in which fertility may find vent, but also in the improvement which the very act of cultivating it confers upon the land. The introduction of Italian Rye-grass has been useful, probably, merely as an instrument of extraordinary power for the conversion of fertility into food. The introduction of Mangold Wurzel, on the other hand, has undoubtedly been of benefit by all the advantages of drill husbandry and fallow cultivation conferred by it on a stiffer class of soils than had been generally thought adapted to the growth of Turnips. The rotation of crops prevalent in any district is not only an indication of the fertility of that district, but of the intelligence of its cultivators; and exceptions to the general rule are often proofs of a superiority in the latter particular rather than in the former. Fertility finds expression, of course, simply through the crops grown upon the soil; and the due ordering of them so that in a given time the most valuable produce may result from a given expense is the problem which the farmer has to solve. The growth of Mangold Wurzel, or of Cabbage in place of Turnips; of Italian Rye-grass, or Trifolium incarnatum, in place of Rape or Rye, or Vetches; of Wheat, in the place of Oats; of Pota-

toes, in place of Beans or Peas, or perhaps in place of Swedes or Mangold Wurzel; of one rotation in place of another, or of any rotation with its greater annual produce in place of the constant growth of the Grasses, as in pasture land;—these are not, except in the long run, proofs of increased fertility of the soil. Whatever determination be arrived at as to the crops that shall be grown or retained, the result is, in the outset at any rate, only a more or less perfect expression of the actually existing fertility of the land. How important both that the most valuable expressions be given to this fertility; and that such a mode of expressing it be adopted as shall not tend to its diminution or exhaustion, is, of course, obvious enough. It is sufficient for the scope of these remarks to have alluded to this fact. The power of the different rotations of crops, whether as the exponents of fertility, or as in themselves fertilising agents, have been already abundantly discussed in volumes of the English Agricultural Society's Journal, to which we refer our readers. See especially vol. x. p. 345, where this subject is discussed in full detail.

It appears then that the lessons taught by observation in reference to fertility and barrenness in soils amount to this:—(1). That supposing climate to be favourable, or, if unfavourable, modified by shelter and by drainage, fertility is attainable on peaty soils by drainage, paring, and burning, claying and liming, and the use of portable manures; and after a year or two of cultivation, then by growing food for stock, as Grasses, &c., and waiting for consolidation by the lapse of time before breaking it up again for regular cultivation. (2). On sandy soils by marling, and the use of Rape-cake, guano, and bone-dust, as the means of growing food for sheep, whose consumption of this food with oilcake on the land shall still further fertilise, consolidate, and fit the land for growing Wheat and other grain crops: and (3), on clay lands by burning, liming, draining, and the use of dressings of bulky manures. It appears (4) that on *all* soils fertility is promoted by the use of water as a fertilising agent, whether this is obtained by means of irrigation or of drainage; that (5) on all soils, lime, when judiciously applied, is a fertilising agent; (6) that manure being simply food for plants, everywhere contributes to fertility; that (7) deepening the soil, and the thorough cultivation of it as a method of enlarging the home supply of food for plants are fertilising in their influence; and that (8) the adoption of a suitable rotation of crops is necessary both to give due expression to what fertility exists, and also to ensure its permanence and even increase.

As a last remark in reference to what observation teaches on this subject we may refer in general terms to the relations of landlord and tenant, and to the education and general intelligence of the population, as matters obviously and directly connected with it. The energy of individuals, shown in the opening of access to markets, and in the excitement of a neighbourhood out of the sluggish indifference and contentment with existing circumstances which so easily become habitual—instanced, let us say, in the successes of Lord George Hill around Gweedore, on the west coast of Ireland, almost as perfectly as in the history of the Ban de la Roche, under the pastorate of Oberlin—may be a subject of too general a character to claim detailed examination in an agricultural journal; but that the absence of markets, or of access to them, and that the listlessness and ignorance of the labouring class, are among the most obvious causes of barrenness of soil, observation will in many districts of Ireland and Great Britain testify.

DAIRY PRODUCTION.

The discussions at the Royal Agricultural Society's meetings between Messrs. Horsfall, Scott, and others, on the subject of dairy management and production (of which you have given copious details in your columns for some weeks past) will have at least this benefit—that they will cause agriculturists to pay some attention to the details of the operations carried on in their dairies.

In the case of far the greatest number of farms—viz., on those where only a few cows are kept, and these rather for the use of the family and servants than for the amount of profit to be derived—these operations have generally been left entirely to the skill and judgment of female members of the family. There were two reasons for the little attention paid to this branch of farming economics:—First, the "gentleman" farmer was apt to consider such dairy returns as a sort of pin-money, of which none would "go into the rent." Second, the lady considered dairy management as a craft mystery into which the other sex had little business to inquire; indeed, to inquire into which was an implied censure on the domestic management. But now, when the yield of milk from cows, the cream to be raised, the butter to be produced therefrom, form the subject of elaborate discussions before the Royal Agricultural Society, of lengthened papers of statement, counter-statement, and corrections in the leading agricultural journals, it is no longer *infra dig.* on the part of the male sex to inquire into details and "whisper suggestions" (we would not counsel more decided interference), nor an abandonment of time-honoured rights for the ladies to give such an explanation of their dairy experiences as can appear intelligibly in print.

Without entering into details for the past, I may state as the result I generally arrived at during several years' experience of a dairy of five or six cows (this number being as many as the ordinary domestics could attend to without an interference with other occupations, as the female members of the family could superintend without much labour), which was this—that each cow, besides bringing up its calf, gave a money return of 9*l.* to 12*l.* per annum: butter selling at 1*s.* per lb.; and milk at 1*d.* per quart for skimmed, and 2*d.* for sweet milk. This return could, of course, be obtained only by a tolerably liberal and careful system of feeding. Mine has generally consisted, during the summer and autumn quarters, of the run of a small Grass enclosure for a few hours each day, with cut mixed Clover and Rye-grass in the stall; during the winter and spring quarters, of Turnips and straw, with the addition of two daily cooked messes of chaff, Turnips, and meal.

Observing the discussions that were going on, I wished to know how the experiences of other dairies tallied with the results arrived at in my own, and for this purpose caused a careful record to be kept for one week, the details of which are given below. Of the six cows in my byre I had but three in milk, two not having yet calved, while a third was employed in nursing two calves; she has finished this with one pair born in March, and has entered on the charge of a second pair born in July. Of the three milking cows one (No. 1 in the following note) has been for some years in my possession; the other two were purchased in May a few weeks after calving, and in a very low condition. Thus, taking the three together, they were in less than average condition for milking; their breeding is a cross of the short-horn and Ayrshire; and their food was, as I have mentioned, cut Grass, with a daily run in an enclosure, where they have free access to water.

Their milking was as follows for seven days from June 26 to July 2. It will be observed that for two days each cow's milk was separately measured; for the other five days the collective quantity only was noted:

		Morning.	Noon.	Evening.	Total quarts.
		quarts.	quarts.	quarts.	quarts.
June 26	cow No. 1 ...	3½	3	3	... 9½ } 23
	" 2 ...	2½	1½	1	... 5 }
	" 3 ...	3	2½	3	... 8½ }
" 27,	the three ...	5	7½	7	... 19½
" 28,	ditto ...	8	7	8	... 23
" 29,	ditto ...	8	8	8	... 24
" 30,	ditto ...	8	8	8	... 24
July 1,	ditto ...	9	6½	7	... 22½
July 2	cow No. 1 ...	4½	3	3	... 10½ } 25
	" 2 ...	2	2	1½	... 5½ }
	" 3 ...	4	2½	2½	... 9 }
					Quarts, 161

which threw up 15 quarts of cream, and these churned on July 3 gave 16 lbs. 1 oz. butter and 9½ quarts buttermilk. Of the skimmed milk 64 quarts were sold or used; 82 quarts made 20 lbs. of curd.

The total returns for a week therefore were—

16 lbs. 1 oz. butter, at 1*s.*	£0	16	1
9½ quarts buttermilk, at 1*d.*	0	0	9
64 quarts skimmed milk, at 1*d.*	0	5	4
20 lbs. curd, sold at 2½*d.*	0	4	2
	£1	6	4

Supposing the milk had been sold fresh, the return at 2*d.* per quart would have been (161 × 2*d.*), 1*l.* 6*s.* 10*d.*; so that the manufacture into butter, &c., was, within a fraction, as profitable as would have been the sale (had that been practicable in the locality), of the sweet milk. This, then, gives a weekly return during summer of 9*s.* per cow. Suppose

20 weeks at that rate	£9	0	0
20 weeks at the lower rate of 6*s.*	6	0	0
12 weeks to run dry	.....		
	£15	0	0

We obtain 15*l.* per annum as the money return to be expected from a fair average cow fed liberally but not pampered. How does this tally with general experience? Possibly correspondents from different districts will kindly reply to this query. *S., Inverness-shire, July* 19.

THE SHOW OF HORSES AT CARLISLE.

We could not but be struck with the apparent slight put upon a breed most deservedly esteemed for agricultural purposes. The round barrel, compact form, and great activity of the Suffolk fit him peculiarly for farm work, and no horse is more staunch to the collar. At a late meeting of the Royal Agricultural Society the Suffolks took the majority of the prizes; but at Carlisle, though there were some capital specimens of great strength shown by Mr. Barthropp and Mr. Wilson, they received but one commendation. And perhaps this fact is the more observable since in what are esteemed the heavier and larger breeds, the very qualities of compactness and activity, for which the Suffolk is so remarkable, are those which most commend themselves to the judges. These two gentlemen are, however, bent upon bringing the breed to the highest possible perfection, and in certain instances, especially Mr. Barthropp's filly that obtained a commendation, competing as she did in one of the strongest classes, they have succeeded to admiration.

With respect to the Clydesdales we were not quite so well pleased as we expected to have been. We observed too many light bodies and long legs, several round nondescript gummy legs, and a very obvious irregularity as to size. The quick-stepping qualities of the breed we could not judge of, save from observing the disposition of the shoulders, which was good generally. We saw no specimen of the hardy, compact little Derbyshire horse, a breed much entitled to the notice of farmers. It may answer to breed large horses for London brewers, &c., but middle-sized, neat, active, enduring animals are required for farm-work; a kind that eats half as much as your great dray horse and looks better upon that half. Where the farmer has to contend with mud roads, great weight, combined with strength, is requisite.

We have to thank the local committee of Carlisle, and the worthy mayor of that town, Richard Ferguson, Esq., for having brought together such an assortment of thorough bred and coaching stallions, of hunting mares, fillies, and geldings, as we have never before had the pleasure to see. The breeding of horses for the chase, carriage horses and hacks is undeniably the business of farmers, and we hope that the Royal Agricultural Society will not allow any meeting to occur without having provided for the representation of the particular classes we refer to. She may migrate to towns where mayors not be so wealthy or so spirited as those of Lincoln and Carlisle. It is well, we think, to allow private liberality so to display itself, but failing this practical co-operation of local committees and official personages, we do hope the Society may take the matter into her own hands.

We do not think in England that we have to struggle against a defective taste—the love of, and the perception of a good horse seems inherent in the multitude. But nevertheless we do consider that the Royal Agricultural Society may do excellent service by giving to the public good models. We do not want the negative to guide us to excellence, but the positive. And as in art, no man attains to a true appreciation of beauty by the study of defect, neither as a breeder can a man reach to the perfection of the type but by an intimate study of its harmonious proportions. And there are types beyond which the breeder cannot go, for the same rule would seem to apply in the breeding of horses as in the breeding of horned cattle. It is now proved that considerable prizes will bring out valuable animals of this sort, and all we hope to see is, that the Society making use of the power she possesses, the farmers will show the appreciation of her efforts by strengthening her hands.

The six classes to which these breeds are confined contain 59 entries. At Lincoln there were but two classes and 17 entries.

The thorough bred stallions were well represented. "Ravenhill" and "A British Yeoman" compete very closely. The former is an Irish bred horse; he takes the prize offered by the mayor. For our part we prefer "The British Yeoman," who is certainly a fine horse, and receives more lustre from his stock exhibited in the yard than "Ravenhill" does from his, which are more abundant. The coaching stallions might have been better, we thought. Mr. Shaw showed three, for one of which he received the prize. This horse struck us as being a most perfect model of the class, not so heavy as of yore, but more in keeping with our increasing want of speed. It is extremely difficult to judge of these animals; we see them only in a state of quiescence. Many a horse has fatal imperfections that only reveal themselves when he is in motion. It is quite necessary that we hold our own opinions in abeyance to the decision of the judges, and the public should view them in the light of "confidential friends." Some of the mares with foals at foot are exquisitely beautiful animals, possessing lines of symmetry that every breeder should imprint indelibly upon his memory. Take Sir Wilfred Lawson's "Madam," the winner of the prize, for instance; take Miss Bell's "Vaultress" (and her splendid foal by "Ravenhill"), or take Mr. Pybus's "Miss Hudson," as examples.

May this good beginning have a good ending, the result being increased attention to the breeding of a class of horses for which England has ever been so deservedly famous. *H. R.*

GARDENS FOR COUNTRY SCHOOLS.

I refer to the uses of a garden or a plot of ground cultivated by the agricultural class in our schools—its uses not only as furnishing lessons in the practice, and illustrating doctrines in the theory of agriculture, and conferring bodily skill in the use of farm tools, but also as increasing the emoluments of the teacher or the funds of the school.

The assertion which I make—that the theory and practice of cultivation can be efficiently illustrated in a garden—is proved by a number of well-known facts.

Professor Daubeny's illustrations, in his lecture before the Royal Agricultural Society of England, of the power of successive crops of the same plant to exhaust the land off which they were continually reaped, were taken from garden plots. Tull's argument on the ability of the cultivator by careful pulverization of the soil and its exposure to the air, to balance in a great measure to his soil the want of manure, was originally built upon his observation of single plants and single garden rows, though no doubt it was afterwards corroborated by experiments in field culture. And the experiments of the Rev. S. Smith, of Lois Weedon, of the same kind, though extended over a small field, might well be prosecuted in a large garden, so as perfectly to illustrate his views. The most complete series of experiments on the relative value of the different Grasses

was conducted by Mr. Sinclair, gardener to the late Duke of Bedford, at Woburn, in the garden. And one of the most exact comparative inquiries into the relative merits of different varieties of Wheat is reported in the first volume of the English Agricultural Society's Journal as having been conducted in a garden in Gloucestershire. Many an instructive and satisfactory experiment, illustrative of the relative value of manures, will be found recorded in our agricultural journals as having been performed in garden plots. I would especially refer to a most valuable and instructive annual report of his experience of this kind, which has been published in the *Gardeners' Chronicle and Agricultural Gazette* for many past years by the Hon. and Rev. L. Vernon Harcourt. Modes of cultivation, methods of manuring, rotations of cropping, and the merits of the various crops—all these particulars, which among them pretty nearly complete the circle of the mere cultivator's experience—all of them are capable of perfect illustration in the garden. And how perfectly the rationale of any particular observation can thus be obviously presented to the eye and mind any one can perceive. You may talk to a boy for any length of time on the advantage of stirring the soil and of deep cultivation, inasmuch as it admits the air more perfectly throughout the substance of the soil, and thereby facilitates those chemical processes by which the soil and its contents are fitted as the food of plants; but no quantity of merely verbal instruction will equal in its force, either upon the understanding or the memory, the lesson on that subject which that same boy would receive if, after having dug a hole in the hardened ground, he were told to put into it again the earth he had just taken out of it. The heap remaining over, which he could not replace, would represent more distinctly to him the bulk of additional air thus introduced into the soil by its disturbance than any argument unsupported by this simple experiment could do. Well, I need not say anything more on this point. I hurry on to the usefulness of the garden, both as furnishing agricultural practice to the boys (I mean in the art of using the spade and hoe and other agricultural tools), and as adding to the emoluments of the schoolmaster. On these again I must be satisfied with a reference to the experience of others—in terms, too, so short as to be little more than an enumeration of the sources where information regarding it may be obtained. The Highland schools, under the committee of the General Assembly of the Church of Scotland, in which agricultural instruction has been introduced, have several acres of land attached to them; 4 to 6 acres is the usual extent; and a common report is in these terms in which the Elgin school is described:—"There are some acres of land attached which are farmed by the boys to the number of 25; two hours a day, on an average, are allotted to work. They dig, trench, weed, manure, sow, &c., under the management of a superintendent, and are trained to the use of the spade and other agricultural implements with considerable address." In Ireland, again, under the superintendence and inspection of Dr. Kirkpatrick, of Glasnevin, there are many agricultural schools in operation:—27 model schools in operation, 5 about to begin, 45 ordinary agricultural schools in operation, and 50 workhouse agricultural schools; and from the experience of any of them there might be drawn facts enough to bear out Dr. Kirkpatrick's testimony that it is perfectly practicable and highly important to connect this agricultural with ordinary literary instruction in our country districts.

Then, again, in England I can quote several instances:—First the schools on the plan of the late Mrs. Davies Gilbert, of Eastbourne, in Sussex, of which a full report will be found in a pamphlet by Mr. Cuthbert Johnson, published by Ridgway, "On Increasing the Demand for Agricultural Labour." These schools were said to be self-supporting—the children paying only 1*d.* a week, and receiving instruction during the morning of the day, and working during the afternoon; the land, 4 or 5 acres to each, was rented at a farmer's rent by the master of the school, who cultivated it by the aid of the boys.

My second instance, and a most instructive one, is recorded in a pamphlet by Thomas Batson, of Colley House, near Exeter, entitled "How to improve the Condition of the Agricultural Labourer,"—a self-supporting system by which boys may be trained in acts of industry, and at the same time receive a suitable education.* This publication describes an experience of five years in the employment of boys on a farm, who for their labour received their maintenance and education, they and their parents finding this maintenance and education, both ordinary and agricultural, to be an ample return for their services, and Mr. Batson finding, as he proves in great detail, their services to be quite worth the expense he was at in lodging, clothing, feeding, and instructing them. Mr. Batson's pamphlet deserves to be widely known and read.

My third instance is one of a class of similar cases—a reformatory, industrial, agricultural school, established and carried on at Hardwicke, near Gloucester, now for several years by the wise and painstaking benevolence of Mr. Bengough and Mr. Baker, two magistrates of the county of Gloucester.

Fifteen boys work more than 10 acres of stiff clay land, and their work goes a considerable way towards their support. The report and rules of the Children's Friend Reformatory School, Hardwicke, Gloucestershire, dated January of last year, states the successful result hitherto of this experiment. I believe that any one who will read the report of the General Assembly's Committee on their Highland schools, the reports of Dr. Kirkpatrick on the Irish Agricultural Schools, the report by Mr. Cuthbert Johnson of Mrs. Davies Gilbert's Schools, by Mr. Batson of his experience on the subject at Kynaston, in Herefordshire, and the report of the Hardwicke Reformatory School, may confidently accept the conclusion I propose for his adoption, that in a large garden boys may receive efficient practice in the use of tools, and in the conducting of agricultural processes; and that from a large garden so managed a skilful schoolmaster will derive sufficient return to make it a very considerable source of income to himself or to the school. The great fact as proved especially in the Irish schools is that all these advantages are obtainable without interfering with the main purpose of the school—the communication of sound instruction in the elements of an ordinary education; and I contend that in agricultural districts even these might usefully have an agricultural turn given to them—that reading books, for instance, might furnish lessons on agricultural subjects, and that lessons in arithmetic might have special reference, even from the beginning, to agricultural calculations, landing the pupil ultimately in questions of account and expense relating to all manner of farm methods and results, such as digging, and trenching, and hoeing, ploughing, grubbing, harrowing, rolling, drilling, horse-hoeing, manure-making and the application of it; sowing, whether by hand or by machine; mowing, reaping, and harvesting, measurement of land, manure, ricks, and building; estimation of produce, and all sorts of measure work connected with draining, embanking, fencing, planting, and building and road-making. I have lately had submitted to me a considerable quantity of MSS. by Mr. Ewart, of Newcastle, professing to be on agricultural arithmetic, which will probably be published by Messrs. Blackie, of Glasgow, and which appears very excellently adapted to the purpose of that kind of instruction to which I refer. *J. C. Morton.*

* Groombridge and Sons.

REPORTS OF THE CROPS.

Ayr.—Wheat.—Early and winter sown rather thin. Late good. An average crop on the whole. Oats.—On early thin soils light; on deep damp soils good but late. Barley and Bere.—Heavy crops, but little comparatively sown in this district. Beans.—Good. Turnips and Mangold.—Early: and in general very promising. Potatoes.—The healthiest, and will apparently be the most abundant crop since 1845. Harvest may commence partially on early soils in a fortnight, but not generally before the 1st September. Crops much in the same state of forwardness as at this time last year. *Alex. Ralston.*

Bucks: *Claydon.*—Wheat is a full average crop on the ground, but it is late, and of a dark unhealthy colour. Barley is very good where it has been sown in season: late sown is not good. Oats generally very good. Beans (spring) full crop. Beans (winter) very bad; did not stand the winter. Turnips generally very bad and late. Potatoes are very promising, but partially diseased. Hay less than half a crop; Grass is now plentiful. Harvest will not be general before the 22d, and not then unless we have bright clear weather. On the whole, with good harvest weather, the prospects are good. *Alex. Fraser.*

Cheshire.—Wheat about a week ago had the appearance of being more than an average. The crops generally were full on the ground, stiff in the straw, and filling well in the ear, without any defects from rust or blight of any kind: by the very heavy rain which fell on the 25th ult. all the full crops were laid flat, and it is to be feared great mischief has been done, as I have invariably noticed that if Wheat is laid only a week or ten days before being ripe, it does not prove so heavy in the ear as when it stands; of course much will depend upon the weather for the next fortnight or three weeks, both as to quantity and quality; but judging from present appearances, I cannot estimate the injury at less than from 15 to 20 per cent. Barley is a very full crop, but is beaten down, even more than the Wheat, and must, I fear, under any circumstances, prove an uneven sample. Oats have generally stood the best, and have the appearance of an average crop. Potatoes are very luxuriant, and little disease has yet shown itself; but the trying time has not arrived. There has been a serious loss in the hay crops; very little has been secured, and the floods have carried away and spoiled nearly all in the low meadow lands, which are the chief support of the dairy stocks during the winter. *William Palin.*

Devonshire: *Dartmoor.*—Breezy weather of late, with more or less rain daily. Grass here almost overpowering. Wheat in this county, should heat speedily come, will very partially be cut in about two weeks, but the general harvest will this year be during September, weather permitting. The crops of Wheat, as also Barley, vary considerably, about an average probably each may reach. Oats promise well, so do Potatoes. Two and three sowings of Swedes will only give very irregular crops—common Turnips the fly has spared, and these may be abundant if the weeds can be kept down. Mangolds magnificent. Hay much damaged—crops heavier than expected. Clover Grass fell very light. *Geo. Wm. Fowler.*

Devonshire: *Exeter.*—The appearance of the Wheat is full 10 per cent. worse than it was ten days ago, being much beaten down by wind and rain, and having a great deal of blight: and if this wet weather continues the consequences will be serious: on the contrary, should fine weather and plenty of sunshine take place we shall, I think, have an average crop. Barley and Oats are much laid: I think the latter will be an abundant crop. Peas and Beans are not much grown about here, but the former is, I think, an average crop. Swedish Turnips have failed, but common ones are likely to be good. The Potato disease has appeared with more than usual virulence. *George Turner.*

Devonshire: *Tavistock.*—"The rain it raineth every day." Much hay remains in the fields, and much that has been carried has been got in very indifferent order. A good deal not yet cut; the same wet that has hindered the hay harvest has impeded the growth of Turnips, which look stunted and patchy: many suffered from flea, which thay have never recovered. There are some appearances of disease among Potatoes. Hereabouts Wheat and Barley might have been an average crop; the former is now being damaged by rust, especially where it is heaviest: and Barley seems to change in colour (with a poor prospect of a good sample) very unevenly. Oats are a moderate crop—all very late. The last week of this month harvest may begin. The pastures were never known so bare; the backward spring has never been recovered, and stock have consequently not got fat; the frost destroyed all the old Grass upon the pastures, and both sheep and cattle were almost starved till after Midsummer, and there has been no help this year from Clover or Vetches, for both these suffered equally with the old Grasses. *John Benson.*

East Lothian.—Wheat is tall in the straw, the ears are large, and at least of average thickness on the ground. Some fields have been partially damaged by the Wheat fly, while others have wholly escaped. The crop is late, and there will be little Wheat harvest until near the close of the month: as yet there is nothing to prevent it being a full average, though the yield and quality may be inferior to last year. Barley is a remarkably heavy crop, almost every field being laid. Much of it may be ready for the sickle in less than three weeks. Oats are also changing colour, and are almost as bulky as is desirable. Beans are tall in the straw, and are still growing; they appear to be well podded. Altogether the appearance of the grain crops is highly satisfactory; at the same time a change from the present moist weather to a clear and dry atmosphere is earnestly to be desired. In regard to Turnips and Potatoes they are both most luxuriant. Numerous fields of Swedes, and the greater part of the Potatoes, are already so close that it is impossible to tell which way the drills run. Hay is still generally in the tramp-rick in the fields: it is but a light crop, and its quality has been considerably damaged by the late rains, the rain guage showing the fall to be 4 inches for the last month, which is almost unprecedented in this quarter. *G. H.*

Hants: *Lymington.*—The crop of Wheat is not at all a good one in this neighbourhood: thin on the ground, and latterly very much injured by the red rust. Barley good. Oats good, Beans and Peas inferior. Potatoes very much attacked with the disease these last few days. The weather has been very bad for the growing crops these last 10 or 14 days, cloudy sea fogs, rain, and mist. Turnips pretty good: hay very short; Grass also short. *James Lomax.*

Huntingdonshire: *Brampton.*—All our crops promise great abundance. The Wheats are good on the ground, with a fine ear, and at present are free from disease. The Barley is a magnificent crop on every description of soil. Oats, also, are good on our high lands. Potatoes are the finest crop I have seen for years, and at present show no symptoms of disease. Turnips are indifferent from having been so frequently re-sown, but are yet within the range of a good crop. The only exception to this good prospect are the Wheats on our fen soils. The severe spring killed the plants, and in many instances the crop will not reach the third of an average. Harvest will be general in three weeks from this date. *Peter Purves.*

Kent.—On some of the heavy land Wheat districts, as Whitstable, Herne, &c., the Wheats are a full average crop, and Wheat cutting commenced on the 6th inst. on most other soils. The Wheats are much blighted and laid by the heavy rains, and I never saw a greater defect in the ear in East Kent: we shall be under two-thirds of last year's crop. Barley is over an average crop. Peas—not half an average crop. Beans—a very partial crop, but a good average. Oats—a good average. Hay—not half a crop. Clovers—not half a crop. Swedes—very good where the land has been well managed, but there are failures, and the black caterpillar has been very destructive. Potatoes, previous to the 1st inst., never looked more promising: the last three days the disease has made its appearance, and so rapid is its progress that in 24 hours every stem in the gardens is diseased. East Kent will not grow two-thirds of last year's crop of corn. You may make whatever you please of this, and insert my name with it. I think that you will find a bad account of the Wheat crop. *Robert Matson.*

Lanarkshire: *Hamilton.*—The crops in this county are generally good, with the exception of Wheat, which is uniformly thin on the ground, and large breadths resown with Oats or Barley. This is the result of the severe and protracted frosts of winter and spring, and want of snow to protect the plants. Oats are a full and bulky crop, and on good soils, much lodged with the recent heavy rains. Barley, Beans, and Peas also promise a full average. As yet no definite time can be fixed for harvest. All will depend on the weather, and as it is now become very wet and unsettled, there is no reasonable prospect of cutting for three or four weeks. Green crops are abundant, and as yet no accounts of disease in the Potato have come under our knowledge or observation. *David Gardner.*

Lincolnshire: *Worlaby House.*—I consider Wheat in this neighbourhood rather under an average crop; very late, the colour bad, and some quantity mildewed. Barley an average crop; very much laid with the rains. Oats under an average. Beans and Peas none grown. *Wm. Hesseltine.*

Mid-Lothian: *Bath ...*—The Wheat crop is full, partly laid down with recent rains, and late. The Barley much down, but earlier. Oats, the lightest of the cereals, about an average. Beans bulky. Potatoes never so promising, and no disease. Turnips promising. Hay light, and injured with rains. Pastures abundant. Harvest the last week of August. *James Melvin.*

Notts, Newark.—Wheat is thin on the ground, and where there is a heavy crop (a rare thing) it is very much beaten down by the continual heavy rains we have had during the whole of last month; it begins to look very dark in the straw, as if inclined to mildew. I think it will be under average, and not likely to be ready to cut in general till September, except the weather alters. Barley is a heavy crop, and much laid and thrown about, but forwarder than Wheat. Beans poor; Oats a fair crop, and some nearly ready: hay and seeds very light, and but little hay got: Swedes and Turnips promise well, but it is hard to keep the weeds down, it has been so wet. This has been a fine drying day, but the glass is falling. Potatoes very fine; no sign of disease at present. Mangold, Carrots, and Cabbage very good. Little or no Wheat to thresh in this neighbourhood. *John Young.*

Norfolk: *Bacton Abbey.*—Our harvest will generally commence here about the 24th of the month. The Wheats are not promising quite so well as a fortnight since, many fields showing mildew more or less: the ears are large, but not well filled; the crop on the whole may reach, but not exceed, an average. Barley and Oats are good, and I should say more than an average. Peas and Beans are also pretty good. The hay was the lightest crop ever known here, and a part of it badly got in. Turnips and Mangold Wurzel very promising, indeed I never saw them better. *W. Cubitt.*

Northampton.—In answer to your queries respecting the growing crops of corn, I must report the crop of Wheat as not an average one. It is very backward, and if dry weather does not soon set in the consequence will be great. Maggot to some extent has also shown itself. Barley is a great crop, but very much beat down by storms. Oats and spring Beans about an average. Hay crop very light and not well got. Turnips very bad, Mangold Wurzel good, Potatoes good. *Wm. Gray.*

North Fife: *Drumond.*—Wheat—tall, thin on the ground, touched a good deal with fly: a fortnight later than usual, but with good weather may reach an average crop. Barley—a full average crop, and much earlier than usual. Oats—short and thick on the ground; may reach an average yield of grain, but will fall below it in straw. Beans and Peas—bulky and well podded. Hay—a lightish crop, with small appearance of a second cutting. Potatoes—very equal and luxuriant, and no symptoms of disease. Turnips—very fresh and vigorous. Mangold—good, where a "braird" was obtained; bad where the braid was tardy. *John Haxton.*

Northumberland: *Herham.*—We are sorry to say the hopes expressed in our last report as to a favourable hay harvest have not been realised. From the 2d to the 12th proximo we had very fine clear weather, and a good deal was done among the hay, but since the latter date we have had rain every day, with three exceptions, and a great quantity of hay has been very much destroyed. The barometer has ranged from 28.90 up to 29.57; mean of month, 29.39. The heavy thunder rains of Saturday the 28th have laid the crops very much, and the continued wet prevents our reporting so favourably of the crops as we did a month ago. Fine sunny and drying weather may still do much for the crops, but should this wet "muggy" weather

continue, both quantity and quality will be far below an average. We cannot now expect any general harvest till September. Turnips are looking well on Turnip soils, but even there the continued dashing rains are telling against them, especially the later sown fields. Potatoes are still keeping clear of disease, and looking very well. Grass is abundant, but stock are not doing so well as they would with less wet, even at the expense of less meat. Not only are they never dry, but they never get a dry mouthful. Grazing stock of all kinds are very high-priced. Stagshaw Bank Lamb Fair was held yesterday, and notwithstanding a very full show of lambs high prices were asked and given, though slowly. The show consists chiefly of half-bred (Leicester and Cheviot) lambs, and prices for these ranged from 24*s*. downwards.

Warwick: *Stratford on-Avon.*—Wheat.—A considerable quantity of Wheat in this district lost plant; a great portion resown, yet there is much thin, which the late rains have improved—where the crop is heavy it is badly laid—with fine weather it might be an average, yet in individual cases it must be under. Barley.—The early sown Barley is a heavy crop, and badly laid on good conditioned lands, and to some extent damaging, requiring fine weather immediately; later sown much improved by the rain; crop above an average. Beans. The dry weather continued too long for this crop; under an average. Peas.—Peas are a large crop, depending upon the weather; if fine, above an average. Turnips.—Swedes sown very early on strong soils are good plants; were sown later almost a failure. On light soils a considerable portion of good plant, with some failures. Hay.—A very light crop on most lands, and a quantity injured by the rains. Potatoes look well at present. Mangold Wurzel a fine crop. *W. Gibbs.*

Wilts: *Avebury.*—With reference to the crops in my neighbourhood they vary much, some being a free crop, others very far from a plant on the ground since the rain. The thin crops are much improved; the free crops are gone down, in consequence will receive great injury—that is, in reference to Wheat. Barley is very heavy, and also much injured from the rain. Oats a good average. Beans good. Peas in some instances blighted; still, on the whole, a fair crop. Turnips and Swedes in a very bad state for want of fine weather to clean them. Forward hay-making was good, a light crop with the exception of Sainfoin, which was good. We shall not commence reaping before the latter end of the month. Potatoes look well; if rains continue I fear they will feel the effects. *Geo. Brown.*

Worcestershire: *Vale of Evesham.*—The Wheat, Barley, and Oat crops in the Vale of Evesham are exceedingly good. The Wheat will be ready for the sickle about Monday, Aug. 20. The Barley and Oat crops are ripening fast, and will be fit for cutting the earlier part of next week, or about the 14th. The early Peas, which are an excellent crop, are cut, and many carried. The late Peas, which are equally good, will be ripe in a few days. Autumn planted Beans are an indifferent crop, spring planted are very good. The hay crop, of which much is damaged, will not average more than from 15 cwt. to 25 cwt. per acre. The Potatoes were gay and blooming until Friday last; but now the tops in some gardens and fields are spotted similarly to that of the last few years; the tubers, however, are sound and plentiful. The Swedish Turnips are very indifferent, having been destroyed again and again by the fly. The aftermaths of Grass and Clover are excellent. *Henry Hudson.*

Yorkshire: *Richmond.*—Wheat—an average crop, much laid, and being laid early the sample is certain to be inferior. Oats—an average crop. Barley—a full average crop. Beans—not many grown in the district, well laden though rather short in the straw. Turnips have had to struggle through many difficulties, but promise well now. Potatoes look exceedingly well, as yet I have heard of but one instance of the disease, but I fear this dull damp weather will develope more. Harvest will be late. *H. J. Turner.*

Yorkshire: *Thirsk.*—The Wheat crop up to the time of the rains falling was generally light and thin, but has since then much improved in growth of straw, but I am much afraid is far from being improved as to the growth of the grain. It is a good deal broken down and lodged, looks dark and brown in the chaff, and appears not to fill well in the ear. The present appearance of the Wheat crop is very doubtful. I have not as yet seen much decided mildew, only small patches; but the very dark colour seems very hazardous. Should the rains cease soon I scarcely think it an average crop, but should they not it may be much under. Present appearances are that scarcely any Wheat will be cut in August. Barley a heavy crop, but very much thrown down by wet. Oats a light crop. Beans look well; mine are well podded, but was told yesterday by three respectable farmers a few miles from here that their Beans had scarcely any pods on the stems. Turnips are much overdone by wet and very foul with weeds, which cannot be overcome till dry weather. Potatoes are good, and so far free from disease. Meadow Hay and Clovers light crop, much abroad, and very seriously damaged, particularly Clover; scarcely any secured in stack. Pasture land and sheep seeds growing rapidly. *Peter Stevenson.*

CROPS IN IRELAND.

The appearance of the crops in Ireland is most gratifying: the Potatoes are luxuriant, and hitherto there has not perhaps been half a dozen well authenticated instances of disease; there is, however, a report, not that I know resting on any good authority, that without any sign of disease in the leaf or stem the tuber has been found seriously affected. A very large quantity is planted this year, and as the disease ever makes its first and partial appearances, which it has not yet done, at the least a month before it becomes generally destructive, we may reckon on the crop approaching pretty near maturity before the pest shall sweep over the whole land; it happened in 1847 (I think) that the crop was so far matured before it was struck by disease that the consequent withering was supposed by the sanguine to be the natural effects of its age, and they fondly hoped that the disease had disappeared, forgetting that it was unobserved in 1845 till after the Potatoes were dug, when they rotted away rapidly in the house and the pit. And this year, from foregone experience, ought to be one of late attack; every alternate year has been so from the first notice of it. We may therefore reckon on an abundance of this valuable esculent. And as the Oat crop promises largely, Ireland may be expected to contribute a good share to the general food fund. Turnips also promise well, though the early sowings suffered much from the fly. The meadows, which are always late with us, have so benefitted by the early summer rain that I think they will be on the heavy side. *J. M. G.*

Home Correspondence.

Subsoiling.—To drain lands with the more impervious subsoils previous to breaking up these subsoils seems to be so settled a question that to consider it may hardly be permitted, yet is it not so settled relatively to the mode of breaking them up?—to subsoil ploughing—and does it not apply as strongly to deep ploughing and trench ploughing as to subsoil ploughing, and if it does not, why should it not? It seems generally put forth with something of empirical dogmatism that "in all sort of retentive lands subsoil ploughing does positive harm and no good, without the pre-construction of a system of deep subsoil drains," also that subsoiling should not take place till two years after this draining has been effected. But as I do not recollect that I have ever met with the whys and the wherefores, perhaps some of the better instructed correspondents of the *Agricultural Gazette* may have the kindness and condescension to enlighten me. To me it appears that the mere breaking up of the subsoil by the action of the subsoil plough, independent of draining—no doubt a desirable previous operation—must facilitate the fertilising of it, as well as the drying of the surface by the giving deeper channels for the escape of surplus water, in fact, placing the impervious sheet somewhat deeper. Why should it not in some degree pulverise it; why not increase its porosity; why not accelerate its decomposition, and enlarge its capacity for the circulation of air and moisture; why not in some degree effect all the beneficial ends which are effected by subsoiling when the nature of the ground or its artificial acquirement is such as to ensure them? Why should this operation do positive harm and no good? It is quite fair to take an extreme case; suppose a field with only 2 inches of fertile earth, of active soil on its surface on an impervious subsoil; can it be doubted that this field will be better conditioned when some 6 inches of this impervious subsoil has been rendered pervious? Shall we not have a similar result under the same management, however deep may be the surface or active soil? Will not the rain-water equally, in both cases, penetrate the broken earth and run along the top of the unbroken soil, as it did before, only at a greater depth, until it finds its natural outlet? There was a time, a palmy time, for subsoiling, when, consequent on the recommendation of Mr. Shaw Lefevre, subsoiling without draining prevailed to some extent in Britain, Sweden, Prussia, European Turkey, America, the West Indies. The practice was naturally opposed by Mr. Smith and the drainers, for it may be well supposed that, impressed with the value of subsoil draining, they were not prepared to admit of any efficacy in subsoil stirring without it. *J. M. Goodiff.*

Turnips Starting.—If I mistake not some discussion took place a short while ago in these pages on the premature starting of plants; I have but a clouded recollection of such having been the case, and cannot refer to the when or where, but possibly the case I am about to mention may throw some additional light on the subject. Some of Sutton's Six Weeks' Turnips got from them in 1851 were sown this spring at the same time, under the same manure and preparation, and in the same square with fresh Early Dutch seed; while the latter have all bulbed well, the former with the exception of about one in 20 or 25 have all started, having previously shown a most luxuriant growth far exceeding that of the Dutch. I have sown the same seed in the intermediate years, the last year, however, late, with scarcely any instance of a start. *J. M. G.* [Sutton's six weeks is intended for late sowing.]

Deep Draining.—We hear and read a good deal from time to time about the relative merits of deep and shallow draining in strong clay land; but it has not often happened to me to see a genuine clay farm drain satisfactorily on any principle. I myself have undertaken a farm of the above character, and think I have succeeded in bringing the soil into a perfect state as regards drainage, having carried out the principle of deep drainage to its fullest extent in a manner which to me has produced most satisfactory results; and in corroboration of my own opinion I am prepared to show at the present moment 100 acres of Wheat against any other 100 acres of Wheat in either Surrey or Sussex standing on an arable farm of equal extent with mine, 170 acres, for 20 guineas; or if that is not considered sufficient to induce parties to take so much trouble, I will say 50 guineas. The crops to be inspected by an independent person to be mutually agreed upon. *James Corry Sherrard, Kinnerley Manor, Reigate.*

Salt for the Gooseberry Caterpillar.—Observing in your last that soot has been used against this destroyer alone, and mixed with lime and with ashes, I was surprised not to find it also used with salt, which has been found one of the best mixtures with soot; but salt alone, or with lime, or with gas liquor, or soda ash alone, which will not smut the fruit, are all effective soil vermin killers. Gooseberry bushes, with their depth of root, would probably bear 10 cwt. of salt per acre, spread over the ground of the fly, and watered with diluted gas liquor (1 to 5 or 6 water) enough to carry it gradually down 2 inches. This done now and again, when the first flies begin to appear, would probably so pickle the cocoon as to kill the fly, if not the larva, the leafy fertilising quality of the ammoniacal liquor counteracting the hindering reaction of the salt on vegetation, while both co-operating in the destruction of vermin, might supersede the necessity of digging away and burning the soil. *J. Prideaux.*

Cow in Milk.—My master keeps one cow, of which I, who am the gardener, have the care. The one we now have is a half-bred Alderney, that gave, when in full milk, about 12 quarts per day of excellent quality. In the spring of 1850 she nearly died in calving, and the cow doctor, who got her through it, said she would not live through another calving, and advised us to milk her as long as she was worth her keep, and then sell her for killing. For the first year or two there was no particular diminution in the quantity of her milk; since that time it has decreased very gradually, and at this moment, after being milked over five years, she gives upwards of 4 quarts per day. As she was in very good health we determined to run the risk of her calving rather than part with so valuable an animal, and within the last 12 months have made several attempts to get her in calf; but they have been all fruitless, so that at length we have given it up, and determined on parting with her. We have now just got another. The object of my sending this statement is to inquire with a view to the treatment of our new cow, whether there is any objection to proceed with her as we have done with the other? We do not expect the same success, but we wish to ascertain from the opinion of better judges than ourselves whether it is injurious to an animal, or objectionable on any other account, to keep her from the bull as long as she continues to produce her full quantity of milk from her last calving? *J. G.*

Societies.

ANNUAL MEETING OF THE AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

Carlow, *August 8th, 9th, 10th.*—It is satisfactory to believe that whatever differences have arisen, and whatever evils have been permitted to creep into the administration of this Society, are on the eve of being adjusted and corrected, if they have not been actually so treated already; and it is owing to this we believe that, despite difficulties of weather, prejudice, &c., the present show, judging from early appearances, bids fair to be equal in importance to any, and superior to most, if not to all, of those which, under auspices apparently more favourable, preceded it. Carlow is being thronged by respectable people, many of whom have this day first seen this now very important inland Irish town.

The Judges of implements are proceeding with their task; and, considering the number and variety of specimens to be examined, the task on their industry, intelligence, and patience is onerous indeed. And, speaking of such implements, the applicability of many of them justly considered as highly important to England and Scotland is, to say the least of it, rather questionable, under the peculiar circumstances of Ireland at present. Still, complicated in their action and adjustment as to many in Carlow they must appear, and over costly as by many who know, or pretend to know, their use and application they will be considered, it is very well we should see them, at least in the hope that sooner or later, when more strongly pressed by high rates for manual labour very imperfectly performed, we may know there exist the means by which many of our difficulties can be overcome; know where such means can be acquired and the value of them when acquired. So far, in these respects, the Royal Agricultural Improvement Society of Ireland has done its duty; but much more still remains to be done before the Society can rest satisfied of having the undivided support of the Irish public generally. The Society have now not only a fine opportunity of showing their usefulness in this respect, but they have also in the present year apparently one of the most abundant harvests during the memory of the oldest amongst them, still one of the most uncertain as to maturity of produce that occurred in Ireland during the last 40 years at least; and we cannot now, with labour dear because the labourers are scarce and provisions high, and dearer still because what we have of it is both weak and unskilled, expect to bear up against the pressure of taxation if we cannot not only "make two blades of Grass grow where but one grew before;" but make 1*s*. expended in labour do as much work as two did before. Some of your readers may think I have dwelt too long on this latter subject when they expect a mere formal notice of the Show. We now proceed to give a description of such of the trials as have been conducted on the first days of the meeting.

The trial of implements took place in a field within half a mile of the town. For light and general ploughing there were tried six, and in the following order:—

No. 1. A Scotch plough, by Mr. Gray, of Belfast.
2. An Irish do., by Mr. Graham, Dublin.
3. An Irish do., by Messrs. Spindan, do.
4. An Irish do., by Mr. Miller, Dunbar.
5. An English wheel plough, by Messrs. Ransome.
6. An English do. do., by Messrs. Howard.

The work was done by all considerably but by some remarkably well. The general opinion amongst Irishmen was that No. 2 was superior, and No. 6 next. But it appears from the dynamometer that No. 6 proved first, No. 5 second, No. 4 third, and No. 2 fourth; and this to us farmers as well as implement makers is a lesson which we should profit by.

Much dissatisfaction at one time appeared to exist in the minds of some Englishmen, participated in by several of the Irish, on the arrangements for testing the ploughs, the objectors alleging that each plough should have a separate ridge or bed to act upon; but allowance should be made for the peculiar circumstances of the case. A sufficient number of strong steady horses could not be had to set all ploughs to work simultaneously, consequently one or two pairs of horses had to do all. Hereafter there may be less cause of such complaints. For the deep ploughing there started five ploughs, as follows:—

No. 1, Graham's, as above, by three horses, to which a fourth had to be added. No. 2, Gray's, as above. No. 3, Howard's, as above. No. 4, Ransome's, as above; and No. 5, a plough by a Mr. Smyth, through Mr. Eels, of Dublin. No. 1 did pretty fair work. No. 2 a comparative failure. Nos. 3 and 4 did their work in a most perfect manner; whilst No. 5 was an utter failure, and withdrawn. All at once agreed that the prize here

was between Nos. 3 and 4, and the dynamometer told in favour of No. 4. For the deep ploughing, the wheeled ploughs are admitted to be decidedly superior to the unwheeled; and it is to be hoped our Irish prejudices and prepossessions in these respects will be regulated more by common sense without regard to country; and if the Royal Agricultural Improvement Society of Ireland did nothing, or may still do nothing more for Carlow County than holding their show in its capital, these proofs alone of the utility of such shows and trials will cover a multitude of the sins laid, whether justly or otherwise, to the charge of some, if not of the whole, of their committees and council, or as some think to the inefficiency of some of their officers. My advice then would be to our plough and other implement makers to "take a wrinkle" from their English brethren in the manufacturing of ploughs for deep work, the more especially if they so wish it for the accommodation of parties entering on the cultivation of supposed worn out but still naturally rich deep Irish soils. The next trial was of Subsoilers, of which three were used. No. 1, Gray's, as above; 2, Ransome's Archimedian Plough; and 3, Bentall's Scarifier, stripped of its scarifying appendages by Mr. Stanley. They all did their work well as subsoilers, and so would a common Irish plough, the soil being sandy and deep, and consequently unfit for such a trial as subsoiling. Indeed, the same objection held good as to deep ploughing generally. This part of the judge's business over they repaired to the show yard, which is admirably arranged, and peculiarly well adapted for such purposes, to finish their inspection of implements. Whilst this was going on we had a look at the different kinds of stock as they entered the yard, of which more hereafter.

At the dinner of the Council on this day Mr. D. J. Wilson, Belvoir County, Clare, referred to the encouragement that should be held out to working farmers, to whom he is the steadfast friend, to join the Society. He referred to the conduct of the Society in sending the deputation to the Paris agricultural meeting, regarding which he composed a truly Irish poem, which he in part recited, amidst the cheers and laughter of the company, Captain Bell joining, though one of the objects of this poetic satire. A word or two now for the stock to be adjudged to-day, Wednesday morning.

Class A. *Short-horned.*—Section 1, bulls calved since 1850, 13; sec. 2, do. in 1853, 11; sec. 3, do. after January, 1854, 22; total, 46. Section 4, cows in calf of any, 22; sec. 5, heifers in calf calved in 1852, 9; sec. 6, do. do. in 1853, 17; sec. 7, do. calved after January 1, 1854, 17; total, cows and heifers, 65.

Class B. *Other Breeds.*—Section 1, Devon bull calved since Jan. 1850, 2; sec. 2, polled Angus, do., 2; sec. 3, Galloway, do., no entry; sec. 4, Ayrshire, do., 3; sec. 5, West Highland, do., no entry; sec. 6, Kerry, do., 3; total, 10. Sec. 7, Devon cow of any age, 1; sec. 8, heifer calved since Jan. 1852, 2; sec. 9, Devon heifer, 1854; sec. 10, polled Angus cow, any age, 1; sec. 11, do. heifer, 1852, 1; sec. 12, do. heifer, 1854; sec. 13, Galloway cow; sec. 14, do. heifer, 1852; sec. 15, do. heifer, 1854; sec. 16, Ayrshire cow, any age, 5; sec. 17, do. heifer, 1852, 5; sec. 18, do. heifer, 1854, 1; sec. 19, West Highland cow, any age; sec. 20, do. heifer, 1852; sec. 21, do. heifer, 1854; sec. 22, Kerry cow, any age, 2; sec. 23, do. heifer, 1852, 3; total, 21. Extra premiums, four sections, no entry. Townley challenge cup, one entry only.

Class C. *Horses.*—Section 1, stallions foaled since 1848 and before Jan. 1, 1853, 16; sec. 2, stallions foaled after 1853, 12; sec. 3, mares in foal or having reared one in 1855, 15; sec. 4, filly foaled in 1852, 5; sec. 5, do. foaled in 1853, 9; sec. 6, do. foaled in 1854, 6; total horses, mares, and fillies, 63.

Class D. *Sheep:* Leinsters.—Section 1, shearling rams, 38; sec. 2, two shear do., 31; sec. 3, any other age not exceeding 6 years old, 14; total, 83. Sec. 4, shearling ewes, 7; sec. 5, not exceeding 5 years old, 10; sec. 6, ewe lambs, 7; total, pens of 5, 24.

Class E. *Long-woolled Sheep*, not as Leinsters.—Section 1, shearling rams, 12; sec. 2, two shear do, 9; sec. 3, any other age not exceeding 6 years old, 4; total, 25. Section 4, shearling ewes, 4; sec. 5, not exceeding 5 years old, 9; sec. 6, ewe lambs, 3; total, pens of 5, 16.

Class F. *Cheviots*, or any other mountain kind.—Section 1, ram of any age not exceeding 5 years old, 4; sec. 2, shearling ewes, 2; sec. 3, not exceeding 5 years old, 4; total, pens of 5, 6.

Class G. *Southdowns.*—Section 1, shearling rams, 8; sec. 2, any other age not exceeding 5 years old, 10; total, 18. Section 3, shearling ewes, 4; sec. 4, not exceeding 5 years old, 7; total pens of 5, 11.

Class H. *Swine.*—Section 1, boar under 18 months old, 28; sec. 2, over 18, and under 36 do., 4; total boars, 32. Section 4, breeding sow under 18 months old, 18; sec. 5, do. over 18 months old, 17; total sows, 35. Section 4, breeding pigs not over 10 months old, 6 lots of 3.

Class K. *Poultry.*—Contained above 100 pens.

Class L. *Dairy Produce.*—Best firkin of butter for the English market, 38 lots; sec. 2, dairymaid six months in last employ, 2 prizes; sec. 3, best coopered six firkins of butter, one competitor; sec. 4, best firkin for the foreign market: sec. 5, dairymaid, 2 prizes; sec. 6, cheese, best coopered six firkins, one competitor; sec. 7, cheese, new milk, not less than 20 lbs., one competitor; dairymaid, 2 prizes.

Class M. *Flax.*—Section 1, best bundle mill-scutched, not less than 16 lbs., three competitors; sec. 2, ditto, hand-scutched, two competitors; sec. 3, flax seed saved by grower, three competitors; sec. 4, six hanks hand-spun yarn, one competitor.

Thus far the stock which, when analysed, will give the reader a better idea of our progress. This analysis I mean to give when I can have seen the stock properly, and have time to examine them. The same is all I can say for the implements; amongst the most novel here are the reaping machines about being tried, and when I witness the experiment will, if time permit, say a word or two on their applicability to our Irish grown corn. The trial over—but one appeared, that of Hussey, now Bray's patent; the first trial was made under peculiarly unfavourable circumstances, corn partly laid, and the horses badly adapted to such purposes. Still I saw enough to lead me to believe this machine will be extensively used in Ireland hereafter, and calculated to remedy some at least of the evils glanced at in the introductory part of this letter. The Irish public of all grades were much interested in witnessing the successful working of such machinery, as on my coming from the trial field I met some hundreds going there. There can be no doubt about its getting a prize, for although there is no competition the machine has decided merit. The implements exhibited in the show yard are in the following order:—

	Lots.
1. Messrs. Richmond & Chandler, Salford	37
2. Ransomes & Sims, Ipswich	31
3. Wm. Procter Stanley, Peterborough, Northamptonshire...	18
4. Alfred Croskill, Ironworks, Beverly, Yorkshire	15
5. Richard Coleman, Chelmsford, Sussex	5
6. Ganet & Son, Leiston Ironworks, Saxmundham, Suffolk	9
7. Hernulewicz, Mein, & Co., Glasgow	41
8. Smyth & Ashby, Stamford, Lincolnshire	11
9. Kennedy & Sons, Aston's Quay, Dublin	25
10. William Graham, Smithfield, Dublin	4
11. Richard Robinson, Belfast	5
12. Edmundson & Co., Dame Street, Dublin	14
13. Henry Shendon & Co., Bridgeport Street, Dublin ...	10
15. Thos. Eels & Co., Mary Street, Dublin	20
16. D. Millar, Dunleer, co. Louth...	5
17. Forshaw & Co., Liverpool	13
18. Jas. and Frederick Howard, Bedford	12
19. David Allen, Moneymore	10
20. Caldow and M'Kinnel, Dumfries	3
21. Pery & Mitchell, Dublin	4
22. Js. & J. Mitchell, Dublin	2
23. F. M. Spong, Carlow	52
— Ditto, Draining Tools	11
24. John Dickson, Gortnamond, Tullamore	6
25. John Wightman, Belfast	2
26. Meshail Kehal, Lisnevagh, Baltinglass	1
27. Thomas Rogers, Carlow	4
28. Thomas Halligan, Tullow, Co. Carlow	2
29. Rev. John Bonham, Ballitore	1
30. Thomas Murphy, do.	2
31. Samuel Johnson, Glasslough	1
32. Captain M'Clintock, Bunbury, Lisnevagh	1
33. William Walpole, Millgrove, Cahir	2
34. Edward Carroll, Crememore House, Clonegal	1
35. Messrs. Lyons, Windmill Street, London	1
36. William Dray & Co., Swan Lane, London	3
37. Messrs. Noble & Ryan, Dublin	1
38. James Nowlan, Belan, Castledermot	1
39. St. John Blacker, Ballydonohue, Tarbert	1
40. H. A. Betts, Wotton-under-Edge, Gloucestershire ...	1
41. James Nowlan, Belan, Castledermot, four kinds of Horse-shoes	1
42. John M'Grath, Anan Street, Dublin	3
43. Thomas E. Daly, Exchange Street, Dublin, a Collection	1
44. Samuel Houghton & Son, Carlow, Casks of Manure ...	10
47. John M'Arthur, Engineer and Valuator, Capel Street, Dublin, a Collection of Roots and Concentrated Manures	2
48. James Shekleton, Dundalk	5
49. Thomas Biggs, Great Dover Street, London	1
50. Joseph Long, Sheep-dipping Specifics and Specimens of Skins and Wools acted upon	14
Total Specimens	385

Wednesday evening.—I have had a short run through the Show-yard, and cursorily glanced over the different kinds of stock, produce, and implements shown. It has struck me that there are sad fallings off in some things, and great improvement in others on this occasion compared to former shows. Bulls, for instance, in all sections, and cows, aged particularly, appear to be deteriorating, whilst sheep are vastly improved. Pigs rather improved. Poultry falling off. Horses increasing in number, but not in quality. But in implements and machinery, a manifest improvement, both in numbers, finish, and applicability. *Carlow, Wednesday, August 8th.*

Yorkshire, Malton, *Aug. 2 and 3.*—The show, in all its departments, was excellent, the entries in horses and poultry exceeded anything previously known to the society. Among the implements that which attracted most attention in this department was the "Steam Horse," also shown at Carlisle. The Leeds and Yorkshire Flax Society offered two sets of prizes for green and scutched flax, to be exhibited at the show; and two sets of premiums for the best cultivated crops of flax grown within thirty miles of Leeds. The premiums for the green and scutched flax were, as will be seen below, awarded at the show; those for the crops will be decided hereafter. The premiums for the best five acres of flax brought five competitors; those for the next two acres induced four growers to enter as competitors. These crops will be viewed upon the land when the proper time has arrived for judging them. At the Council dinner a discussion took place on *The Causes Affecting the Productiveness of the Wheat Crop.* Mr. H. S. Thompson said—

The question, as they could not control the seasons, was, how are we to make our Wheat crops more productive? He believed that the great difference between a productive and an unproductive crop, was to be found in the great difference in the number of grains in the ear; for in all crops which might be called moderately good, there was nearly the same number of stems to the acre: and as an illustration of that opinion he had brought with him an ear of 1854 and one grown on the same kind of land in 1853. He admitted that the former was a picked head. On counting it the previous day he found that it contained 79 grains, whilst in the ears of the crop of 1853 the number ranged only from 20 to 30. The crops of 1854 yielded rather more than five quarters to the acre, whilst the crop of 1853, which looked quite as well, and had full as many stems, only yielded two quarters. The crop of 1853 was really a splendid looking crop, and everybody told him it would yield from five to six quarters an acre, but, in consequence of bad yield, there was only about two. Leaving out the thin starving crop, where they had to look about for a stem, he was satisfied that the great difference between a productive and unductive crop was in the yield of each head, and not in their number. If this was not the case how could they account for farmers being willing to give 2*l.* or 3*l.* more an acre for some descriptions of land? For instance, there was a good deal of land about the Lowlands and Dunbar which was let for from 4*l.* to 5*l.* an acre, which so far as they could see was not different from land in this country for which 30*s.* an acre was paid, and yet hey knew the Scotch farmers would not take farms to hurt themselves. The appearance of their homesteads and everything about them showed that they were making a profit. He had also some Oats with him, which had been grown under peculiar circumstances. In the first instance the crop had been thinned by wireworm, whilst in the latter there was a thick crop on the ground, but on taking the heads he found one of the former to contain nearly 600 grains, whilst the latter only contained from 30 to 40. He thought these facts proved the proposition he had advanced. If they accepted the proposition as proved, the next point would be to consider in what way they could make the heads productive. He would first take the case of light land, as it was land with which he had had more to do than any other. For the last 15 years he had farmed land, the history of which he could trace for 150 years. It was at that time bought for about 6*l.* 10*s.* an acre, and was let for 2*s.* 6*d.* an acre. During those years it had undergone a great many steps, and it was now let at 50*s.* an acre, and was as good arable land as any in the neighbourhood. Originally it was exceedingly light; but from time to time soil and clay had been put upon it, and after growing Turnips, and being put through other modes of culture from year to year, it had so improved that it now produced something like five quarters an acre. He looked upon the fact of the farmers in the Lowlands paying 5*l.* an acre for their land, and yet realising a profit, as a sort of model for their imitation, and he thought they should not rest satisfied until they had cultivated their land up to the point they believed it possible to attain. How were they to do this? They might take some 20 tons of farmyard manure, or a few cwts. of guano or lime, and put it upon the land, and the result would be that the crops would look well in the winter and spring; but when the heavy rains of summer came they would be laid as flat as their hands, and scarcely yield any corn at all. These manures were very good within certain limits, but they did not do used in excess. If they wanted to produce good crops, they must go to work cautiously. In truth, there was no royal road to farming. If they wished to get their land into a first-rate state of productiveness it must be by a number of steps extending over a number of years. He began with this land to which he had referred about 15 years ago, and it was then worth 40*s.* an acre. He began by putting clay upon it, and he had no hesitation in saying that every load of clay he had so put upon it had paid well; and he was satisfied that the putting of clay or marl on light land, at the rate of 100 loads per acre would be found to answer. He had had to lead his about a quarter of a mile, and it had cost him less than though he had given the land a good dose of lime. If they put clay upon the sand it would not wash down, but remain upon the surface, and even where it did go a little below, it might be brought up again by deep ploughing. It was a great improvement, without being costly, and was within the means of tenant farmers to try for themselves. The heavy clay lands of the country were generally considered to be the best Wheat lands, and he believed a great deal might be done to improve clay lands generally. He would not speak of drainage, because everybody admitted its necessity, who knew anything of agricultural pursuits, but there was the question "How are we to make the clay lands as productive as the light lands?" If they wished to make it productive, they must put upon it sand, and the object of that was to enable the roots of the plant to grow readily in the soil, so that they could get the full benefit of what there was to be got. They must begin by ploughing rather deeper, and then increase the depth from 1 to 2 inches every time they put it to fallow. If they could get the sand from their neighbourhood, it would be a great benefit; but if they could not, they must burn the land; he did not mean that they must burn the whole surface, for he should be very sorry to see them do so on any land. The best way was to put in a scarifier or grubber, and cut off all the weeds, take about 2 inches from the surface, and then collect them into small heaps as in Worcestershire, and set them on fire. If the land was dry they would burn with the stubble and the weeds, and if it was not dry they must put in a little coal, which would burn it thoroughly, and they would be surprised what a small amount of coal would do. Last year he had a field of about 9 acres which he burnt in this way, and though it came very wet before he had finished, 3 chaldron of coal (of small coal) enabled him to burn it completely. The whole cost of collecting, putting it into heaps, and of coals, did not amount to 6*s.* an acre, which was a cost thoroughly within the means of the tenant farmer. If they would set to work with their land, put clay and marl upon light land, and sand upon clay land or burn it, and at the same time expose it to the atmosphere, they might depend upon it they would succeed in bringing their land into a very much more productive state, without laying their money out at great risk, as was the case when they applied a great deal of hand tillage. He knew of no reason why they should not be able to bring any land into a much more productive state by continued cultivation in this manner, though they might not perhaps be able to bring it quite up to the Lothian level he had mentioned.

AWARD OF PREMIUMS.

[The Judges did not complete their labours until Thursday afternoon. The prizes awarded were the following:—

CATTLE.

Best bull of any age: 25*l.*, R. Booth, Northallerton; 10*l.*, Lord Feversham, Duncombe Park, Helmsley. 18 entries.

Best yearling bull: 20*l.*, F. H. Fawkes, Otley; 5*l.*, A. L. Maynard, Marton-le-Moor, Ripon. 14 entries.

Best bull calf, upwards of five months old: 10*l.*, C. Towneley; 3*l.*, F. H. Fawkes. 18 entries.

Best cow of any age: 15*l.*, R. Booth; 5*l.*, J. Booth. 17 entries.

Best 3-year-old cow: 10*l.*, J. Douglas, Athelstaneford, N.B.; 5*l.*, Lord Feversham. 3 entries.

Best 2-year-old heifer: 10*l.*, C. Towneley; 5*l.*, R. Booth; 8 entries.

Best yearling heifer: 10*l.*, J. Hall, Kiveton Park, Worksop 5*l.*, J. Douglas. 15 entries.

Best heifer calf: 7*l.*, C. Towneley; 3*l.*, R. Booth. 10 entries.

Best fat ox of any age: 5*l.*, H. Vynner, Newby Hall, Ripon. 8 entries.

Best fat ox of any age: 5*l.*, H. Ambler, Watkinson Hall, Halifax. 6 entries.

Best cow of any breed for dairy purposes: 7*l.*, Q. Clark, Bilton, York. 6 entries.

SHEEP.

Best shearling ram: 15*l.*, J. Borton, Barton-le-street, Malton; 5*l.* do. 32 entries.

Best ram of any age: 10*l.*, J. Borton; 5*l.*, J. Simpson, Spofforth Park, Wetherby. 18 entries.

Best pen of five ewes: 5*l.*, W. Taylor, Thorntherpe, Malton; 3*l.*, J. Holiday, Barmston, Lowthorp. 5 entries.

Best pen of five shearling wethers: 5*l.*, T. Dawson, Poundsworth, Driffield.

Best pen of five shearling gimmers: 10*l.*, W. Abraham, Barnetby-le-Wold, Uceby; 5*l.*, T. B. Browne, Hampen, Andoversford. 4 entries.

Best ram of any age: 5*l.*, Lord Walsingham.

Best pen of five shearling gimmers: 5*l.*, Lord Walsingham.

Best black-faced Scotch ram: 5*l.*, J. Estill, Blake House, Pickering; 2*l.*, T. Wilson, Bilsdale, Stokesby.

PIGS.

Best boar, large breed: 5*l.*, T. Horsfall, Otley; 2*l.*, W. Prince, West Ayton. 6 entries.

Best sow, large breed: 5*l.*, J. Harrison, jun., Heaton Norris; 2*l.*, T. Horsfall. 7 entries.

Best boar, small breed: 5*l.*, Lord Wenlock; 2*l.*, G. Mangles, Givendale, Ripon. 15 entries.

Best sow, small breed: 5*l.*, T. Horsfall; 2*l.*, Lady Meredith, G. Mangles.

Best three store pigs, of the same litter: 5*l.*, W. B. Wainman, Carrhead, Skipton; 2*l.*, M. Barroby, Dishforth, Thirsk.

Best sow of any breed: 5*l.*, W. B. Wainman, Carrhead, Skipton; 2*l.*, G. E. Taylor, Oatlands, Leeds.

Best boar of any breed: 5*l.*, G. Mangles; 2*l.*, G. E. Taylor.

HORSES.

Best stallion for hunters: 10*l.*, W. Daykins, Doncaster; 3*l.*, J. Smith, Martin Lodge, Bridlington.

Best stallion for coach horses: 10*l.*, J. Johnson, Brigham, Driffield; 3*l.*, D. Holliday, Newland, Hull.

Best stallion for roadsters: 10*l.*, J. Foxton, Waithwith, Richmond; 3*l.*, R. B. Ridsdale, Watergate, Ripley.

Best stallion for agricultural purposes: 10*l.*, J. Ramsbottom, Bilham Orange, Doncaster; 3*l.*, A. Hill, Normanby, Kirby-moorside.

Best mare and foal for hunting: 5*l.*, H. Marr, North Holme, Malton; 2*l.*, H. S. Thomson, Hirby Hall, York. 16 entries.

Best mare and foal for coaching: 5*l.*, P. Clark, Bilton, York; 2*l.*, G. Piercy, Garton, Driffield. 4 entries.

Best roadster mare and foal: 5*l.*, J. Staveley, Dotterill Park, Kilham; 2*l.*, T. Nicholson, Watton, Driffield. 10 entries.

Best mare and foal for agricultural purposes: 5*l.*, J. Simpson, Humnanby; 2*l.*, Earl Fitzwilliam, Wentworth House, Rotherham. 10 entries.

Best 3-year-old hunting gelding: 5*l.*, W. S. Gofton, Wharram-Percy, Malton.

Best 3-year-old hunting filly: 5*l.*, J. Kirk, Moor-Monkton, York.

Best 3-year-old coaching gelding: 5*l.*, B. Johnson, Frodingham Bridge, Driffield.

Best 3-year-old hackney for agricultural purposes: 5*l.*, F. Jordan, Eastburn, Driffield.

Best 3-year-old for agricultural purposes: 5*l.*, T. Chantrey, Acaster, Selby, York.

Best 3-year-old for agricultural purposes: 5*l.*, F. Jordan, Eastburn, Driffield.

Best 2-year-old coaching gelding: 5*l.*, T. Plummer, Thormanby, Easingwold.

Best 2-year-old coaching filly: 5*l.*, C. Pybus, Catterick.

Best 2-year-old agricultural gelding or filly: 5*l.*, R. Simpson, St. Trinians, Richmond.

Best yearling for agricultural purposes: 5*l.*, J. Foster, Southburn, Driffield.

Best pair of horses for agricultural purposes, worked during the season: 5*l.*, Earl of Carlisle, Castle Howard.

Best hackney, not less than four years nor exceeding six: 5*l.*, R. Jones, New Malton.

Best 4-year-old hunter: a silver cup of the value of 20*l.*, T. Ellerby, Whitwell, York; 5*l.*, R. Stockdale, Skerne.

Notices of Books.

Whittington's Treatise on the new Anglo-French Patent, with Process and Proceeds for and from Mangold Wurzel. Kelly and Co., 19, 20, and 21, Old Boswell Court, Temple Bar.

This is an advertisement of the estimated profits of the manufacture of spirits from Mangold Wurzel. These hinge upon the possibility of purchasing the roots at 10*s.* a ton, with liberty to take back the pulp after all fermentable matter has been extracted. We should not be disposed to sell Mangold Wurzel on those terms, and do not believe that they could be profitably grown at such a price unless possibly close to the distillery, where the pulp may be consumed almost without expense of carriage. We extract a passage in which the author refers to his experience of Mangold Wurzel consumed in early autumn:—

"It is well known that—excepting only swine, which thrive and fatten amazingly on Mangold only, given at any season—animals do not thrive, but waste, if fed largely on raw Mangold before Christmas; were it otherwise, this bulb would be much more extensively grown, &c.; as it is, the Duke of Bedford and others parboil or steam, and so use beneficially in quantity, and early, without waiting for fermentation, &c., by stacking and process of time, to remove the deleterious properties; effects whereof I have proved by feeding a cow-team largely and solely thereon excepting some hay; the cows lost flesh, some were paralysed, some died; so I sent the coatings of their stomachs, which flaked off quite black, to Mr. Gibbs, the Honorary Secretary of the Royal Agricultural Society, and to Mr. Sewell, of the Royal Veterinary College, who pronounced the results above referred to as having arisen from the before-recited causes. I have kept small bulb Mangolds till Midsummer, shipped them in the spring with live-stock to India and Australia, finding them then to be better and keep longer than Swedes. I have made some very fine and fat sheep in the spring, fed only on Mangold and hay. The process of maceration and extraction will enable Mangold to be used safely, cheaply, and beneficially at all seasons and for all feeding purpose, besides saving time, trouble, and cost to many growers and consumers."

Calendar of Operations.

AUGUST.

North Hants.—With fine weather the prospect of a good and abundant harvest in this district is favourable, although reaping will not be general until the middle of August is passed, and hence conclusions may be drawn too early as to the probable yield. On the clay soils the Wheat is heavy and thick on the ground. On the light chalk hills the plant is deficient on some farms, and when this occurs the crop will be much under an average. Blight and a deficiency in the ear is visible to some extent, but these, as usual, are much exaggerated at the markets. All kinds of spring corn are more than usually promising, and will come to harvest as early as Wheat. Turnips are growing too rapidly for the hoers, and when fine weather comes much hoeing will remain to be done when the men are required in the (if possible) more important operations of the harvest. It is to be hoped that arrangement has been made to ensure a due number of workmen to meet the emergency when fine weather returns. No old hay is left, and the first cut of new (if we except Sainfoin, which has this season cut up splendidly) is very deficient in breadth and bulk. The second cut will doubtless be an abundant one. If we except a solitary patch here and there, where incipient signs of the disease are visible, the Potato is healthy and doing well. The question of the day with farmers is, will prices keep up? and we have still a few who hold back their last rick or two of old Wheat for higher prices. The favourable reports from abroad, the supplies that are reaching us more abundantly, and the knowledge that war has only partially barred our merchants from a comparatively small part of the corn-producing countries, must warn the holders of Wheat that a reaction in prices hinges on a balance, which a fine and abundant harvest at home will weigh downwards rather rapidly; and a moderate harvest would barely counterbalance the prospect of a good foreign supply. *H. A.*

Notices to Correspondents.

Flax: *Anon.* From 40 to 50 stones of the fibre, and 18 to 20 bushels of the seed, are a good crop.

White Mustard: *M.* Sheep eat it readily; perhaps some correspondent will state his experience of it with cattle or horses; we have not known it given to them.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London.
Drawings forwarded by post.

REAPING MACHINE.
WILLIAM DRAY and CO.'S Book of Testimonials from purchasers of their Patent Reaping Machines, also a List of Prizes, and full description will be forwarded, post free, on application to
Wm. Dray & Co., Swan Lane, Upper Thames Street, London.

SCYTHES.—Boyd's Patent Self-Adjusting Scythes may be had of the Manufacturers, William Dray & Co., Swan Lane, London, and of all Ironmongers and Seedsmen.
A liberal allowance to the trade.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
First Prize Awarded to
RICHMOND and CHANDLER'S No. 3 B CHAFF MACHINE, Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, Richmond & Chandler, Salford, Manchester; and 32, South John Street, Liverpool.
☞ Catalogues Gratis.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,
is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.
PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.
Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.
Fountains of every description erected; Rockwork, Grottoes, &c.
Hose Pipe of every kind for watering Gardens.
W. F. Roe (late Freeman Roe), Hydraulic Engineer, 70, Strand, London.

FILTRATION BY ASCENSION.
RANSOME and CO., sole Patentees of the New AUTOMATON PURIFIER; also manufacturers of every variety of FILTERS (Portable or for Immersion) fitted with the Patent Purifying Medium. Pure Water, in any quantities, for Water Companies, Manufacturers, and others, obtained at a very moderate cost by the use of Ransome's Filtering Slabs. An Illustrated Priced List on application to the Depôt, Whitehall Wharf, Cannon Row, Westminster, or at the Patent Stone Works, Ipswich. A liberal discount allowed to the Trade. Filter Manufacturers and Exporters supplied with Ransome's Patent Filtering Medium separately, on the lowest terms.
Ransome & Co. are also the Patentees and sole Manufacturers of the Patent "Iris Fountains" for Drawing Rooms, Conservatories, &c.

TO NURSERYMEN AND GARDENERS.
REIGATE SILVER SAND, 12*s.* per ton, 14*d.* per bushel, or 16*s.* per ton, delivered on the London Wharfs or Railways, or within a circuit of five miles. Sacks 3*d.* each. Kentish and other Peats and Loam of excellent quality.
Kennard Brothers, Swan Place, Old Kent Road.

COWS.
HARVEY'S CELEBRATED COW DRINKS, 1*s.* each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Foot and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. Harvey, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors. Wholesale Agents, Barclay & Sons, and Marsden & Sons, London.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 5*s.* without trouble, by sending 30 postage stamps and a directed envelope to Mr. William Franklin, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

CHASE'S
BEETLE POISON.

Entirely Free from Danger to Human Life, and Perfectly Harmless to Cats and Dogs.
A Safe and most Effectual Destroyer of Black Beetles and Cockroaches; one trial alone will suffice to prove its great efficacy, and one box will destroy thousands. The great advantage in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.
Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.
Sold in boxes at 1*s.* each, by Thomas Chase, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all wholesale medicine vendors.
To the Editor of the "Cottage Gardener," July 3d, 1855.
"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*
(Ed.—This is not a mere puff, but sent to us by a gentleman who has been benefited as he states.)

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Tent, Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

TRELOAR'S COCOA-NUT FIBRE MANUFACTURES, consisting of MATTING, MATS, MATTRESSES, BRUSHES, NETTING, HORSE-HAIR, and BRISTLE SUBSTITUTE, are distinguished for superiority and excellency of workmanship, combined with moderate prices. Prize Medal both in England and America at the Exhibition of all Nations.
T. Treloar, Cocoa-nut Fibre Manufacturer, 42, Ludgate Hill, London.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence of Ealing Park, and — Collier, Esq., of Dartford.
THE BEST PROTECTOR from the HEAT of the SUN.
"FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1*s.* 6*d.* per yard run, of Elisha Thomas Archer, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

RANSOME'S SILICEOUS STONE.
THE PATENT SILICEOUS STONE COMPANY are prepared to execute Contracts for the supply of all kinds of Ornamental Details for Buildings, &c., manufactured in this beautiful material, which has received the approval of eminent architects and scientific men, and which for sharpness of outline, durability, and cheapness, stands unrivalled. It is especially applicable for the elaborate details of Mediæval and Ecclesiastical Architecture, for Gothic Windows, Doorways, Pinnacles, &c.; Crosses, Corbels, Altar Screens, Pulpits, Fonts, Monumental Tombs, Tablets, Headstones, &c.; also for all kinds of Garden Decorations, Fountains, Figures, Vases, and Pedestals, Flower Boxes, Wardean Cases, Balustrades for Terrace Walks, Gate Piers, Caps, Bases, &c. &c.; and for Coats of Royal Arms, Chimney Pieces, Brackets and Trusses, Ashlars, Quoins, String Courses, and other Dressings.—Further particulars, with illustrations, on application to Mr. Edwd. Mendham, Secretary, at the Company's Offices, Whitehall Wharf, Cannon Row, Westminster, or to Mr. F. Ransome, Patent Stone Works, Ipswich.

THE COMFORT OF A FIXED WATER-CLOSET FOR £1.—Places in gardens converted into comfortable Water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.* 2*s.*, 2*l.* 4*s.*, and 3*l.*; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A Prospectus, with Engravings, forwarded by enclosing two postage stamps.
At Fyfe & Co.'s Sanatorium, 46, Leicester Square, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

C. STEPHENSON, late STEPHENSON AND SONS, 61, Gracechurch Street, London, Manufacturer of Iron Hurdles, Fencing, &c., Improved Iron and Copper Conical Boilers and Apparatus for Warming Buildings of every description, by Hot Water.—Prices and Estimates furnished upon application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the late severe winter it only cost us 3s. per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. **Plans, Models,** and Estimates of Horticultural Buildings, or **Heating by Hot Water, forwarded on application.**

JOHN WEEKS & Co., King's Road, Chelsea, London.

Parts I. to V., in splendid folio, price 6s. each, are already published of the

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Now ready,

THE FERNS OF GREAT BRITAIN: Illustrated by JOHN E. SOWERBY. The Descriptions, Synonyms, &c., by Charles Johnson, Esq. In One Vol. cloth boards, containing 49 Plates, full coloured, 27s.; partly coloured, 14s.

NURSERYMEN'S CATALOGUES CHEAPLY AND CORRECTLY PRINTED.

S. WHITWELL, HORTICULTURAL and GENERAL PRINTER, 10, Northumberland Terrace, Bagnigge Wells Road, London, begs to inform Nurserymen, Seedsmen, &c., that he has purchased a complete assortment of New Type, adapted for the Printing of Catalogues, Seed Lists, &c., and that he is prepared to execute every description of Horticultural Printing in the neatest possible manner.

S. W. has had 14 years' practical experience in Horticultural Printing, and possesses a knowledge of Botanical Nomenclature which will enable him to print Catalogues with a degree of accuracy now seldom attained. He is printer of the "Florist," and has already been honoured with the patronage of many eminent Nurserymen, to whom he would be happy to refer.

Orders by post punctually attended to, and Estimates furnished free of expense.

NO CHARGE FOR STAMPING at LOCKWOOD'S, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9d.; Thick ditto, five quires, 1s.; Albert and Queen's sizes, five quires for 6d., 9d., and 1s.; Note-paper made from Straw 2s. 6d. per ream; Envelopes, 4d. to 1s. 6d. per hundred: Foolscap paper, 7s. 6d. per ream; Copybooks 2s. 6d. per dozen. Card Plate engraved, 2s. 6d.; 100 Cards printed, 2s. 6d. Wedding orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands.—Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20s. sent carriage free. LOCKWOOD'S celebrated Nugget (Gilt) Pen, 1 doz. post free for 13 stamps.

THE LATE FLOOD AT CHELTENHAM.—On Thursday, the 26th ult., the town of Cheltenham was visited by a SEVERE FLOOD, the river Chelt overflowing its banks and causing great damage to the property of various individuals. The chief sufferers are the Nurserymen and Market Gardeners, whose land has been inundated, and their valuable stocks in some cases destroyed, and in others greatly injured. The total amount of loss to this class of property has been estimated by Messrs. Wheeler, of Gloucester, at nearly 1000l., of which the large sum of 520l. falls upon one individual, Mr. Charles Hale Jessop, alone.

Subscription Books have been opened, and it is thought that the sympathy felt in Cheltenham for the sufferers may also, through this medium, be shown in other parts of the kingdom, especially as Mr. Jessop's name and character are so widely known and esteemed. A list of Subscribers will hereafter be published in the *Gardeners' Chronicle*, meanwhile Subscriptions are respectfully solicited, which the following gentlemen have kindly consented to receive, viz., Messrs. WRENCH & SONS, London Bridge; Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. WHEELER & Son, Gloucester; or they may be sent direct to the Honorary Secretary.

Cheltenham, August 11. ANDREW PAUL, Hon. Sec.

UNDER THE PROTECTION OF HER MAJESTY'S ROYAL LETTERS PATENT.

JOSEPH PASCALL begs to announce to the Horticultural and Floricultural Public—amateur and professional, that he is manufacturing an entirely new Garden Pot, which possesses, in a cultural point of view, many permanent advantages over pots now in general use. In the first instance, it is intended to be used in the growing, forcing, and blanching of Seakale in winter; blanching Seakale, &c. &c. in the open garden; and, when not required for these purposes, it is so constructed as to be made available in the cultivation of plants of every description. These pots are manufactured in various forms and sizes, viz.—as propagating, seedling, shading, and protecting pots and pans; and are likewise admirably adapted to the cultivation of Mosses, Ferns, and many rare and choice exotic plants.—For a more detailed description see *Gardeners' Chronicle*, July 7, p. 453.

JOSEPH PASCALL, Patentee.

West Kent Potteries, Chislehurst, Kent.

WAITHMAN'S PATENT WOVEN HOSE PIPE FOR LIQUID MANURE AND WATER, in all sizes, from ½ inch to 3 inches diameter. Prices and samples sent free per post.—EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London (six doors west of the Hampstead Road).

WANTED TO RENT, from Michaelmas Day next, a SMALL FARM of from 30 to 70 Acres of good sound Land, with convenient Dwelling-house and Premises, near a Railway Station within 30 miles of London; if nearer, and in Essex, so much the better. A 21 years' lease will be indispensable; a longer one would be preferred.—Address, stating lowest terms, to Mr. RICHARD YELDHAM, Architect, 1, York Buildings, Adelphi, London.

TO BE SOLD, at Alford, in Lincolnshire, a well built LEAN-TO CONSERVATORY, with Hot-water Apparatus, Encaustic Tile-floor, Stock, Fittings, two Watering Tanks, and everything complete. It is about 19 feet by 12, and 9 high; glazed, roof with Hartley's rough plate; sides, large sheet; and door, plate. Among the Stock are about 50 kinds of the best Pelargoniums in trained plants, &c. &c. It has been erected nearly a year and a half, and the price for the whole is 70l.—Enquire of A., at the office of Messrs. Wilson & Perkington, Solicitors, Alford.

CHELTENHAM.

TO BE SOLD, by Private Contract, under a deed of assignment for the benefit of creditors, at the Nursery, Wellington Square, Pitville, Cheltenham (late in the occupation of Mr. Wm. Harris), all the well assorted stock of Evergreens and Deciduous Shrubs, Choice Fruit Trees, Favorite Flowering Plants, &c. &c. Also the Glass and other materials of the greenhouses, &c. The Premises (containing about 1 acre) may be taken with the Stock.—To treat, apply to J. C. CHESSHYRE, Esq., Solicitor, 10, Regent Street, Cheltenham.

TO GARDENERS AND NURSERYMEN.

TO BE SOLD, a NURSERY BUSINESS, established upwards of 40 years, and successfully carried on, as the present proprietor wishes to retire. The fine situation of the grounds embraces a variety of sloping banks to every aspect. There is an abundance of fine peat soil, and an almost inexhaustible supply of fine sand. There are about 12 acres of land, with the option of having more if required. The Glass erections are very extensive, and adapted for all Propagating and other purposes. A Dwelling-house, Stable, Hackney-house, Cellars, &c. in excellent condition. The Stock of Plants is select, including those recently introduced from China, California, Himalaya, Sikkim, Cape, Australia, New Zealand, and other parts. Nursery Stock. The distance is within two days' sail of London, and half that time by railway, and within half a mile of the General Railway Station of Aberdeen.—Full information may be obtained by addressing Mr. J. ROY, Jun., Ferry Hall Nursery, Aberdeen, or at 141, Strand, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, and FREDERICK MULLETT EVANS, of No. 2?, Queen's Road, West, both in the Parish of St. Pancras, and in the County of Middlesex, Printers, at their Office in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Upper Wellington Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED to THE EDITOR.—SATURDAY, August 11, 1855.

GRAND
METROPOLITAN DAHLIA AND HOLLYHOCK SHOW.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of Her Most Gracious Majesty the Queen.—The last Exhibition of the above Society for the present season will take place at the Royal Cremorne Gardens, Chelsea, on THURSDAY, August 30, in conjunction with the Grand Metropolitan Dahlia and Hollyhock Show (Open to all Exhibitors).

Lists of Prizes and the Rules of the Exhibition may be had of the Secretary, J. T. Neville, Ebenezer House, Peckham.

CHICHESTER HORTICULTURAL SOCIETY.—The Autumn Meeting will take place on TUESDAY, August 28, in the Priory Park.—Particulars of premiums may be obtained of the Secretary. H. Silverlock, Jun.

SALISBURY HORTICULTURAL SOCIETY.—The ANNUAL DAHLIA EXHIBITION, offering the highest amount of Prizes that will be given this season at any Show, will be held in conjunction with the Horticultural Society, in the Gardens of the Lord Bishop of Salisbury, on THURSDAY, Sept. 6th.—Full particulars of John Keynes, Hon. Sec.

TO NURSERYMEN AND OTHERS.

Sewers' Office, Guildhall, Aug. 2, 1855.

CITY OF LONDON CEMETERY.—The Commissioners of Sewers of the City of London, acting as the Burial Board for the said City, hereby give notice that they will meet at Guildhall on Tuesday, the 11th day of September, at 12 o'clock precisely, for the purpose of receiving TENDERS for the supply of TREES and SHRUBS for the Cemetery now being formed at Little Ilford, in the county of Essex.

Forms of Specification with Schedules, to which the prices are to be affixed, may be obtained on and after the 20th day of August, at the Office of Mr. William Haywood, Surveyor to the Commissioners, 14, Old Jewry Chambers; or at the Office of Mr. Davidson, Landscape Gardener, 36, Great Russell Street, Bedford Square. Joseph Daw, Principal Clerk.

WILLIAM BARRATT, Landscape Gardener, Wakefield.

*** Plans and Estimates furnished.

JOHN HARRISON, Nurseryman, Seedsman, Florist, Landscape Gardener, &c.

Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, Aug. 18.

GERMAN STOCKS AND ASTERS, produced from our Continental Establishment, are in full bloom now at our Nursery here at Chelsea; and we feel great pleasure in inviting all amateurs of such to their disposed inspection, which will prove the correctness of our former statements in these Papers regarding their superior quality. At the same time we beg to announce that we have a first-rate selected collection of Chrysanthemums, in good cultivated plants, ready to dispose of, as well as a very good stock of healthy Grape Vines from eyes of the best noted sorts.—John Weeks & Co., Horticultural Establishment, King's Road, Chelsea.

THE PAMPAS GRASS,
"Gynerium Argenteum."

LUCOMBE, PINCE, and Co. have now for sale a healthy stock of well established Plants of the above, which will bloom finely this autumn, varying from one to two and three flower stems. Few Plants are more ornamental than this gigantic Grass, the leaves (which are more than 7 feet in length curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from to 6 to 8 feet surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time. Prices and full particulars may be had on application to

LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.
Established 1720.

TO LOVERS OF PLANTS WITH HANDSOME FOLIAGE.

MESSRS. STANDISH and NOBLE are now sending out the fine new Greenhouse Evergreen, WEINMANNIA TRICOSPERMA, which for beauty of foliage cannot be surpassed. It was exhibited at the Royal Botanic Society's Meeting in June last, and also at the Crystal Palace. From the report of the latter exhibition, the following brief description is condensed:—"You might pass off the leaves of this beautiful plant for the fronds of a handsome Fern. They are compound and pinnate, just like Fern leaves. I do not recollect, even among Mimosas, a plant with more beautiful leaves than this." We may add that it is of good habit, and easily cultivated; and from being a native of Valdivia, it may possibly be hardy.

Strong plants, 21s. each.

The Advertisers have just published a new Catalogue, which will be forwarded free by post on receipt of a penny stamp.

The Nurseries, Bagshot.—Aug. 18.

CHOICE CINERARIA
AND
CALCEOLARIA SEEDS.

LUCOMBE, PINCE, and CO. have now ready for sending out Seeds of their very superior

CINERARIAS and CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2s. 6d., free by post.—Exeter Nursery, Exeter, Established 1720.

SPOTTED CALCEOLARIA & CINERARIA SEED.

F. and A. SMITH beg to offer seed of the above at 2s. 6d. and 5s. per packet. They obtained a Certificate of Merit from the Floricultural Society of London for a Collection of Seedling Cinerarias, from which the seed they now offer has been saved. Both Calceolarias and Cinerarias are well known to the London trade as pre-eminent in colour, habit, and form.

Dulwich, Surrey.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON and SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2s. 6d. and 5s. each; the finest quality of CALCEOLARIA is only offered at 5s.; second quality, 2s. 6d.

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, Aug 18.

CALCEOLARIA SEED.

R. PARKER has now ready for sending out Seed which he can recommend with the greatest confidence, it having been saved from flowers of the finest form and most beautiful markings, in packets at 1s. 6d. and 2s. 6d. each. Also choice CINERARIA seed saved from the finest named varieties, at 1s. 6d. and 2s. 6d. per packet. A remittance or reference to accompany all orders from unknown correspondents.

Paradise Nursery, Hornsey Road, London.

PRIZE CALCEOLARIAS.—Packets of Seed saved from the group of Seedling Calceolarias, to which a Prize was awarded at the Great Exhibition at the Crystal Palace, may still be obtained (price 10s. 6d.) by application to William Sandford, Gardener to Mr. Henchman, Edmonton.

JOHN COLE has no objection to treat with any Nurseryman for a portion of his matchless Seedling SHILLING'S CALCEOLARIAS, which have gained eight Prizes and Certificates at the Royal Botanic and National Floricultural Societies during the season.

Keyfield Nursery, St. Alban's.

SPLENDID HERBACEOUS CALCEOLARIA AND SWEET WILLIAM SEEDS.

WILLIAM BARNES has now ready for sending out a small quantity of the above Seeds, the former of which is unrivalled, and has given the greatest satisfaction to all purchasers for the last four seasons, 2s. 6d. and 5s. per packet.

SWEET WILLIAMS, grown from the same stock as the seed now offered, may be seen at the present time in full bloom at his Nursery, where they are pronounced by all who have seen them to be unequalled. 1s. 6d. per packet. Payment can be made by postage stamps.

Camden Nursery, Camberwell, London.

WILLIAM KNIGHT, Florist, &c., begs to offer the following Superb FLOWER SEEDS, saved from the best varieties, post free:—

	Per packet—s.	d.
Calceolaria, from the best spotted varieties	1	0
Cineraria, from the best new varieties	1	0
Mimulus, from a choice collection	0	6
Pansy, from 100 best show varieties	1	0
Sweet William, from 50 superb varieties	0	6
Double Daisy, from 60 choice kinds	0	6
Antirrhinum, from 100 best varieties	0	6
Sweet William, from superb double varieties	1	0

67, High Street, Battle, Sussex.

JOSEPH BAUMANN, Nurseryman, Ghent, Belgium, begs to offer the following Plants, with and without flower buds, at most reasonable prices:—

Azalea indica, good sorts, all grafted upon good stocks	Deutzia gracilis
Azalea indica, stocks	Gladiolus gandavensis
Ghent Azalea, hardy	Lilium lancifolium album
New Ghent Rhododendron	" " rubrum
Rhododendron arboreum	Kalmia glauca
Camellias	" angustifolia
	" latifolia

A. VERSCHAFFELT, Nurseryman, Ghent, Belgium, begs to offer to the Trade the following NEW GLOXINIAS ERECTA:—

Gloxinia erecta Adamas oculata	Gloxinia erecta Mars cœruleus
" Princesse de Prusse	" Hauptmann Wüthe
" C. Flaacke	" J. Schäfer
" Rex igneus	" Stellata
" rosea Castilloni	

Price, without discount, 1s. each. The plants are strong and in full bloom.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42s. each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, John Waterer has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Aug. 18.

ITALIAN RYE-GRASS AND TRIFOLIUM INCARNATUM *should now be sown for Early Spring Feed.* Sutton & Sons, Seed Growers, Reading, *have fresh Seed now ready.* Also

GRASS SEEDS for PERMANENT PASTURE.

SUPERB BALSAMS.

F. and A. SMITH beg to solicit an inspection of their splendid Balsams, now in full bloom, from which they intend to offer seed for the ensuing season.—Dulwich, Surrey.

DUTCH FLOWERING BULBS.

JAMES CARTER and Co.'s comprehensive CATALOGUE of DUTCH and CAPE BULBS, and SEEDS, for Autumn sowing, will be published on the 1st of September next, and will be forwarded, free of charge, and post paid, upon application to James Carter & Co., 238, High Holborn, London.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18s. per dozen; 5l. per 100.
ERICAS 12s. and 18s. per dozen; 4l. and 5l. per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Aug. 18.

NEW STRAWBERRY.

KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2l. per 100, 9s. per doz., free by post, to be had of Messrs. Garraway, Mayes, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.

James Kitley, Lyncombe Vale Nursery, Bath.

THOMAS BEACH, the well known Strawberry Grower, begs to inform the public that he has now ready a large stock of fine strong plants of his true BRITISH QUEEN, the same he beat the world with at the Crystal Palace and at Chiswick, and other places up to the present season, both in flavour and weight. Plants sent to any part of the world at 5s. per 100. Post-office orders on Hounslow to Mr. Thomas Beach, Strawberry Grounds, Worton, Isleworth, Middlesex.

CUTHILL'S STRAWBERRY PLANTS.—The early and hardy BLACK PRINCE, and late PRINCE of WALES, two celebrated sorts, will be sent out on and after August 15th. They are both enormous bearers, and either of them makes a most delicious and solid preserve, to which upwards of 300 families round here can testify. The Black Prince, 5s. per 100; the Prince of Wales, 7s. 6d. per 100.

J. C.'s Pamphlet on the Potato, Strawberry, Asparagus, Seakale, Rhubarb, Wine, &c. Preserve, 2s.

J. C.'s Market Gardening round London, 1s. 6d. See the recommendation of it in the "Quarterly Review." Early orders requested. Post-office orders payable at Camberwell Green.

James Cuthill, Camberwell, London.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25s. per 100. Also Myatt's British Queen, Cinquefolia, Globe, Eliza, Mammoth, 5s. per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Briton Pine, 5s. per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is Myatt's, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. Joseph Myatt, who was the originator of the variety in question.—W. Myatt, Manor Farm, Deptford.—August 18.

IMPROVED MUSHROOM SPAWN.—Patronised by many of the Nobility, the London Horticultural Society, &c. Sold in packages containing a sufficient quantity to plant 50 feet of bed for 5s., with printed description and cultural directions.

Address W. PRESTOE, Florist, &c., Basingstoke, Hants.

FERNS.

ROBERT SIM'S 16 page CATALOGUE of his GENERAL COLLECTION of FERNS may now be had for Four Stamps. Free to all previous purchasers.

Nursery, Foot's Cray, Kent.

PRICED CATALOGUE OF PLANTS.

THOMAS JACKSON and SON'S Priced Catalogue of Plants may be obtained on application. It contains Stove, Orchidaceous, Ferns and Mosses, Greenhouse, Ornamental Shrubs and Trees, Roses, and Herbaceous Plants.

T. J. & Son are offering at very low prices a large Stock of Azaleas, Camellias, Ericas, Epacrises, Helichrysums, Rhododendrons, &c., well deserving the attention of purchasers.

Nurseries, Kingston, Surrey.

WANTED,

GRAPES and PEACHES of Superior Quality. Forward to GEORGE TAYLOR, Jun., Fruit Salesman, St. John's Market, Liverpool. Terms Cash.

TO BE SOLD, two very fine healthy plants of ARAUCARIA IMBRICATA, in large slate tubs, price Twenty-five pounds as they stand.—Apply to Edward Beck, Isleworth, Middlesex.

CHOICE NEW FUCHSIAS, ETC., OF THIS SEASON.

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, is now sending out "the White Corolla'd," and "Banks," and other new Fuchsias, at 18s. and 21s. per doz. (nice healthy plants), post free or hamper and package included, or 2s. 6d. to 3s. 6d. each, for names of which see Advertisement in *Gardeners' Chronicle* of August 11th and previous Numbers.

New Verbenas of this season, 15s. per doz., or 1s. 6d. each. Choice Cineraria seed saved from the finest named varieties, 1s. 6d. and 2s. 6d. per packet, post free.

Post-office Orders are respectfully requested, with all orders (unless reference is given) payable at Marsden, Lancashire.

LANDSCAPE GARDENING, GARDEN ARCHITECTURE, AND GENERAL IMPROVEMENT OF DOMAINS, WOODS, PLANTATIONS, &c.

Charles M'Intosh, F.R.P.S., A.L.S., &c., Author of the "Book of the Garden" and other works on Horticulture, &c. Late Curator of the Gardens of his Majesty the King of the Belgians at Claremont and Brussels, and latterly of those of his Grace the Duke of Buccleuch at Dalkeith Palace.

Newcome Villa, Murrayfield, Edinburgh.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 20*l.*, without trouble, by sending 30 postage stamps and a directed envelope to Mr. William Franklin, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

COWS.

HARVEY'S CELEBRATED COW DRINKS, 1*s.* each, have been used with great success. Plain directions are given with each Drink for the treatment of most diseases incidental to Cows, for which they will be found a safe and effectual remedy. One Drink given at the commencement of the Tick, or Feet and Mouth Distemper, will perfectly eradicate it in a few days.—Compounded by R. Harvey, Veterinary Surgeon, Macclesfield, Cheshire. Sold by all Medicine Vendors Wholesale Agents, Barclay & Sons, and Marsden & Sons, London.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l.* 3*s.*

Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,

is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes in wood or iron, viz., 14 gals., 24 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s.* upwards. Metallic String from 5*d.* to 1*s.* 3*d.* per lb.

HOSE PIPING.

WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.

Manufactured only by Waithman & Co., Bentham, Lancaster.

No. 1 Quality, Inches in Diameter and Price Per Yard:—½, 9*d.*; ¾, 11*d.*; 1, 1*s.* 1*d.*; 1¼, 1*s.* 3*d.*; 1½, 1*s.* 5*d.*; 1¾, 1*s.* 7*d.*; 2, 1*s.* 9*d.*; 2¼, 2*s.*; 2½, 2*s.* 3*d.*; 2¾, 2*s.* 6*d.*; 3, 2*s.* 9*d.*

Super Extra Stout Quality:—2, 2*s.*; 2¼, 2*s.* 3*d.*; 2½, 2*s.* 6*d.*; 2¾, 2*s.* 9*d.*; 3, 3*s.*

No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d.*; 1¼, 10*d.* 1½, 11*d.*; 2, 1*s.*; 2¼, 1*s.* 3*d.*; 2½, 1*s.* 6*d.*

The Hose is Burnettised at an extra charge of 3*d.* per yard.
Union Joints, Branch Pipes, and Jets are also supplied.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvas, for Wall Fruit.—At EDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by Barnard & Bishop, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

HORTICULTURAL WORKS AND HOT-WATER APPARATUS MANUFACTORY.
Kensal Green, Harrow Road, London.

JOHN TAYLOR and SON beg to call the attention of the nobility and gentry to the very superior manner in which they Erect all kinds of Conservatories, Vineries, Greenhouses, &c., combining every improvement with elegance of design, and durability of materials and workmanship.

Their VENTILATING APPARATUS for the Fronts and Roofs of Houses has given the highest satisfaction. Churches, Chapels, Schools, Entrance Halls, Public Buildings, &c., heated with Hot-Water Apparatus in a most economical and efficient manner. J. T. & Son have great pleasure in referring to numbers of the nobility and gentry by whom they are extensively engaged.

J. OVERALL begs to inform the Nobility, Gentry, Nurserymen, and others requiring Horticultural Buildings, Lights, and Frames, that by intrusting their orders to him, they may depend upon first-class workmanship and good materials at the most economical prices.

J. Overall, Horticultural Builder, 16, Shacklewell Lane, near Kingsland, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Patent Hothouse Works, King's Road, Chelsea.

These Patent Horticultural Buildings are superior to all others, wood being used for the frame work, but covered with Galvanised Iron Sashes, and all completed for 1*s.* 3*d.* per foot super. Hundreds of references can be given, and Printed Price Lists sent.

TO HORTICULTURISTS.

TO BE SOLD, a modern built GREENHOUSE, 26 feet by 16 feet, in excellent repair, with Stand complete.—For particulars apply to Messrs. Thew & Son, King's Lynn.

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Rickstands, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.

Ornamental Wire Flower Stands, Pot Trainers, Rose Tree Guards, Flower Bordering, and every description of Wire Work, both plain and ornamental.

Hand Glass Frames, Cast and Wrought Iron Flower Stakes, Garden Arches, &c.

Strong Iron Hurdles, and best Wire for Strained Wire Fencing.

Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

IRON GATES, HURDLES, FENCING, ETC.

J. BULLOCK and CO., Hope Iron Works, Primrose Street, Bishopsgate, Ironfounders and manufacturers of the above; also Verandahs, Conservatories, Staircases, Iron Roofs, &c. N.B. Iron and Wire Fences fixed in all parts of the country by competent workmen, or the materials supplied painted or galvanised ready for fixing, and packed for shipment. Estimates on application.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY and GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are 40 ft. wide and lofty dimensions, in length 1000 ft. and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the last severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *our Boilers*, and any part regulated at pleasure. Plans, Models and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

COTTAM AND HALLEN, Engineers, Founders, &c.,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

The Trade supplied.—Nursery, Hammersmith.

SEEDS FOR PRESENT SOWING.

JOHN CATTELL has the following now ready to send out, post free, at the prices annexed. The CALCEOLARIAS are very superior, and warranted to give equal satisfaction to those sent out by J. C. for so many years.

Per packet.—	s. d.
Calceolaria, saved from the finest vars., carefully hybridised	2 6
Do. from an entirely new class, of very rich colours, large, and extraordinary fine blooms	5 0
Cineraria, from finest varieties...	2 6
Geranium, from first rate florist varieties	1 0
Do. do. fancy varieties	1 0
Schizanthus retusus and albus, each	0 6
Anemone, single Poppy, extra fine	0 6
Mimulus, from finest varieties	0 6
Mignonette, New Giant	0 4
Alstrœmeria acutifolia, splendid scarlet conservatory climber	1 0
Do. Van Houtte's, superb Chilian hybrids, mixed	0 6
Tropæolum tricolorum grandiflorum	1 0
Heartsease, from fine named varieties	1 0
Helianthemum, or dwarf rock Cistus, from 30 vars., mixed	0 6
25 varieties, fine showy hardy Annuals, for early spring flowering, in the open ground	5 0
12 varieties, from showy half hardy Annuals, for early flowering, in the greenhouse	3 0

A remittance in stamps or otherwise must accompany orders from unknown correspondents.—Nurseries, Westerham, Kent.

CHOICE FLOWER SEEDS FOR PRESENT SOWING.

BASS AND BROWN beg to offer a few choice FLOWER SEEDS for present sowing, as under:—

GREENHOUSE PERENNIALS. Per packet.—	s. d.
Calceolaria, very choice ...	1 0
" from new varieties	2 6
Calandrinia umbellata ...	0 6
Geranium, choice	1 0
" very choice new vars.	2 6
" finest mixed scarlet ...	0 6
" do. fancy varieties ...	1 6
" Zonale, white bedding	0 6
Gloxinia, choice, mixed ...	0 6
" new and choice vars.	2 6
Heliotropium, best, mixed	0 6
Ixia, mixed	0 6
Lobelia erinus grandiflora	0 6
" Limburgensis, ex.	1 0
Lophospermum scandens...	0 6
Latus Jacobeus	0 6
Mandevillea suaveolens ...	0 6
Nycterinia selaginoides ...	0 6
Petunia, new and choice ...	1 0
Primula sinensis, mixed ...	0 6
" denticulata ...	1 0
Silene orientalis, for bedding	0 6
Streptocarpus Rexi ...	0 6
Verbena, mixed, choice ...	1 0
" choicest new ...	2 6
Vinca rosea	0 6
" " alba	0 6
Anemone, new Russian ...	0 4

GREENHOUSE PERENNIALS. Per packet.—	s. d.
Antirrhinum, choice named sorts	0 6
Aquilegia, three choice varieties, each	0 6
HARDY PERENNIALS.	
Carnation, fine showy ...	0 4
" ex., from 400 vars.	2 6
Cistus Rock, splendid, mixed	1 0
Delphinium elata, bicolor, magna, and alba, each ...	0 6
Dianthus Dunnetti, superb dark dwarf Sweet William	1 0
" nanus, new and fine vars.	1 0
Gaura Lindheimeria, new	0 6
Gentiana, three fine vars.	0 6
Gladiolus, fine early ...	0 6
" from choice, named	1 0
Iris, English, splendid vars.	0 6
" " from named do., superb ...	2 6
Lindheimera Texana ...	1 0
Mimulus, mixed, choice ...	0 6
Pansy, extra, choice ...	1 0
Piccotee, fine showy vars.	0 4
Potentilla, splendid, mixed	1 0
" extra, best vars.	2 6
Ranunculus, very choice ...	2 6

Free by post.

Choice Imported Stocks and various Annuals suited for present sowing, to flower early.

BASS AND BROWN,
Seed and Horticultural Establishment, Sudbury, Suffolk.

STRAWBERRIES.

NEW STRAWBERRIES.—The following fine varieties have been thoroughly proved this season, and given the greatest satisfaction, viz.:—Sir Harry (Underhill's), 2*l.* 10*s.* per 100, or 7*s.* 6*d.* per dozen; Caroline Superb (Kitley's), 1*l.* 10*s.* per 100, or 5*s.* per dozen; Omar Pacha (Ward's), 1*l.* per 100, or 3*s.* per dozen; Colonel Dundas, 1*l.* per 100, or 3*s.* per dozen; Sir Charles Napier, 1*l.* per 100, or 3*s.* per dozen; Magnum Bonum, 15*s.* per 100, or 3*s.* per dozen; and all other fine old varieties, such as Trollop's Victoria, Ajax, Ruby, Eleanor, Nimrod, Prince of Wales, British Queen, Black Prince, Prolific, Keens' Seedling, and all others worth cultivating, at 4*s.* per 100.

SEEDLING HOLLYHOCKS, not to be surpassed, saved from all the finest and best varieties now in cultivation, and such as will bloom well next season, 1*l.* per 100, or 3*s.* per dozen.

SWEET WILLIAMS, from 50 of the most select and choice varieties ever grown, 4*s.* per 100, or 2*s.* 6*d.* for 50.

ANTIRRHINUMS.—Plants saved from a most splendid collection of striped and spotted varieties, 4*s.* per 100, or 2*s.* 6*d.* for 50.

FINE SCARLET GIANT BROMPTON STOCK.—White ditto, Crimson ditto, all 4*s.* per 100, or 2*s.* 6*d.* for 50.

The Plants before mentioned are now ready for planting out, and are such that must ensure satisfaction, and the whole or any part of the above will be sent, securely packed, on the receipt of a post-office order or penny postage stamps to the amount; or 25 of any of the new Strawberry Plants can be sent by post, when the charge will be 1*s.* extra for postage.

SEEDS. SEEDS.

HOLLYHOCK, saved from all the finest and best varieties in cultivation, 1*s* per packet.

SWEET WILLIAM, saved from 50 distinct varieties, 1*s.* per packet.

ANTIRRHINUM, saved from a most splendid collection of striped and spotted varieties, 1*s.* per packet.

The True Old BATH COS LETTUCE (the best ever cultivated), 1*s.* per packet.

*** Every order must be accompanied by penny postage stamps, or post-office order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somerset.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

AMERICAN PLANTS.

Azaleas, fine named sorts
Rhododendron ponticum (good for cover).
Do. all the new and best vars.
Kalmias, Andromeda, Ledums, &c. &c.

STANDARD ROSES, of all the best varieties.
FRUIT TREES, ORNAMENTAL DECIDUOUS TREES, for Parks or Avenues, from 10 to 12 feet.
FOREST TREES, for Copse Planting, from 2 to 4 feet.
Prices given on application.

A Catalogue is in course of publication, and may be had the first week in September for two postage stamps.

The Nurseries are two miles from Godalming Station, South-Western Railway, where conveyances can always be obtained.

Milford Nurseries, near Godalming, Surrey.

BAINBRIDGE AND HEWISON, of the York Nurseries, beg to inform their friends that they are now prepared to supply the following New FUCHSIAS, VERBENAS, &c., at the reduced prices attached:—

NEW FUCHSIAS, 1855, 3*s.* 6*d.* each, or a dozen left to their selection, 36*s.*—Climax, Fairy Queen, Grand Sultan, Maid of Kent, Beauty of the Bower, Omar Pacha, Queen Victoria, Prince Albert, Mrs. Story, Empress Eugenie, Raffaelle, Snowdrop, Lady of the Lake, Water Nymph, Dominiana.

FUCHSIAS, New 1854, 1*s.* 6*d.* each, or the dozen for 12*s.*—Autocrat, Queen of Hanover, Telegraph, Vanguard, Omega, Magnifica, Charmer, Clio, Duke of Wellington, Elegans, Monarch, Ashfordiensis.

FUCHSIAS.—Good older varieties, 6*s.* and 9*s.* per dozen.

NEW VERBENAS, 1855, 2*s.* 6*d.* each.—Wonderful, Blue Beard, Lady Lacon, Commander-in-Chief, Empress of France, Florence Nightingale, Rose of England, Tyrian Prince, Eva. Other select older varieties, 9*s.* per dozen.

GERANIUMS.—Carlos, 2*s.* 6*d.*; Claudiana, 2*s.* 6*d.*; Duchess of Wellington, 2*s.* 6*d.*; Lucy, 5*s.*; Majestica, 2*s.* 6*d.*; Marginata, 2*s.* 6*d.*; Mary, 5*s.*; Regalia, 2*s.* 6*d.*; Rhoda, 2*s.* 6*d.*; Rosa, 2*s.* 6*d.*; Virginia, 2*s.* 6*d.*; Zeno, 2*s.* 6*d*; or 30*s.* per dozen. Good older varieties, 6*s.* and 9*s.* per dozen.

NEW FANCY GERANIUMS.—Cloth of Silver, 10*s.* 6*d.*; Evening Star, 7*s.* 6*d*; Exhibitor, 7*s.* 6*d.*; or the three for 20*s.* Best older varieties, 6*s.* and 12*s.* per dozen.

SUPERB NEW STRAWBERRIES,
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—Nicholson's Ajax, Ruby, Fill-basket, and Captain Cook, 6*s.* per 100; Sir Harry (Underhill's), 25*s.* per 25. Omar Pacha (Ward's), 15*s.* per 25; 1*l.* 5*s.* per 50. Prince of Wales (Ingram's), 10*s.* per 100. Scarlet Nonpareil (Patterson's), 12*s.* per dozen; 2*l.* per 50. Sir Charles Napier (Smith's), 12*s.* per dozen; 1*l.* 10*s.* per 50. Admiral Dundas (Myatt's), 16*s.* per 25; 1*l.* 10*s.* per 50. Nimrod (Pince's), 10*s.* per 100 plants.

A SELECTION OF THE BEST OLDER STRAWBERRIES.—Black Prince, 4*s.*; British Queen, 4*s.*; Eleanor, 4*s.*; Old Pine, 4*s.*; Eliza (Rivers's), 7*s.*; Surprise, 7*s.*; Victoria (Trollope's), 4*s.*; Goliah (Kitley's), 4*s.*; Bicton Pine (White's), 5*s.*; Keens' Seedling, true, 4*s.*; Old Rosberry, 4*s.* per 100 plants. Box included. The above prices will be reduced whenever a reduction is made by the raisers. A descriptive Circular of the above sent on application. A Post Office Order payable at Yarm, Yorkshire, is requested with the order.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*; 50 plants, 12*s.*; 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. LINDLEY describes it as being exhibited at Chiswick, July 11, 1855:—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle*, Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"WARD'S *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

"SIR HARRY."—To this STRAWBERRY has been awarded at all the Horticultural Exhibitions the highest honours, where it has competed, namely:—

1854.—Chiswick, first class certificate: 21, Regent Street, highly commended: Botanical Gardens, Edgbaston, first prize.

1855.—Edgbaston Botanical Gardens, first prize, in pots (forced); Handsworth and Lozells, Hampstead Park, first prize (forced); Edgbaston Botanical Gardens, first prize—the Judges declared it the best Strawberry in every point on the table, superior to Keens' Seedling, Cremorne Seedling, British Queen, Mrs. Trollope, &c.; Lancaster, first prize, and pronounced by the Judges to be the finest and best tasted Berry in cultivation; Preston, first prize: Carlisle, first prize: Wolverhampton, first prize, and certificate of merit; Watford, first prize: Aylesbury Horticultural Society, first class certificate.

Plants are ready for sending out (not less than a score).

Prices:—100 plants, 4*l.*; 80, 3*l.* 13*s.* 6*d.*; 60, 2*l.* 16*s.*; 40, 1*l.* 18*s.*; and 20, 1*l.* Plants may be had in pots (not less than 10), at 2*s.* each.

Apply to Mr. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham. Each application to be accompanied with a Post Office Order (on Birmingham), to receive attention.

For the Cultivation of Strawberries, refer to Mr. Underhill's Treatise, which may be obtained from a Bookseller in every principal town, where also may be obtained a handsome Lithograph of a plant of "Sir Harry" in full bearing.

The Gardeners' Chronicle.

SATURDAY, AUGUST 18, 1855.

WE once more return to the subject of BOTANICAL GARDENS. Let it be determined that such an establishment should contain:—1. A general collection of hardy plants arranged according to the best botanical system. 2. An arboretum spread over an ornamental portion of the garden, shrubbery, or promenade. 3. One or more houses for plants which will not bear the climate. 4. A private propagation and reserve ground. The next question is: what proportion of ground should be allotted to each department? as preliminary to the ultimate determination of what plants each should contain.

The course which, judging from the results, would appear to be the most generally adopted is this: Let us have every hardy plant we can procure, let us lay out the whole garden as ornamentally as we can, let us have as many houses as we can procure funds for building and fill them with as many plants as we can cram in, and if, after that, our collections starve and perish from neglect or overcrowding, the fault lies in the miserable pittance we are allowed for maintaining it.

A far more rational mode of putting the question would be as follows: what are the means we have at our command? and what will they enable us to accomplish, as most conducive to the object in view? When that is determined, let us strictly confine ourselves to that, and attempt no more. Let us enter into no additional outlay, nor enlarge our collection, without first ascertaining that by additional funds and space, or by retrenchment in other departments of the garden, we can maintain these additions in a state of useful health and vigour.

I have known botanical gardens possessing a large acreage with annual allowances wholly insufficient to keep the ground tolerably neat, even in the cheapest form of shrubbery and walk; and as even here it was considered necessary for the character of the garden to make some attempt at maintaining the plant-houses and botanical collection, the greater part of the ground had become a mere wilderness of weeds. In such cases the only course to pursue is to reduce the ground to manageable dimensions, by setting out a portion as kitchen garden, pasture, or some such culture, which will pay its own expenses, until better times shall enable it to be taken into the botanic garden.

Having thus no more ground than can be kept in order, it is again in the first instance a matter of calculation what proportion can be taken for the botanical collection: the result will vary according to local circumstances, the elements of calculation

being the total acreage, the total annual sum available, the annual cost per acre of maintaining the pleasure garden, that of cultivating the botanical border (including in each case its corresponding reserve and propagation ground), and the annual expense per given measurement of hothouses and greenhouses. Where the means are very limited the plant-houses, especially the hothouses, must be first sacrificed, not by neglecting them, but by shutting up a portion or even the whole if necessary, and the botanical borders must then be restricted within the narrowest limits, the mere ornamental garden being the cheapest to maintain. As the available resources become more ample the botanical ground may be gradually expanded till it is capable of containing as full a collection as can be procured of instructive species that will bear the climate, provided the ornamental ground will bear being so far encroached upon. If, however, additional space is obtained with the increased funds, the arboretum may also be enlarged, even to a greater extent than the botanic garden. But it is the plant-house cultivation that must always derive the greatest benefit from the improved condition of the funds. The limits to which this department may be carried will indeed depend solely on the pecuniary means, for in no garden that I know of are the houses at present too large to contain the collections that might be usefully maintained in them with ample funds.

The extent of the reserve and propagation ground will be fixed in the first instance by the requirements of the scientific and ornamental departments which they are destined to supply; but they must also, in a botanical garden, contain more or less extra space for raising and testing new importations, for carrying on physiological experiments, or for the temporary cultivation of plants for any other scientific purpose, under the eye of the director or curator without the interference of the public. The exact proportion of ground to be devoted to these extra purposes will be limited either by the space available without detriment to the more important divisions of the garden, or by the demand of the director or curator who may have time, inclination, or capacity to avail himself of it.

Opinions are much divided as to the propriety of keeping the botanical and ornamental gardens distinct, the plants in the former being ranged in formal straight borders; or of blending them together by grouping the herbaceous collection in irregular beds. The former practice is the most prevalent on the continent, the latter generally finds more favour with us. I must confess that the separation appears best to answer the purposes of science and instruction. It is more easy so to arrange and label the plants that the principles of the system adopted may be taken in at a glance; it facilitates access to the individual specimens without trampling on the borders and disturbing the plants, and the peculiar kind of care and cultivation they require is given at less trouble and cost. On the other hand, where we devote to each natural order an irregularly shaped bed, larger or smaller according to the number of species we expect to have, and scatter these beds over a lawn in a kind of irregular flower-garden, it is a very difficult thing so to arrange them as to produce a whole agreeable to the eye. Supposing even this to be in some measure accomplished by a tasteful designer, availing himself of any irregularities of the ground or other local aids, still it is impossible to make the beds themselves ornamental if they are only to contain botanical specimens. At least half the species will have a weedy look, and there will always be gaps and empty spaces which we cannot fill up with showy flowers or extra plants for mere ornament, without destroying in a great measure the value of the collection for study or instruction. Such a moulding of botanical borders into the landscape-gardener's form appears to be justifiable only in those subscription gardens where science is the outward show, rational recreation the real object. *G. B.*

Few circumstances excite the surprise of observers more than the production of one flower by the interior of another. And yet there is no preternatural phenomenon more easily explained when the true nature of a flower is understood. That curious apparatus, with its panoply of brilliant colours, its transparency, its fragrance, and the important special duties confided to it by nature is, in the eyes of science, merely a collection of leaves in a transformed condition, and is itself but a branch stunted in its growth.

The truth of this theory is proved by the following circumstances more especially: 1. That every part of the apparatus of a flower, however unlike a leaf, will occasionally, in the presence of disturbing influences, become a mere leaf; 2, that that peculiar property of forming a bud, or rudimentary branch, in the axil, which is an especial attribute of a leaf, also belongs to the parts of which a flower consists; 3, that the floral organs stand in the same relation to each other as the ordinary leaves upon an ordinary stunted branch, such, for instance, as the rosette of a Houseleek (*Sempervivum*); and 4, that a flower will occasionally grow into a branch leaving its petals at the base.

The first case is illustrated by the green-flowered Primroses, proliferous Plantains, and those Potentillas whose flowers become in hot weather tufts, or rosettes, of leaves. The second by little branches shooting up from among the parts of the flower, as in the Pear tree, which will occasionally form two or three little Pears in its inside, each of which is traceable to the axil of some one or other of the floral parts, and by the common occurrence of a brood of little Roses starting up from among the petals of a common Rose. The third may be seen by any one who compares the rosette of the Houseleek with a double Camellia, a double Ranunculus, or a double Anemone. Of the fourth we have instances in Pears and Apples producing a branch from their centre, and in Roses such as that of which a figure was given the other day at p. 516.

In all these instances the secrets of floral structure are revealed by accident to the eye of intelligence. Nor have artists failed to profit by them, as we see in the carvings and scroll work of the sculptor and the architect. Even the curious fact that one flower will grow out of another has been seized upon by them for the purpose of decorating the points of separation of branches, and this in a manner which, however conventional, is perfectly consistent with the true forms of Nature.

Nowhere, however, has the tendency of one flower to give birth to another been shown in a more unexpected manner than in the case here illustrated. In the aquarium at Syon House it was observed a few weeks ago that the beautiful Water Lily called *Nymphæa Devoniensis* had produced a flower from the midst of which rose another Lily like itself, hanging gracefully at the end of another stalk.

When flowers thus become proliferous it usually happens that the whole central system lengthens, as is shown in the Rose already alluded to, the metamorphosed branch merely reverting to its original condition and lengthening by the point always represented by the centre of the flower. But in this instance the mode was changed, and the new flower with its stalk proceeded directly from the axil or base of one of the stamens, as is seen in fig. A, which represents a section of the flower rather magnified. The Nymphæa therefore belongs to the examples which are to be included in the 2d of the four classes mentioned at the commencement of this article, and it is by far the most striking instance of the kind yet on record.

But the disturbance of the natural condition of this Water-lily was by no means confined to the production of a second flower. On the contrary, it extended to the innermost organs, and forced the very stigmas to grow up into small green leaves, folded up, as they always are in the young bud. Two instances of the kind are shown in fig. A.

This monstrosity, for a monster it is, serves to illustrate a very important truth which those who are engaged in works of decorative art should never lose sight of. Any amount of departure from the strict forms of plant-objects is allowable in a conventional mode of representation, provided that departure is consistent with the rules by which is regulated the development of the plants to be represented. These rules constitute the theory of structure which every decorative artist ought to understand thoroughly, and the case before us shows how it may be applied in a direction which was perhaps very little expected. Flowers may be made to grow out of flowers, with perfect propriety when the exigencies of art demand it; although leaves cannot be made to grow out of leaves without violating the first principles of vegetable structure, and thus offending the educated eye by the production of that which is wholly irreconcilable with truth or possibility.

We announce with much regret the decease of Mrs. Lawrence, of Ealing Park, whose name has so long been honourably associated with the progress of modern gardening; and who for many years stood almost without a rival at the great flower exhibitions at Chiswick. The sad event occurred suddenly at midnight on the 14th inst.

EXHIBITION OF THE IMPERIAL SOCIETY OF HORTICULTURE OF PARIS.

(*Continued from p. 500.*)

The cut flowers are exhibited in the Pavillon Chinois (No. 8 of the plan), a raised structure tastefully built under the thick shade of the old Champs Elysées trees, with a long double T shaped table along the centre, and narrow tables and glass cases round the ends and back. These flowers have consisted chiefly of Roses, of which an abundant supply has been kept up for the last two months. Amongst them there has always been an

siderable variety, and good specimens of several of the kinds most admired with us, but in general little of novelty, and I cannot mention any as having appeared superior to our own. M. André Leroy's Magnolia grandifloras, exhibited last month, deserve especial mention for the enormous size of some of the varieties; there have also been Gladioli, Phloxes, Pinks and Carnations, &c., and in the earlier days some very fine boxes of double Ranunculus and Anemones.

In the same building there has also been kept up a succession of specimens of fruits in season, with occasionally a very few forced ones; but the permanence of the exhibition is a decided obstacle to the sending to it any valuable fruits that might suffer from a week's exposure. What we see here can, therefore, supply no criterion of the state of fruit cultivation in the neighbourhood. The show of forced fruits—Pine Apples, Melons, &c. — and even of Strawberries and other smaller fruits, has always been better in the shops of some of the great dealers, or in the windows of the show-restaurateurs, than on the tables of the Pavillon Chinois at the Exposition. In general the fruit market in Paris appears to have undergone but little alteration for many years past. There is still the same comparatively small demand for, and consequently supply of, forced fruits; and although early vegetables appear to be rather more prized than early fruits, still the generality of Parisian *bon-vivants* have the good sense to acknowledge that to have either in perfection they must be such as are truly in season, and they seldom commit the folly, so common with us, of giving enormous prices for indifferent fruits, merely because they are out of season and consequently rare. The cultivation of some pit fruits, especially Pine Apples, has, however, so much increased of late years as to be an important addition to their depôts, and Strawberries have been finer and more abundant than I ever recollect them. We have now had them constantly since the commencement of June: the larger varieties introduced from England within the last few years were selling, during the whole of July, all over the streets of Paris in immense quantities, at 1½*d.* to 2½*d.* the pound; and the small Alpines, which used to be the only ones cultivated, and are still so highly prized for their flavour, were in the markets when we arrived two months ago, and will now go on for at least two months more. Raspberries have been excellent, and very plentiful. Cherries also plentiful, but moderate in quality. Gooseberries few and little cared for. Apricots very abundant; the common ones very poor, but excellent at the good restaurateurs. Green Almonds were much eaten last month. Melons are now plentiful and good—all, as of old, the Red-fleshed Cantaloupe. Figs are just now coming in, and already very good; and the best restaurateurs begin to show some fine baskets of Peaches and Nectarines, with a few of the earlier Grapes.

But to return to the Pavillon Chinois. Some very fine Oranges and Citrons from Algeria were exhibited there in June and July, together with good looking Apples and Pears from the same colony, and at our first visits to the Exposition we saw several baskets of very well preserved Apples and Pears from some of the Parisian fruiterers. A large dish of Eriobotrya japonica was sent up from Hyères by M. Rantonnet, and a few other southern fruits from various sources.

Among the roots exhibited, the most interesting were the new Japanese Yams (Dioscorea Batatas) from M. Paillet of Paris. This esculent has not yet, however, got into the market, and horticulturists here are by no means so sanguine as to its advantages as published accounts would lead us to believe.

The wax and other models of fruits occupy a great space in the pavillion, and are generally beautiful. There are large collections of miscellaneous European fruits from four different Parisian exhibitors, the comparative merits of which would require a strictly juridical examination to determine; but M. Lédion's basket, presented by M. Chevet, struck me as peculiarly good. M. Humbert de Molard has sent specimens of a very remarkable set of models of Mauritius fruits, well known as having been offered to the Museum of the Jardin des Plantes many years ago, at a price which the museum then considered exorbitant; but it is said that it might now be obtained for a much more reasonable sum, and the collection is certainly worthy of a place in any large museum. It gives an excellent idea of the different species represented, although one is at first tempted to think them on a rather too large scale, especially those placed on the central table illustrating the Jack fruit, the Cocoa-nut, and its germination, and the Amorphophallus (introduced into the collection as a curiosity), which attract much attention from the public. The whole of the models are, however, evidently done from nature, and in some which are better known to us there is certainly not much exaggeration.

Vegetables are chiefly exhibited out of doors, along the edge of two of the narrow fruit-tree beds (Nos. 17 and 18 of the plan). Laid down on the soil under the shade, and half imbedded in Moss as they were in June and July, they kept up their freshness and consequent good looks much better than they do now when Moss appears to have become scarce and the sun more scorching. They have generally been fine of their kind, especially the Artichokes from Niort, and Vilmorin-Andrieux's Lettuces. Tomatoes and Aubergines (Solanum Melongena, with long purple fruits), remind one also of a southern climate; on the other hand the Cabbages have been such as would scarcely be looked at in any of our cottage shows.

The Pavillon or Tente d'Industrie (No. 23 of the plan) is a shed of considerable dimensions, in which are displayed various implements, manufactured articles, industrial products or other objects more or less connected with horticulture, but which, strictly speaking, would belong rather to the general Industrial Exhibition. Most of them are indeed repeated in the Great Palais d'Industrie, and in greater perfection. The chief articles here admitted are:—

Horticultural pottery, usual and ornamental, amongst which the elegant forms of Follet's and of Legendre's collections are conspicuous.

Stands, baskets, and other horticultural ornaments in iron, in wire, in wicker-work, &c.

Chairs, seats, and other garden furniture, none of them superior to those of the Usines Tronchon now in such general use in and about Paris.

A considerable variety of small heating apparatus and propagating frames, several of the latter very complete and compact for amateurs' cuttings on a small scale.

Mats, screens, and blinds, of various descriptions. Some of the blinds made of slight laths are very neat and light, and are much used in this neighbourhood for shading plant-houses.

Garden tools and implements, and large assortments of horticultural cutlery.

Garden labels of a great variety of materials—metal, china, and glass; but I observed nothing new of importance, not even in those which are conspicuously announced as "ne laissant rien à désirer," in point of solidity of the label and permanence of the writing.

Horticultural books, journals, drawings, plans, &c.

Small collections of Algerine agricultural products, textile plants, and other objects exhibited on a large scale in the Palais d'Industrie, for which we see but little reason for a repetition here.

A few of the larger implements, blinds, ornamental tubs for Orange trees, vehicles for moving them, &c., are exhibited outside the industrial shed. There is also a small specimen of the peculiarly elegant description of fountain, of which a larger one in the centre of the long Annexe of the Palais d'Industrie is so generally admired. The middle of the basin is occupied by a gigantic tuft of flowering aquatic plants, exceedingly well imitated in painted copper, with numerous jets of water issuing from the tips of the leaves, spikes, or buds.

Lastly the aviary of the Usine Tronchon (No. 53 of the plan) is a very elegant one, with flowering creepers up its angles, surrounded by a bed of two or three concentric rings of flowers, and inhabited by a variety of little birds, cardinals, widow birds, &c., whose bright plumage glittering in the sun is well shown off by the green foliage intermixed with flowers surrounding them, and proves a point of great attraction to visitors.

In the flower exhibition, the chief changes which have occurred during the last three weeks are the substitution of Pinks and Carnations for many of the Pelargoniums and other earlier flowering plants. Verbenas are beginning to appear, and M. Dufoix has already a numerous collection of good varieties. Hydrangeas continue to make a great show and are less uniform in colour. One large bed, including many blue ones, is well shown off by a double ring of dark-coloured Cockscombs surrounding it. Foras's collection of Fuchsias under the Pavillon Chinois is in full beauty, small low specimens, but compact and well flowered, with many very good varieties; I especially admired some with the petals and calyx both pink, but of different shades. In one of the annual beds the red Linum grandiflorum has been making a great show, although not of so rich a colour as I have seen it in southern gardens. Vilmorin's bed has a remarkably pretty row of very dwarf China Asters covered with flower, and his Portulacas and Brachycomes are very showy.

In the houses the only new thing I have noticed is a very pretty hybrid Achimenes spotted with a brownish colour in a very unusual manner. It is exhibited by Verschaffelt, of Ghent, who appears to have given it his own name.

The Exhibition continues to be well attended, especially on the Sunday, when the admission is reduced to half-price (50 centimes), and certainly nothing can be more agreeable than an hour's lounge there in the cool green shade; the verdure does not, indeed, appear to have suffered as yet, either from the dust raised by the great traffic of the neighbourhood, nor from the blight which has already turned brown and almost stripped so many of the Lime trees in the Tuileries, the Luxembourg, and the Jardin des Plantes. *Paris, Aug. 6.*

VEGETABLE PATHOLOGY.—No. LXXXIV.

353. Carpomania (*Phytolithes, grittiness*).—In the Plum disease, described in the last number, the endocarp, which is in its normal condition hard and woody, was reduced to a thin membrane, and detached from the sarcocarp: in the present instance the malady is confined to the sarcocarp, the cellular tissue of which is affected more or less according to the urgency of the case. The disease—if such it may be called, for it is only an aggravation of a condition which exists normally, and is intimately connected with the peculiar structure of the cellular tissue—is common to Pears, Quinces, Medlars, and similar fruit, but is not found in Apples, though so nearly related. It consists in an induration of certain parts of the cellular tissue, which if confined to minute detached points produces the gritty texture so common in Pears, and which is often betrayed, as in the Crassane, by the grating of the peel under the knife when pared, but if extending to many contiguous cells, generates gravelly masses which are large enough to justify the denomination of stones. Perhaps no single variety is absolutely destitute of these bodies, which exist often beneath the cuticle and in the neighbourhood of the tissue which immediately surrounds the carpels, but sometimes are scattered through the whole of the sarcocarp. The subject was circumstantially described by Grew in his "Anatomy of Plants," and afterwards by Duhamel; an elaborate memoir was read before the French Academy by Turpin, in 1838, but not published till 1840, containing much interesting matter, and accompanied by copious illustrations, but unfortunately holding forth many very erroneous views. He regarded the indurated cells, for instance, as crystals marked with many radiating wrinkles and a central scar, a statement which will be seen presently to be wholly at variance with truth. Corda also examined the subject, and published his observations as I believe in the "Œkonomische Neuigkeiten," but unfortunately I have not the portion of the work in which the memoir is contained; Meyen has described these bodies in his "Pflanzen-Physiologie," and illustrated the indurated cells at tab 1 fig. xi.; and finally Payen has figured their structure, as well as that of the neighbouring and connecting cells, in his "Organographie et Physiologie Végétale," published in the 22d volume of the Memoirs of the French Academy. If the figure of Grew be compared with those of Turpin and Payen, it will be found that it is very correct considering the imperfection of the microscope at the end of the seventeenth century, while Turpin failed rather in a misinterpretation of what he saw than in seeing incorrectly. If the sarcocarp of an Apple be compared with that of a Pear it will be found that the cellular tissue of the former is uniform, except where it is threaded by vascular bundles, while in the latter there are little scattered patches of sub-globose cells from which proceed in every direction elongated, radiating, simple or divided sacs which are necessarily much broader above, where they come in contact with the neighbouring cells which separate them from another similar system, than below.* The walls of the sub-globose cells may remain thin as in the others, but there is a tendency in their walls or protoplasm to deposit layer upon layer of ligneous matter till the whole becomes a solid mass with the exception of a minute cavity in the centre from which proceed to the outer walls numerous canals by means of which, as in so many vegetable tissues, communication is kept up between the contents of cell and cell (the scar and radiating wrinkles of Turpin), and it is evident that in proportion to the number of cells thus affected and their degree of attachment to each other, either a gritty sensation will be produced on eating the ripe fruit, or it will be found filled with stony masses so as to be absolutely uneatable. In wild Pears the presence of these masses renders the fruit worthless, independently of any natural roughness or acidity, and in many inferior varieties the same condition exists, while even in some of the highest flavoured sorts, the grittiness is so great as seriously to impair their value. The gritty or stony portions are of course destitute of sweetness because the amylaceous or gummy contents are converted into xylogen instead of sugar and pectinous matter, but the neighbouring softer tissues are not necessarily exhausted, as each individual cell in a certain sense lives for itself. In great measure the condition is constitutional, but it may be increased by any cause which retards or checks the growth. Pears, therefore, if deformed or otherwise dwarfed are unusually gritty, and the same may be said of the finest varieties if subjected to unpropitious weather or dry meagre soil; and these conditions are true of Medlars and other fruit subject to the same affection. I have observed that in cases where the epidermis of a Pear has been devoured by insects, when a new coat is generated, there is the same layer of gritty cells beneath it, as under the original cuticle. The acid portion of the Pear, called by Grew the acetary, which surrounds the carpels and is frequently isolated by a thick gritty stratum from the rest of the sarcocarp, consists of a nearly uniform tissue like that of the Apple, and is in general free from these indurated cells. Treviranus has in consequence imagined that they bear some relation to the quantity of sugar existent in each particular fruit. This, however, does not seem to be supported by facts, any more than his assertion that they are glandular bodies. The coats of the cells are merely thickened, as in a thousand other cases, and there is no necessity for regarding the cells as possessed of any peculiar character. It has been supposed further that the extreme grittiness of the Quince in Italy, where the fruit is in general nearly worthless, arises from the immense quantity of seeds which are brought to perfection in that country. Ré reports, on the authority of the Abbé Molini, that two kinds of Quinces occur in Chili which are destitute of these stony concretions, but except it were certain that they belong to the same species or variety as that cultivated in Italy, no argument can be deduced from the fact. *M. J. B.*

* I do not find the structure so regular as in Payen's figure, at least in the Glout Morceau. It is, however, essentially the same in all cases, and the quality of the fruit in many instances depends ultimately on the degree in which the intermediate connecting tissue is developed. The indurated cells are distinctly angular, as is the case with all closely packed globular tissue.

PITCHER PLANTS.

Where these plants are required to be grown to make fine specimens, they must have plenty of pot room; and the more vigorous the species, the larger the

pots that will be required. The soil for potting should consist of equal parts of fibrous peat and sphagnum cut short, with a little sand, the whole intimately mixed together. Some persons are afraid to repot their Pitcher Plants after they are once established; but I never experienced any injury from doing so. The best time for potting is about the month of March. In doing it, the pots in which they are should be broken, and the ball of roots carefully put into the larger pot, the soil being filled in all round nearly level with the top of the pot; then over the soil put a little living sphagnum, cut short and made level, so as to have a neat appearance. After this is done, give them a good watering with a fine-rosed watering-pot to settle the soil. The pots, in all cases, must be well drained with broken potsherds.

They should be placed at the hottest end of a stove, or Orchid-house, where a bank of Moss can be made of the size required in which to plunge the pots up to their rims, and deep enough to allow 2 or 3 inches of Moss under the pots, to prevent them from drying. A few holes made through the slab to allow the hot air to pass upwards through the Moss, thereby to cause continual evaporation about the plants, will prove beneficial. Particular attention must be paid to moisture. After they are repotted in March, they will require watering with a fine-rosed watering pot, and the Moss in which they are plunged must be well saturated about twice a week; and the plants should be syringed over head three or four times a day. As the summer advances, and the sun acquires greater power, they will require to be syringed oftener. When the temperature has risen under the influence of solar heat, in May, June, and July, perhaps to 80° or 85°, they will require syringing a dozen times a day. The rule is, the stronger the heat the oftener they will require syringing overhead. As the heat declines, decrease the moisture by degrees. In winter, if the weather is dull, syringe about once a day; but if there is a little sun, twice or three times; and the Moss in which they are plunged should be well saturated about once a week. They must be shaded from the burning rays of the sun. I would recommend to have the glass over them painted with a little thin paint to prevent them from burning, as they are very liable to get injured in that way before the other plants in the same house require shading.

Pitcher plants, if grown in perfection, like a hot moist atmosphere. In summer the temperature should vary from 75° to 80° by day, and at night from 60° to 70°. In winter it should vary from 65° to 70° by day, and at night from 55° to 60°. The sphagnum on the top of the pots around the plants must be kept growing, and frequently clipped with a pair of scissors; and the Moss must be replaced when required, in order to keep them always plunged up to the rim. They have been considered rather difficult things to manage, but by following this treatment they will be found to thrive, and will grow without difficulty. They are propagated by cuttings. *Alpha*

HITCHAM VILLAGE HORTICULTURAL SOCIETY.

The first meeting of this Society was fixed for July 11, but as it rained most incessantly it was postponed to the following day. The severe winter told manifestly upon the cottagers' productions, but they sent in what they had, and a very fair show was the result. The following programme will show the "orders of the day:"—

HITCHAM HORTICULTURAL SHOW.

Programme for Wednesday, July 11th, 1855

8 to 10 A.M. Specimens for competition sent to the rectory before 10 A.M.

9 to 10 „ Children to prepare their Wild-flower Nosegays at the rectory.

12 A.M. "Marquee Museum" ready for inspection.*

1 P.M. Show of flowers, &c., ready for inspection.

Lectures on some of the objects in the Marquee Museum will be given at intervals.

4 „ Prizes distributed. Various prizes. Announcement of Village Excursion down the Orwell.

5 „ Stewards to return specimens on receiving their check tickets from the exhibitors.

6 „ Tea, orderly and sociably, as usual.

8 „ The School Children to sing "All to join in" God save the Queen," "Good night," and may we continue "merry and wise" till and at the next Show, fixed for September 19th.

Animal Kingdom.

Mammalia.—Skin of red monkey of Bolivia; peccary of S. America; paradoxus of Phillippine Islands.

Birds.—Albatross, which had followed a ship 3000 miles before it was shot! Rhinoceros hornbill; Impeyan pheasant; resplendent trogon (male and female). Glass case of handsome small birds, and another of humming-birds (exhibited by Mrs. Henslow, of Bildeston).

Reptiles.—Monitor of the Nile; thorny lizard; five Jersey toads; and five Suffolk natter-jacks.

Fish.—Globe-fish; porcupine-fish; flying-fish; jaws of a large shark.

Mollusks.—A few sea-shells; and one land-shell species new for Hitcham (Helix carinata).

Insects.—Case of foreign insects, tussar cocoons, the wild silk of the East Indies; Suffolk wireworms and the beetles they produce.

Vegetable Kingdom.

New list of Hitcham wild flowers.

Dicotyledons.—Section of a Cork tree, grown at Chelsea. Fruit of Cachew-nut with swollen fruit-stalk larger than the neck of the bottle in which it is preserved. Fruit of Towel-gourd, used as sponge and for wadding; ornamental Gourd-box from Madagascar; ornamental Calabash-gourd apparently from South America.

Monocotyledons.—Palm oil with the (1) Glycerine and (2) Palmetic acid of which it is composed, these having been separated by a new process, for the candles at Price's manufactory. Wheat and Barley more than 3000 years old from the catacombs of Thebes; Rice in the ear; our four native pond weeds (Duckweeds, one never yet known to flower in England).

Acotyledons.—Oak stained bright green by the Verdigris Peziza, obtained from Hitcham Wood; with a load of timber; the samples prepared at Tunbridge Wells.

Mineral Kingdom.

Garnet in mica-slate; obsidian from Ascension, and the same mineral from Vesuvius, showing the mode of its passage into pumice; various polished and other specimens of fossil wood; state of the cetacean bones from different geological formations; state of the cetacean bones from the red crag of Suffolk, contrasted with the elephants bones from gravel beds of the same county.

Miscellaneous.

Diagram specimens to illustrate the process of glass manufacture:—

1. *Implements.*—Model of pot for fusing metal, of Stourbridge clay; Newcastle clay; blow-pipe; pontil; pincelle; scissors; model of workman at his table; iron moulds; wheels of (1) iron for grinding, (2) stone for smoothing, and (3) wheels for polishing; vase of cut glass; tumbler, which exhibits the successive processes.

2. *Ingredients.*—Sands of Alum Bay, Lynn, and America; pearl-ash and potash; soda; saltpetre; borax; red lead and litharge; various combinations to form "frit."

3. *Kinds of Glass.*—Flint, crown, plate, broad.

4. *Colouring by metallic oxides, viz.*—(1) Copper for green; (2) Manganese for purple; (3) Cobalt for blue; (4) Iron for yellow; (5) Gold for red, &c., &c.

5.—*Various ornaments and uses of Glass;* among them specimens of Pitchmanship, the ladies latest hobby!

Antiquities.—Ancient iron helmet. Alabaster vessels from the catacombs of Egypt, more than 2000 years old; Roman patera of Samaria ware from Coombs, with maker's name Licinus, 1500 years old.

Russian trophies, &c.—Musket, bayonet, pistol, sword, knife, and ring, taken from soldiers at the battle of Inkerman; enamelled picture of Virgin and child with Russian inscription at the back, "Most holy mother of God of Petchais," taken from a dead officer's neck, after the battle of Inkerman; fragment of a shell which killed one boy and wounded another on board the Bellerophon.

Curiosities of savage workmanship; cap, pouch, and mocassins of North American Indians; snuff-boxes, of horn, and of insect-cocoons, by the natives of Natal, South Africa.

Carvings, &c.—Box-wood model of a frigate; wooden figures and a spectacle-case carved by the ingenious peasants of Switzerland, and worthy of imitation by those ingenious labourers of Hitcham who intend to compete for the sculpture prizes in 1856. Model of St. Peter's Church in card-board, by the son of a labourer at St. Alban's (exhibited by Mrs. Henslow, of Bildeston). All the patterns of lace, in a model specimen from Warrington.

N.B.—A person of well-known spiteful character is suspected of having cut down an ornamental Rose before Miss Raffle's house, of having injured two double clocks in a cottager's garden, and pulled up six experimental Pea plants in one of the allotments. No one wishes to hear the name of this person until such evil deeds can be clearly brought home; and then we shall all be ready to expose and shun the perpetrator of them.

As usual the marquee museum was the object of general attraction, and Mr. Henslow had to deliver two lecturettes to more than usually crowded audiences. There was one new feature introduced into the proceedings of the day, viz., the examination of Mr. Henslow's village botanical class. How many of our university students would look with astonishment to see wee village maidens (the botanists are all girls) writing down on paper the minute description of each plant presented to them! One brief illustration of the progress the class is making will suffice. Mr. Henslow gave them a flower out of his garden they had never seen. It was pulled to pieces, and its botanical characters noted down; from these the class is, of course, easily determined. The order and family, however, require more botanical knowledge to detect; and I believe was only answered by the head scholar, Showell, who noted down correctly Ord., Onagrad; Fam., Willow Herb; not only evincing considerable progress in botanical knowledge, but adding another proof, were it necessary, to the value of a natural system. The day was fine and all passed off well. *C. R. E.*

Home Correspondence.

Gooseberry Caterpillar.—I am obliged to Mr. Westwood for his remarks on my communication. He has misunderstood me. I said, or meant to do so, that the wind brought the fly, not the caterpillar, over the wall from our neighbour's garden. I readily admit that my observations upon the mould were not minute enough. It was, perhaps, a hasty inference to say that the skins were found. Some decayed leaves were also on the surface of the mould, from which it was difficult to distinguish the remains of caterpillars. How are the following facts to be explained? Eggs were seen, but not in sufficient number to account for the thousands of caterpillars—the minutest caterpillars were found on leaves far removed from any appearance of eggs; indeed it was difficult to find an appearance of eggs when there were myriads of caterpillars. My neighbour has just informed me that a brother market gardener had the pest very severely three years ago and last year, and in both seasons quite early. This year he has had a capital crop of Gooseberries, and no caterpillars. I will endeavour next year, if I live, to look well after the fly, and try by attention to the surrounding soil this autumn to extirpate our dormant enemy. ☞ ——There can be little doubt in what form these pests remain in the ground all winter. I have found them in spring in a chrysalis state, when I put them into a slender chip box, and pricked holes through the wood for air. When I neglected looking at them for a day or two, I sometimes found the insects adhering to the side of the box dead, I supposed from the want of food, and not air. Had I excluded the air at first, I suppose the fly would not have been able to eat its way out of the cocoon. The cocoons were of a brown colour, about three-fourths of an inch in circumference, and seven-eighths of an inch in length. *Wm. H. Sea—, Lartington.* ——The following is copied from the "Georgical Essays," by Dr. Hunter, vol. iii., p. 223, and may probably be of use to your correspondents who are seeking for information on the subject of Gooseberry caterpillar. [But the insect mentioned below is not "the Gooseberry caterpillar"]. "The moths (Phalænæ grossulariatæ of Linnæus) from which the Gooseberry and Currant caterpillars (which are the same) are bred, are small, having yellow bodies with many black spots, and their wings white with yellow streaks spotted with black. They appear in the month of July, in the evenings, and ought to be attentively killed by all attentive gardeners. They seldom fly far from the bushes on which they deposit their eggs. They live about 20 days, during which time they (for many of the moth tribe have not even mouths) eat little. The eggs, which are yellow, are glued below the clefts, and under the larger arms near the bottom, and sometimes on the leaves of the bushes that are proper for serving the young progeny for food. One moth produces upwards of 150 eggs. The young worms generally appear in spring, but they are sometimes hatched in autumn. I have observed the young in great numbers devouring the leaves of the Gooseberry bush as early as the 15th of August, that is about three weeks after the eggs are laid. They sometimes eat up the embryo of the new leaves and flowers of the bush in October, which renders any hope of fruit for the ensuing year abortive. Neither the frost nor snow of winter destroys them. I have taken particular notice of some of these Caterpillars remaining on a Currant bush, without being affected by cold or hunger, from November to March. During winter and the early part of spring they lurk in clusters below the clefts, and then is the time they ought to be crushed." *Richard Hinde, Lancaster.*—My bushes suffered much last year, and this season the pest reappeared in full force; but I completely cured the disease by syringing the bushes, and especially the under surface of the leaves, with sulphuretted lime water prepared as follows:—One bushel of hot lime was slaked with a little boiling water, and to the intensely heated mixture about half a pound of flowers of sulphur was added and well stirred in; then about 15 gallons of cold water were added, stirring carefully all the time. The mixture was made in the evening, and the clear liquid applied by the syringe the next day. A neighbour also tried the same plan with equal success. *H. R. M.*

Sikkim Rhododendron Falconeri.—Can you oblige me by any information as to the cause of the noble leaves of this variety being sometimes subject to curling at the edges? I have five plants, all of which have had the same treatment in every respect; they have all completed their growth; two have made five leaves each, two four leaves each, and one three leaves; the leaves of the latter are now curling, whilst the other four are perfect; all are seedlings and fine healthy plants; none have ever been in heat; some of the leaves are now 14 inches long and 4½ wide. They are well worth growing for the foliage alone. *An Old Sub., Halifax.*

Olaus Magnus and his Unknown Tree.—Is it not probable that this ought to be referred to the same class of fables as Messrs. Huc and Gabet's wonderful letter-tree? Unless evidence is to be found in corroboration of the account given by Olaus Magnus, it seems to me that inquiry will be time ill-bestowed. *Jad.*

Potato Disease.—We are sorry to announce that the Potato blight has reappeared and attacked the leaves and stalks with a malignancy almost indescribable, and that the usual stench emitted by them is now everywhere unmistakeable, and none have escaped but very early kinds. It is spreading like wildfire, and no doubt ere this communication appears in type it will have progressed considerably. How far it may prove fatal to the tubers remains to be known; but judging from experience in past years, their luxuriance in foliage renders them very susceptible to decay. The only preventive we know of is cutting off their tops and leaving them to chance, thus bleeding them, as it were, to death by degrees, and causing those yet uninfested to be more dry and mealy, and in better keeping condition than they would otherwise be. Pulling the stalks up is not so well, as it destroys their vitality, and thus shuts in disease, subjecting them to further decay. Be this as it may, all should be done that can be before the tubers become too far contaminated. *Hardy & Son, Maldon.* ——About a fortnight ago I plainly discovered some symptoms of disease in this neighbourhood, and I regret to inform you that its virulence has since made rapid progress. The crop which had previously promised so well, looking most luxuriant, will in all probability be most seriously injured. Yesterday I took a walk through the parish of Rumboldswyke near this city, and there could be no mistake about the extent of the disease, owing to the disagreeable smell emitted by the plants in all directions. I observed that in some grounds the haulm had been removed, and some persons are digging up the tubers for immediate sale. *W. W., Chichester.* [We are sorry to be obliged to confirm these statements; but it is to be hoped that the tubers are not, as yet, much injured, and that this hot, dry weather will stop the mischief. Even Flukes, with us, have their leaves affected!]

American Aloe.—Is it the true American Aloe that your correspondent "Anon." preserved last winter out of doors, without any protection? or the Yucca gloriosa, a plant often confounded with it? *Vectis Consistorial.*

Reproduction of Aphides.—I have read your notice of Dr. Mann's interesting little book upon the "Philosophy of Reproduction" with much pleasure. I wish, however, to make one or two remarks upon Dr. M.'s description of the development of the aphis, and I do this more to excite the attention of naturalists to the subject than to offer the result of any matured investi-

* Chief *Novelties* exhibited in the Marquee Museum.

gation. Dr. M. says that—"Through the early summer the colonies of the aphides are wingless; but later in the season individuals appear in their grazing flocks, who have magnificent wings stuck rigidly and proudly up from their backs. Now these winged aphides are like the winged ants, the males and females of the species." This, I am aware, is a description which is received by naturalists. It is the fact upon which that singular modification of Steenstrup's theory of alternation of generation is applied to the reproduction of the aphis. But it certainly is not exactly correct, and I should not be surprised if the theory were itself upset upon more extensive examination and closer observation. It is not true that the winged species appear only at the end of summer or in the last brood, a fact of which I have long been aware; but whether these insects are all winged females or not I am unable at present to say; but the following facts are interesting, and may stimulate some of your readers to a further examination of the subject. In the latter end of June of this year, just when the Thistle began to show its unwelcome head in our fields, I found several of these plants in my meadow, close to my garden wall, covered with the pitchy black aphis Cardui. They were the first aphides I had seen out of doors this year. I dug up several of the plants, plunged the roots into a glass containing water, and placed them in a room for observation. The great majority of the aphides were wingless, but some of them had wings. In a few days they had increased considerably in numbers, but the wingless insects developed wings in great numbers—so much so that they became the most numerous of the two. I saw several of the wingless insects in the act of parturition, but none of the winged. I saw no conjunction of the sexes, but I admitted the possibility of this, as my observations were confined to a short time each day. The winged insects, when fully developed, took wing, and covered the small window of the room. I saw them in all stages of their wing growth. Now, perhaps, these observations are not sufficient to reason upon, but they are quite enough to prove that the winged aphides are not the last brood. Their wings are clearly given for locomotion; if they are all females, and viviparous, they are the means by which the family is so quickly propagated from plant to plant; if they are male and female, which I confess is very probable, there is an end to the generally received opinion of their reproduction. I confess I should be glad if this were the case, as the bud within bud theory, although very wonderful, has no other positive analogy in animal nature. In Steenstrup's "Alternation of Generations," the intermediate condition of the animal is dissimilar either to the first or last. It is not in the least more wonderful than larva, chrysalis, and imago among insects, but according to the theory of the development of the aphis we have the sexual intercourse but once in eleven generations of an insect precisely similar in all its phases. I beg you will accept these remarks only for as much as they are worth. I am quite confident my aphis Cardui brood was the first of the season. I saw the wings developed from the wingless insect; and I saw the viviparous birth of many from the wingless female, while the winged variety were clustering about my window. *O. R. Bree, Stricklands, Stowmarket, Aug. 13.*

Societies.

Horticultural, *August* 14.—At a special general meeting held this day, the Right Hon. Lawrence Sulivan in the chair, William Wilson Saunders, Esq., was unanimously elected a new Member of Council and Treasurer, in the room of Dr. A. R. Jackson, deceased.

Royal Botanic, *Aug.* 10.—Anniversary. J. W. Freshfield, Esq., M.P., in the chair. The Duke of Norfolk, E.M.K.G., was re-elected president, and Ed. Marjoribanks, Esq., treasurer. The Earl of Aberdeen, K.G., the Earl of Mansfield, General Buckley, and Professor A. Henfrey were elected new members of the Council for the ensuing year. In their report the Council represented "the condition of the Society as one of uninterrupted prosperity," although from the pressure of the times the amount of the receipts had been "somewhat less than it was last year," and "anticipating a greater diminution than has actually occurred the Council has not undertaken any expensive works," but "the garden has been continued in a high state of culture, and the character of the exhibitions has been fully maintained." The number of tickets sold was 24,887. In the report of the auditors it appeared that the receipts, including 5652*l.* 3*s.* 6*d.* for exhibition tickets, were 8639*l.* 2*s.*, besides the balance left in hand last year of 3810*l.* 16*s.* 2*d.*, making a total of 12,449*l.* 18*s.* 2*d.* The payments were 9369*l.* 13*s.* 2*d.*, which includes 1175*l.* repayment of debentures, and leaves in hand a balance of 3080*l.* 5*s.*, considerably more than all the floating debts of the Society, which include 1601*l.* 5*s.*, the sum awarded to the successful exhibitors of plants and fruit. From the secretaries' and curator's reports we gather that the attendance of students from the colleges and artists had increased materially; that the lectures were well attended; that a large number of cut specimens had been furnished to professors and lecturers, and that upwards of 400 species had been added to the collection of herbaceous plants. Sir H. P. Willoughby, M.P., asked a question relating to the sale of Exchequer bills, which appeared in the statement of receipts, and being told that they were part of the balance in hand last year and not capital, he expressed his approval of the accounts, and moved that the reports be received and printed. Votes of thanks to the President, Council, and officers, and similar routine business concluded the meeting.

Notices of Books.

Thompson's Gardening Book of Annuals (Simpkin) will be useful to the inexperienced amateur, who desires to know what to select for his annual garden, and how to cultivate it. The directions are plain and useful, and the list of species as long as any reasonable person can desire; to which we may add, what is no small praise in these days of book manufacturing, that the descriptions are faithful, with no tinge of exaggeration. We need not say that of all branches of cultivation, that of annuals best suits the purpose of persons of moderate means, as it is among the greatest aids to the decoration of places where cost is the last subject of consideration. In this most especially they possess a merit of their own that by skilful combinations of even the commonest of them, effects are to be produced in the open ground which the rarest and costliest of novelties cannot surpass. A few old-fashioned hardy annuals, *well-grouped* and *well-grown*, in the hands of a man of taste, will give to the meanest plot of ground all the brilliancy of a regal parterre. This has been admirably shown, as we are informed, in the permanent horticultural exhibition now open in Paris, and we hope that the lesson will have been diligently studied by the visitors. The great point is *how* to group well and *how* to grow well. Upon the former subject Mr. Thompson does not touch—upon the latter he gives useful advice, as a specimen of which may be taken the following remarks upon *soil*, a terrible stumbling block with the inexperienced:—

"*Soil.*—Perhaps the soil best suited to a majority of the annuals, and we might add of plants in general, is a light friable loam, containing a moderate amount of vegetable matter, and sufficient sand to render it porous; but as it rarely happens that the amateur has much choice of soil, it is fortunate that most of them will succeed in any but such as is of an extremely dry, sandy, or calcareous nature, or of a stiff, heavy, retentive character. In the former the plants are sure to be starved, and in the latter, if they ever fairly take root, there is generally an undue development of the foliage at the expense of the flowers. In soils of this description much may be done by thoroughly breaking up the superficial crust; or, as it is technically termed 'trenching' it at least one spade deep, digging in sand, road-scrapings, or in the absence of anything better, coal-ashes, which usually contain a large proportion of silicious matter; and if the operation be performed in autumn, so that the loosened soil is thoroughly exposed during the winter to the disintegrating influences of frost, and other atmospheric agencies, the advantage will be greatly increased. In soil of an opposite character, *i. e.* sandy or calcareous, the remedy will obviously consist in the addition of loam in conjunction with decayed leaves, or very old rotten manure; or, where expense is no object, the surface soil may be entirely removed to a depth of 6 or 8 inches, and its place supplied with the best loamy compost at hand. In town gardens, where the staple is of a dry burning nature, these ameliorative measures will be especially necessary; for when, as is usually the case, these are of limited extent, and walled in, the heat in summer is so great, that a soil of richer and moister character than might be necessary in other localities is indispensable. With these exceptions, however, it is only in extreme cases that the measures suggested will be necessary; measures which, let it be observed, parenthetically, though alluded to in connection with annuals, are really applicable to the culture of most other ornamental plants, whether herbaceous perennials, bulbs, or shrubs, the only difference in their requirements being that a smaller depth of soil will suffice than would be desirable for most perennial plants. In ordinarily good soil, an annual dressing of leaf-mould, decayed turves, or thoroughly rotten manure, in quantities proportioned to the requirements of the soil, dug into the depth of a few inches, will be all that is requisite; these should be applied in spring, only just previous to sowing the seeds, or much of the benefit resulting from their application will be lost, though a simple digging may be advantageously given in autumn. The use of strong crude manures of an animal nature should be carefully avoided, though for those who have a turn for experiments, we may state that bonedust, and the superphosphate of lime may be safely employed, and with some advantage in poor soils, as well in the culture of annuals as of plants of a longer duration. The bonedust must be as fine as possible, or but little advantage will result from its use, on account of the longer time required for its decomposition when in a coarser state of division. It should be dug in with leaf-mould, or in the same way, either in the precise spot where the seeds are to be sown, or over the general extent of the border. The superphosphate of lime, being more soluble, will be best applied only after the seedlings have attained the height of an inch or two, and should be strewn, in small quantities, around and over the patches in moist weather. Saline manures, such as nitrate of soda and sulphate of ammonia, are also unobjectionable, and may be employed in the same way, though they are more generally applied in a state of solution, a teaspoonful of the salt being sufficient for a gallon of water. Many annuals, especially those of a robust habit, will bear an occasional dose of weak liquid manure, of which, however, mention will be made more appropriately under another head. It may be useful to know that a large number of the annuals succeed well in peat or heath mould, and may therefore be sown in the borders of peat-beds, or round groups of Rhododendrons, or similar shrubs; but there are very few for which it is really indispensable, and for these a light sandy loam with an admixture of leaf-dust often answers nearly as well."

Garden Memoranda.

Gunnersbury Park, the seat of Baron de Rothschild.—The trees on that portion of the Peach wall here which has been faced with glass, as described at p. 550 of our volume for 1853, have again this year borne most excellent crops of large and finely coloured fruit, which with the exception of that on a tree of the Téton de Vénus, is already nearly all gathered. The advantage of thus covering existing walls with glass is well exemplified in this case, in which the size, appearance, and flavour of the fruit, owing to the facilities provided for giving plenty of air, are quite as good as those of Peaches grown on the open wall, while the certainty of having a crop is secured, and where the consumption is not very great, fruit of excellent quality might be had until it can be obtained from out of doors. The piece of wall covered here is 124 feet in length, the glass protection being put up in the form of a narrow Peach-house, with short sliding sashes on the roof, an upright front about 6 feet high, the back wall being 10 feet in height, and the width of the house about 5 feet. The front sashes are swung by their middle on pivots and move outwards, and additional ventilation is afforded through openings furnished with horizontal wooden slides in the slate panelling between the short piers which support the frontage. The interior can be warmed when required by means of a flow and return 4-inch pipe, which is led along the front immediately opposite the little ventilators last spoken of. Thus the cold air admitted gets partially heated before it reaches the trees, and that at a time when the leaves are young and tender, and therefore least will bear a check. Two narrow shelves, one above the other, run along the whole length of the front, forming convenient places for Strawberries in pots, not only for forwarding them a little for forcing, but also for keeping them from wet late in autumn, too much of which, it is well known, greatly injures them. The Peach trees are, of course, confined to the back wall, which has been plastered with cement and furnished with a wire trellis for training them on. The trees are extremely healthy, without any signs of mildew or red spider, and they have made abundance of good bearing wood for next year.

The young Vines with which all the vineries have been planted have made excellent wood, and such as are two and three years old have borne some good bunches. Vines in pots are also grown here to some extent, and with great success, as the beautiful exhibition of them produced by Mr. Forsyth, at Chiswick, in June last, served to indicate. They are struck from eyes put in in spring, and the rest of their treatment differs little from that practised in other places; the great point aimed at is to get the wood thoroughly ripened, without which no good results need be expected, and to this end they are placed on shelves, and have their rods trained as close to the glass as possible.

Two new span-roofed houses, each 50 feet in length, with paths up the middle and beds on either side of them, have just been put up here by Messrs. Gray & Ormson for growing plants in, and already one of them contains a small collection of some of the better and showier kinds of Orchids, as well as other things requiring the temperature of a stove. Among them was Coleus Blumei in excellent condition, the variegation of the foliage being unusually rich and beautiful. When skilfully grown, and its colours well brought out, as they were in this instance, few plants remarkable for fine foliage are handsomer or better worth cultivating than this.

The flower garden is, as a matter of course at this season, well filled with flowering plants; but owing to the late rains, the beds generally scarcely looked so gay as they evidently have done. Tom Thumb and pink coloured Geraniums in the way of Lady Holmsdale, Calceolaria viscosissima and integrifolia, Lobelia lucida, the white variegated Alyssum, and things of that sort were, however, in good condition. Two beds of Agapanthus umbellatus were coming nicely into flower, and will, doubtless, be beautiful late in the season. These were not planted out, but plunged in pots so as to be easily moved and taken under cover again for the winter. Two rustic baskets elevated on short pedestals and filled with Fuchsias were particularly striking. The plants measured nearly 4 feet across, and were beautifully in bloom. The variety was Defiance, a robust growing sort, which displays its crimson flowers in large clusters, well out at the ends of the branches, and is therefore well adapted for this kind of decoration. Two beds, one of crimson and the other of common China Roses, were also very pretty. These varieties, we need scarcely say, bloom most profusely, and last long in beauty. On the east side of the lawn the bedding plants are placed in baskets, the raised handles of which, covered as they are with Convolvuluses, Ipomœas, Maurandyas, Lophospermums, and Eccremocarpus scaber, serve to create variety and improve the flat appearance which is sometimes complained of in beds of low growing plants. Stationed at

short intervals along the terrace in front of the house were marble vases filled with Tom Thumb Geraniums, literally masses of flower, and nothing could possibly be more ornamental than they are at the present time. They consist of large plants cut in in autumn and wintered dry; and thus they are kept year after year for the purpose, till they become too large for the vases, when they are thrown away, and are replaced by young plants. We also remarked some handsome standard Fuchsias of the Carolina variety, about 8 feet high; these are treated in the same way as the Geraniums, and flower admirably every year.

The ornamental ground has lately been considerably increased in extent by taking into it a portion of the park on the west side of the house, and it has likewise been further improved by opening up a thicket of plantation which lay between the mansion and the lake, and converting it into a snug little dell carpeted with Grass, interspersed with Araucarias and other Conifers, and ornamented with a rustic basin and fountain in the centre. The Coniferous and other trees about the place have also lately been greatly enriched by adding to their numbers fine specimens of different kinds from various parts of the country. Among these the more remarkable are a Cupressus macrocarpa 20 feet in height and 15 feet in diameter, and others of the same species nearly as high, but not so thick; an Araucaria imbricata upwards of 13 feet in height, Pinus Pinsapo, quite 7 feet high and 10 feet through at the base; Cryptomeria japonica, 14 feet high; a Chinese Arbor-vitæ equally large; Deodars, 25 feet in height; Pinus insignis, 15 feet in height; Taxodium sempervirens, not much shorter; and Douglas Firs, quite 16 feet in height. One of the last named trees, a gigantic one placed in the park, was moved there by means of one of Mr. Barron's machines from Elvaston. This cannot measure less than 45 feet in height; since it has been transplanted it has pushed a little, but its top appears to be dead. These trees, together with many others, were all placed where they are in October last, and appear to have taken well with their new situations. They were all carefully moved with good balls, which were tunnelled underneath till a low truck could be got under them, on which, if the distance was short, they were conveyed at once to where they were to be planted; but if long the truck was run up into a spring van by means of an inclined plane, and then they could be carried with safety for miles, which many of them were. After they were planted the chances of success would, however, have been greatly diminished had they not been syringed over head every night during the dry weather which we had in spring and early summer; this, as might be expected, very much resuscitated their exhausted energies, and gave them strength to stand the heat of the succeeding day. These trees may now all be considered safe, and in time will doubtless form worthy companions to the magnificent Cedar trees for which this place is justly celebrated.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—The necessary quantity for a season's supply of the various kinds of soils used in potting should be got in at once before the ground gets sodden with the autumn rains; for the mechanical texture of even turfy soils is much injured by their being carted and stacked up in the wet. Therefore the soil should be cut in a rather dry state, and put up neatly in narrow ridges, so as to protect it from wet, and expose it as much as possible to the action of the air. And as success in plant-growing depends largely upon having suitable soils for potting, no necessary trouble or expense should be spared to procure these when well-grown specimens are expected. Moderately good loam is not difficult to procure in most neighbourhoods, but anything like good peat is not to be had in every locality. This is absolutely necessary, however, for the successful culture of the great proportion of our most esteemed plants, and two kinds are desirable if not essential, viz, one of a light heathy nature for Ericas, Epacrises, and fine-rooted plants generally, and a stronger Grassy sort for stove plants, Azaleas, and many New Holland plants. And these should be procured in sufficient time to allow of having them in a mellow state when wanted for use, and if the owners of gardens understood their own interest in this, they would not scruple the little expense necessary to keep up a sufficient stock of soils in a fit state for use, for there is nothing more disheartening to a gardener, or a greater tax upon his time, than being without suitable soil in working order whenever it is wanted. Look over such things as Achimenes, Clerodendrons, and other stove plants liable to injury from damp, daily, and remove decaying flowers immediately they are perceived, as a few days' neglect in the present state of the weather may injure a handsome specimen. Any of the twiners which have done flowering may be slightly cut in, so as to prevent their straggling, and they should not be allowed to shade the house too much; and canvas shading must not be used too freely after this season, particularly if cloudy weather such as has prevailed of late continues.

Greenhouse.—Maintain a moist state of the atmosphere by frequently sprinkling the passages, &c., on bright days, and dew growing plants overhead with a fine-rosed syringe towards evening. Look carefully after mildew on Heaths, and apply sulphur the moment it is perceived, for if neglected but for a few days it will disfigure the finest specimen. Remove the flowers from plants in bloom directly they begin to fade, and cut back the shoots so as to secure close bushy growth, placing the plants in a cool shady situation, until they fairly start into growth, sprinkling the ground about them frequently on dry days, and dewing the plants overhead morning and evening. Plants that have fairly started into growth after being cut back, and require more pot-room, should be repotted at once, observing to have the balls in a healthy state as to moisture, &c., and supplying them very cautiously with water after repotting, until the roots get hold of the fresh soil. Do not allow young stock in free growth to suffer for the want of pot room; and attend to stopping any over luxuriant shoots, so as to secure a compact bushy habit of growth.

FORCING DEPARTMENT.

Pineries.—Those who intend commencing the culture of Pines on the Meudon or open bed system, cannot begin at a more favourable season than the present, as there is now little chance of our experiencing much hot dry weather to cause the plants to show fruit before the roots get hold of the fresh soil, as is sometimes the case to the great disappointment of the beginner and the undue discredit of the system. The bed should be from 18 inches to 2 feet deep, and should consist principally of good rich mellow turfy loam, well broken up, and carefully intermixed with a liberal sprinkling of clean sand, and a small proportion of leaf soil or good rich fibry peat; for when rough turfy soil is used and the bed is ever, from any cause, allowed to get thoroughly dry it is very difficult to moisten it again, as the water passes off through the lumps without penetrating them. But if the loam is well broken up and mixed with some leaf soil, or peat and sand, it will be found to take water freely enough, and the roots will be almost as much under command as when the plants are grown in pots. Persons commencing this method of growing Pines should also endeavour to avoid planting out pot-bound plants, for these, whether young or old, seldom strike root freely into the fresh soil, and are very apt to fruit prematurely; but if such plants must be turned out, then care should be used to make the soil firm about the balls, so as to prevent the water passing off without moistening the balls. For persons who grow Pines largely, and have several houses or separately heated compartments devoted to their culture, the open bed system has many advantages; but where something like a regular supply of fruit is expected to be furnished from a comparatively limited number of plants and accommodation, we would still prefer the pot system of culture. Vineries.—The season has been anything but particularly favourable to young Vines planted this spring, and every possible attention must be afforded these where strong well-ripened rods are expected. As the weather has been lately, there has been no necessity for watering the outside border; but as the roots will be mostly near the surface, this must be attended to in the event of our experiencing dry sunny weather, for unless a vigorous root action can be secured strong well-ripened wood will not be obtained. Give air freely and early on fine days, so as to avoid any risk of scorching the foliage, but shut up early in the afternoon, sprinkling the floors, &c., so as to cause a genial moisture in the atmosphere, which will be of great service in strengthen- the Vines. If plants are grown in the house, and with the rage for plant-growing which is almost universal at present this will doubtless be unavoidable in many instances, see that the plants are not infested with black thrips, and on no account be induced to regulate the temperature, &c., of the house for the plants, but remove these to other quarters, or make them succumb to the treatment most suitable for the Vines. Keep a sharp look out for the appearance of red spider in houses where the fruit is ripening, and coat the pipes or flues with sulphur on the first appearance of this enemy. Indeed it is well to do this occasionally by way of a preventive, which, in this case as in most others, is vastly preferable to a cure. Vines in pots intended for early forcing will require attention to get the wood properly ripened, and this should be effected by exposing them freely to light and air.

FLOWER GARDEN AND SHRUBBERIES.

The beauty of bedding-out plants is but of comparatively short duration in most localities even in the most favourable seasons, and now that they are in full flower every care should be exercised to render them as attractive as possible, keeping everything in the most perfect order that the means at command will allow. Go over the beds frequently, and remedy any defect that may be perceptible, such as pegging down any plants that incline to grow too high for the others, and keep the edges of the masses well filled up without allowing them to become too bulky. Where the plants are growing very rapidly this will involve some considerable trouble in the way of stopping the shoots, &c., but this must be attended to sufficiently often to keep the plants within due limits, for nothing looks worse than to see them running over the edging, or encroaching upon the Grass, and nothing of this kind must be allowed where anything like high keeping is aimed at. Attend to plants in vases, and do not let these suffer for the want of water at the root, and some things in this way will be benefited by an occasional supply of manure water in a weak state. Take advantage of every leisure hour to put in cuttings, and use every possible dispatch with this work until the full stock is got in. Look over Hollyhocks occasionally, and secure any cuttings that can be obtained from varieties which it is desirable to increase. Cuttings of these rooted in autumn make fine strong flowering plants for the following season, and occupy less room in winter than the old plants, but the cuttings must not be put into heat at once, as strong sappy cuttings, such as are obtained from plants growing in the open ground, are very apt to damp off in heat. Give the plants a liberal supply of manure water in the event of the weather being dry, and Dahlias on light poor soils will well repay similar attention.

HARDY FRUIT AND KITCHEN GARDEN.

The long continued wet, cloudy weather which we have experienced, has induced very rapid growth in fruit trees generally, and except such as are well loaded with fruit, they appear in most instances to have already made as much young wood as there is much chance of getting matured in course of the autumn. Where this is the case, it will be advisable to go over the trees at once and stop a portion of the shoots, beginning of course with the strongest. This will be found to serve the end in view much more effectually than a general stopping at this season, which would probably be of no farther service than inducing the production of a mass of laterals, and do more harm than good, whereas, stopping the stronger shoots will only throw the sap into the weaker ones, and if we should be favoured with a fine autumn the buds and the shoots stopped will become plump without starting into growth, and in any case there will be fewer laterals produced by stopping only a portion of the shoots than there would be if the shoots were stopped generally.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,

Notices to Correspondents.

Bees: A question asked in our last paper about "stupifying bees with nitre," may be perhaps satisfied by the following advice:—If our correspondents will use chloroform they will find it perfect in its action and preferable to the fungus. The way to proceed is to put two teaspoonfuls of chloroform into a cup, to soak a bit of rag in it, and to put the rag into the hive, of course closing the entrance; the bees will almost immediately begin to drop, and in less than 10 minutes every bee will be stupified. They will come to themselves in about half an hour.

Books: *G. Stevens.* The new edition of the "Theory of Horticulture" costs a guinea. We now adopt the plan of always adding to our notices of books their price when we know it. But it continually happens that the price is not stated in none of the volumes, and then we have no ready means of knowing. *J Shearn.* Get "Lindley's School Botany;" to be had of all booksellers.—*Syringa.* Brown's "Forester."—*D. J.* There is much difference of opinion in regard to bee-books: but we have always heard Bevan "On the Honey-bee" well spoken of.

Cherry Stones, &c.: *C B.* Keep them in dry sand all winter and sow them in the spring.‡

Gooseberries: *J M.* Your seedling has the merit of being one of the large kinds; but we find no improvement in quality.

Justicia Leaf: *H R M.* Can you furnish us with another specimen?

Lime: *A Sub.* You will not find either this or chalk of much use in the absence of clay. The Cryptomeria and Hemlock Spruce will do better in the sandy land without chalk. Sand suits coniferous plants generally. American plants do not like chalk. Your lime rubbish from old buildings, mixed with clay and sand, will be a good soil for most things. Even sand will grow many plants well, provided it is both damp and well open at bottom; and you can give it frequent dressings of decayed vegetable matter, such as rotted vegetables, weeds, leaves, sticks, straws, and the like.

Names of Plants: We have been so often obliged to refuse to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never said or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is only requested that, in future, not more than four plants may be sent us at one time.—*H D.* Lolium temulentum.—*J W.* Euphorbia cannabinum.—*P. Ealing.* Clitoria ternatea and Lonicera sylvatica longifolius.—*G S.* Spiræa ariæfolia.—*A Constant Reader.* A fragment of Aira cæspitosa.

Paper Materials: *Colo.* Number 1 is bad, two is pretty good if it will bleach. Plenty of such materials are to be found; the great question is the price at which they can be supplied, and how far they will bleach well.

Strawberry: *J A P.* Your fruit had been bruised to pieces before it reached us.‡

Misc: *Berks Gardener.* It is doubtful if liquid manure would be of use to American plants. If you employ it it should be on a small scale first by way of experiment. April is the best time to thin Laurels and other evergreens. Your Wistaria may be led along near the ground in the manner you propose without injuring it.‡

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 5l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 4l.

Offices, 49, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda. Sulphate of Ammonia, and other Chemical Manures.

CORN MANURE FOR SPRING SOWING.
CONCENTRATED URATE FOR GRASS, RAPE, AND ALL ROOT CROPS.
SUPERPHOSPHATE OF LIME.

THE LONDON MANURE COMPANY continue to manufacture the above Manures, which have been used with so much success for the last 14 years.

The London Manure Company also supply PERUVIAN GUANO (direct from importers' warehouses), Nitrate of Soda, Sulphate of Ammonia, Fishery and other Salts, Bone Dust, and every artificial manure of known value. EDWARD PURSER, Sec.
Office—40, Bridge Street, Blackfriars.

MANURES.—The following Manures are manufactured by HODGSON & SIMPSON, Calder Soap Works, Wakefield, and MATTHEWS & Co., Manufacturing Agricultural Chemists, Driffield. SIMPSON'S AMMONIA PHOSPHATE, a valuable Top-Dressing for Wheat, Barley, and Oats. SIMPSON'S NITRO PHOSPHATE for Turnips, Potatoes, and all other fallow root crops, price 8l. per ton. N.B. Manures specially prepared for Grass and Flax. The above have been successfully tested for the last Seven Years by the leading farmers in Yorkshire and Lincolnshire, and other counties, and were applied last season to a breadth of upwards of 15,000 acres of land with the most beneficial results to the crops. A List of Testimonials and other particulars will be forwarded by post on application.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5s. per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stony land in the most careful and complete manner, with 1½ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4l. per acre and under, and he can give reference to his employers in that and in other instances.
Watford, Herts, Aug. 18.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.
Offices, 52, Parliament Street, London.
DIRECTORS.
HENRY KER SEYMER, Esq., M.P., *Chairman.*
SIR JOHN V. SHELLEY, Bart., M.P., *Deputy-Chairman.*

George Thomas Clark, Esq.	William Fisher Hobbs, Esq.
John C. Cobbold, Esq., M.P.	Edward J. Hutchins, Esq., M.P.
Sir William Cubitt, F.R.S.	Sir S. M. Peto, Bart.
Henry Currie, Esq.	William Tite, Esq., F.R.S.
Thomas Edward Dicey, Esq.	William Wilshere, Esq.

Empowered to execute Drainage, Road-making, and other Land Improvements, and to Erect Farm Buildings upon Estates under Settlement, Mortgage, or otherwise; or Church property, and without investigation of Title to charge the whole outlay and expenses upon the Estate, to be repaid by instalments spread over any period determined by Landowners within the limits of 50 years for Drainage and Roads, and 31 years for Farm Buildings.

Landowners may arrange with the Company for the execution of the works by their own agents, with the use of their own or the Company's Capital. WILLIAM CLIFFORD, Sec.

THE LANDS IMPROVEMENT COMPANY.—Incorporated by Act of Parliament, 1852—53, for England and Scotland, and further empowered by Amendment Act, 1854—55. To Landowners, the Clergy, Solicitors, Estate Agents, Surveyors, &c., Tenants for Life, Trustees, Owners in Fee, Incumbents of Livings, Bodies Corporate; Lessees for Lives renewable, or for a term of more than 25 years; (and Lessees for Lives not renewable, or for a term less than 25 years, with consent of their Lessor), &c., are enabled, by way of Loan from the Company, or by their own funds, to execute and charge on the Lands improved, by way of rent-charge for a term of 25 years, repaying capital and interest, the cost of every landed improvement, especially of Drainage, Irrigation, Warping, Embanking from the Sea, from Lakes, Rivers, or Streams, Inclosing Any Land, or improving Drains, Streams, or Water-courses, Reclamation, Farm Roads, Clearing, Erection of Farm-houses and other Buildings required for farm purposes, and the Improvement of and Additions to Farm Houses, and other Buildings for Farm purposes already erected: Planting for Shelter and for Periodical Cuttings, Jetties or Landing Places on the Sea Coast or on the banks of navigable Rivers or Lakes in the Highlands and Islands of Scotland: Engines and Machinery for Drainage, Engine-houses for Farm Steadings, &c., Water-wheels, Tanks, Pipes, Water-courses, Bridges, Sluices, &c. The Plans of Buildings, Specifications and estimates are prepared by the Applicant's own Agents and are submitted to the approval of the Inclosure Commissioners' Inspectors who are also the sole judges of the due execution of the works. Proprietors may apply jointly for the execution of Improvements mutually beneficial,—such as a common Outfall—Roads through the District—Water power, &c. The Directors wish it to be understood that the Company is of a strictly commercial character, and that the details of the Plans and of the execution of the Works are not interfered with by them, but are controlled by the Landowner and by the Inclosure Commissioners. For further information and for Forms of Application, apply to the Honourable WILLIAM NAPIER, Managing Director, 2, Old Palace Yard, Westminster.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

THE BEST PROTECTOR FROM THE HEAT OF THE SUN. "FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of EZEKIA THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the Kingdom. "It is much cheaper than mats as a covering."

CAUTION.
PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened so frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to horn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

WOOD STACK PEGS ENTIRELY SUPERSEDED BY FULLARD'S PATENT IRON SCREW THATCH PINS.—Great advantage is secured against having Corn and Hay Stacks unroofed, as is often the case in strong gales, by using the Patent Iron Screw Thatch Pins. They will wear many years, are easily and firmly inserted in all kinds of stacks, and a much less number than of the common wood pegs will suffice. They will be found extremely serviceable to the corners and sides of stacks that are much exposed to wind.

Orders speedily attended to; and may be had at 3s. 6d. per dozen, of the Inventor and Patentee, Mr. GEORGE FULLARD, Thorney, near Peterborough.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the nobility, gentry, and clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, together with a copy of the testimonials, will be sent on application to WALTER CARSON & SON, 9, Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be sent direct.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE QUEEN'S UNIVERSITY IN IRELAND.
QUEEN'S COLLEGE, BELFAST.—DEPARTMENT OF AGRICULTURE.

The Matriculation Examination for the Session 1855-56 will be held on FRIDAY, October 19th, and the Lectures will commence on November 1st.

Four Scholarships of the value of 15l. each are awarded by Annual Examination. Scholars are also exempted from one-half of the Class Fees. The College Fee is now reduced to 5s.

For the Times and Subjects of the Examinations, the amount of the Class Fees and the method of proceeding for the Diploma of Agriculture in the Queen's University, see "Belfast Queen's College Calendar for 1855." By Order of the President,
August 18. RICHARD OULTON, Registrar.

ANERLEY POULTRY SHOW, AUGUST 28, 29, and 30, will open 1000 Pens of the finest POULTRY AND PIGEONS in the World, including many new varieties.

Admission on the first day, TUESDAY, at 2 P.M., 2s. 6d. each; and on WEDNESDAY and THURSDAY, at 9 A.M., 1s. each. The Band of the Royal Artillery will attend each day. Crystal Palace Railway Tickets are available from Anerley Station.

The Agricultural Gazette.

SATURDAY, AUGUST 18, 1855.

IN order to the correct reading of the crop reports in the following pages it must be borne in mind that most of them were dated nearly a week ago, and that since then the country has enjoyed the very finest weather for the harvest that could be. The testimony of our correspondents bears out the assertion made a week or two ago in these columns, that the present crop of grain is more laid than any that has been reaped for years in this country. Probably notwithstanding all the excitement attending the trial of reaping machines at Carlisle, and that of the renewed competition to be witnessed during the week after next at Abbots Leigh, near Bristol, there has not been for several years a harvest so little fitted for cutting by machinery as the present is. And many of the purchasers of these implements will be disappointed by their lying useless, while hand-labour, at more than ordinary expense, is doing the work which they have proved unable to accomplish. The very hazardous condition in which most of the corn crop lay a week ago is well described by a Yorkshire correspondent as follows:—

"Besides filling up the enclosed tabular account of the appearance of crops, I think it well to give you some account of the weather, &c., since I wrote to you on the 4th inst. The 4th was a much finer day than we had had for some time. Sunday 5th, a little rain, but not heavy. Monday 6th, a steady soaking rain of 16 or 17 hours' duration. Tuesday, showers and dull day. Wednesday 8th, very heavy rain of 10 hours' duration, which lodged corn more and worse than all the previous rains. Thursday dull but fair. Friday a splendid sunny day. Saturday 11th, very close and hot without sun up to this time, 12 A.M. The Wheats are very much lodged, far more so than usual, a dark rusty colour, and I fear cannot be otherwise than damaged; of course much will depend on the weather to follow."

This condition of things, which was general, will account for a somewhat gloomier account of our harvest prospects than would be generally given now. Our report, corrected for the week of fine weather which we have since enjoyed, may, therefore, probably be read as follows:—Wheat not more than average, taking into account the inferior quality of the sample. Barley abundant, but coarse, and injured for malting purposes. Oats below average in Scotland, above average in Ireland, not more than average in England. Hay one of the worst crops ever known. Green crops generally good, but foul. Harvest from a week to a fortnight later than usual.

A word must be added on the Potato crop. Notwithstanding the generally encouraging tone in which this crop is referred to, especially in the north of England and Scotland, it will, we believe, be found that, during the past week in Ireland and in Southern and Midland England, a very rapid disease and destruction of the haulm has been going on—more rapid, according to our accounts, than has been known for several years. Whether this may be followed by the rotting of the tubers remains to be seen. All through the south of Ireland the crop has this leaf disease, and many of our correspondents in England as well as Ireland, who had been unanimous as to the splendid promise of the crop, have since written to say that the disease has spread rapidly since their original report was posted.

IT is important for the public to know how far the question of STEAM CULTURE has been advanced by the trials at Carlisle. The 200*l.* premium still invites competition, because no machine actually ploughed or dug there a certain area of ground in a workmanlike manner, and at an ascertained cost below that of ordinary farm labour. The judges would not be justified in awarding the prize for any less useful and economical invention.

Nevertheless, three steam cultivators, contrived on perfectly distinct principles, were exhibited, and to all thoughtful observers appeared at full pressure with information—"blowing-off" instruction, and flinging out rapid lessons at every revolution of their wheels.

Leaving the question of the form of tool, which is of secondary importance, let us try to show what the Carlisle Meeting has taught concerning the main difficulty, viz., *the mode of applying the power to the implement.*

In field tillage a steam-engine of necessity acts under great disadvantage. As the material to be manipulated (namely, the stratum of soil forming the cultivated staple), cannot be "fed" to the machine, the machine must be moved over every part of the wide-spread material. This involves a dilemma in applying the power. Either the motive power must travel with the implement, or be stationary and transmit its motion from a distance. In the former case it has the disadvantage of conveying its own great weight over a most difficult and opposing surface, involving loss of power; in the other case, the motor has the disadvantage of being at a distance (and an ever-varying distance) from its work; and must actuate the implement by means of connecting apparatus—involving likewise loss of power. But at last we have been rescued from the horns of this perplexity; and no longer impaled upon both, rest on one that has been rendered innocuous and secure. *The objections against*

a stationary engine have been completely overcome; so that the locomotive principle need not any longer deter us with its difficulties.

It was demonstrated at Carlisle that a locomotive steam-engine is unfitted for tilling *by traction.* BOYDELL'S *megatherium* strode with apparently marvellous ease over any inequalities of ground; but out of his 14 horse-power, *not half* was available for tilling the soil; the greater portion being absorbed in the mere propulsion of the engine. This mode of steam culture is, therefore, far too expensive; without mentioning the wear and liability to breakage inseparable from such usage of a ponderous machine. The principle of a locomotive engine actuating *a revolving digger* appeared to little more advantage.

USHER'S steam-plough economises power to a much greater extent than BOYDELL'S, being constructed, indeed, on a principle which involves a paradox. It propels itself forward over the ground, which must require the force of six or eight horses; and at the same time exerts its *whole* power in ploughing or tilling the land. This is accomplished by the cutting-shares being made to pass through the soil in an opposite direction to that in which the engine moves—their re-action thus tending to urge it forward. The power of the engine is 19-horse; and in spite of the utmost reductions and alterations from the original machine, the total weight is still very great. It is unfortunate that the non-appearance of this invention in the trial-field, and its downcast look just outside the showyard, gave the public a universal impression of its uselessness; yet soberer critics came to the conclusion that so heavy a mass of machinery could never answer in the long run, even had it made an admirable performance at first. Engineers generally agreed that it would knock itself to pieces in too short a period to be profitable. When the disappointed public in the trial field first heard how USHER was "foundered by the way," a witty wight suggested that BOYDELL should fetch him up; and, indeed, we are of opinion that the "endless railway" might be adapted to USHER'S engine with considerable advantage. At present, however, we see little hope of locomotive steam-engines being made by any contrivance to operate with economy upon the soil. All practical men know the excessive wear and tear of ordinary portable as compared with fixed engines; though this is occasioned by their travelling only to and from their place of work. An engine always travelling—not empty but working at the same time, must be in much more unfavourable circumstances; and having continually to traverse the uneven surface of arable land, must be greatly more liable to every species of derangement.

As far, then, as invention has yet progressed, we possess no effectual means of tilling the soil by the locomotive principle; for traction implements it is impracticable; for rotary tillers both cumbrous and costly.

On the other hand, the principle of actuating a travelling implement by a stationary engine has been proved to be sufficient for all the purposes of steam-culture; and in another article we hope to show how FISKEN'S steam plough demonstrates this truth.

In the meantime, it may be said "BOYDELL'S and USHER'S schemes may be improved upon." They may; but we believe that an extreme lightness of engine obtained by increasing the pressure of steam and the heat of the fire, or by employing mechanism of great delicacy, will tend only to augment danger and multiply the risk of derangement. Besides, logic applies the same apology to FISKEN'S method; improvements being just as likely to be made upon his principle as upon theirs; and the best horse now is ever the most probable sire of a best future progeny. *I. A. C.*

APPEARANCE OF THE CROPS.

THE FOLLOWING ARE ANSWERS TO A CIRCULAR DATED AUGUST 11.

COUNTY.	WHEAT.	BARLEY	OATS.	BEANS.	PEAS.	GREEN CROPS	POTATOES.	HARVEST TIME.	NAME AND ADDRESS.

THE SHOW OF HORSES AT CARLOW.

A stranger on first landing in Ireland is struck with surprise at the number of plain under-sized inferior horses, which are to be seen in the cars and other vehicles in the public streets, and he looks in vain for the massive forms of the English cart-horse. The Agricultural Improvement Society of Ireland, impressed with the importance of improving the breeds of agricultural horses, devote no less than six prizes to the purpose at the late Carlow show, scarcely inferior in amount to those offered by the Royal Agricultural Society of England :—

Section I.—For the best stallion of any breed for agricultural purposes, foaled on or after the 1st of January, 1848, and previous to the 1st of January, 1853. In this class there were 16 entries, and there ought to have been more, considering that two prizes were 30*l.* and 10*l.* Of these about one-half were of the Clydesdale breed, and although we should certainly like to have seen some specimens of the other English cart breeds, and particularly of the Suffolk Punch, yet we must confess that there is no description of horse better calculated either to breed a distinct breed or to improve the native breeds for purposes of draught than the Clydesdale; no other will assimilate so well with lighter mares, or less frequently produce those anomalous specimens which are so frequently the offspring of violent crosses. The Clydesdale is naturally an active animal, and therefore will improve without spoiling small and active breeds. It must not, however, be inferred that every Clydesdale is adapted for this purpose, or even that the majority of those either kept at home or sent out of their native shire are so suited. We must have none of the flat-sided, long-backed, long-legged animals that are often sold for high prices on account of the name, but a short-legged, compact, strong, and active animal, which good judgment can select and money can purchase. If such an animal is a Clydesdale so much the better. It was just such an animal that obtained not only the first prize but the medal, as being the best horse in any class. The owner was a Scotch farmer settled in Ireland, Mr. Selvester Rait, and who appears to have been a prize winner also in other classes. The horse was active, strong, and compact; not too large, dark brown in colour, and with much symmetry. The second prize was also taken by a Clydesdale belonging to Mr. John Pearson Bewley, a nice symmetrical animal, whilst a very superior brown horse of the same breed, No. 145, was highly commended, and would, no doubt, have received a prize if one or two exceptions had been passed over. No. 150, another Clydesdale, was commended. Several horses in this class were too light, and some too leggy.

Section II.—Of 2-year-old cart stallions there were ten entries, the first prize being awarded to Mr. S. Rait for a very superior brown Clydesdale colt, that bids fair to rival the winner in the first class. The second prize was given to No. 168, a fine young horse, but rather adapted for carriage than cart work, although quite as heavy (or more so) as the generality of farm horses in Ireland; the owner, Captain M'C. Bunbury, R.N. Some animals in this class were faulty and inferior.

Section III.—Draft mares in foal, or with foal at foot, or having reared a foal in the year 1855. The first prize of 10*l.* was taken by Mr. Rait, for a Clydesdale mare in foal, a very fine mare, and well calculated for breeding superior animals. A chesnut mare with a fine foal by her side was highly commended. The mare was a strong, useful, and active mare, but rather coarse, and with too much white about her legs. No. 176, a very compact, strong, and symmetrical grey mare, with a very pretty foal, belonging to Mr. James Hobson, was commended; as well as a fine old grey mare, No. 175, belonging to Mr. Thomas Butler. There were also several other useful mares in this class.

The prizes were withheld from Section IV., 3-year-old fillies, on the ground of want of sufficient merit. There were only four shown, and with the exception of one rather fine filly, No. 187, which was unrewarded for particular reasons, the animals were inferior. We doubt the propriety of offering a prize to this class at all: we think the money can be much better bestowed.

Section V.—The 2-year-old class afforded more promise certainly. There were 9 entries, and the prize was awarded to No. 194, a Clydesdale filly, belonging to Mr. James Kerr; whilst the second prize was taken by a promising Cleveland filly, belonging to Mr. James Waldie. No. 193, a very strong and compact black filly, belonging to Mr. James Cannon, was highly commended. No. 196, a Clydesdale cart filly, belonging to Mr. Peter B. Mosse, was commended; as well as 197, the property of Mr. E. B. Swift. It is interesting to note that No. 196, as well as the prize winner 194 were got by the prize horse (Glancer) in the first section.

Section VI.—For draft fillies foaled in 1854. The prize was given to No. 200, a draft filly belonging to Mr. James Kavanagh; and the second to No 202, belonging to Mr. John Ronaldson, both Clydesdales. No. 205 was commended. In conclusion the writer would beg to make the following suggestions: 1st, the horses and mares should be shown in roomy boxes instead of narrow stalls, so that every countryman should be able to carry away with him in his mind a correct outline of the best form of animal to propagate or to purchase. 2d. We would recommend that prizes should be given to the best stallion and mare calculated for breeding horses for the cavalry. Ireland with its extensive pastures and with its native breed of horses, now we fear degenerated but susceptible of so much improvement, is peculiarly adapted for this purpose. It is unnecessary to describe further the sort of animal required, as it is evident that he must be of a good height, strong, safe, and active, and with a fair amount of breeding. Such an animal would always command a market, not only in the army, but for numerous other purposes, and would also be available, until sold, for all the farmer's requirements.

If the funds of the Society are not sufficient, we think for such a purpose the sections for 3-year-old and yearling fillies may be dispensed with; indeed, we can see no good reason why double the number of prizes should be given, as at present, to mares and fillies over that of horses. *H. C. S.*

THE PRIZE LIST AT CARLISLE.

It certainly appears extraordinary that Scottish farmers, not usually deficient in enterprise, nor unmindful of their own interest, should neglect the favourable opportunity offered by the meeting of the Royal Agricultural Society at Carlisle of bringing their valuable local breeds—and especially Galloways and Ayrshires, of which the Scottish border counties are the head quarters—under the notice of English and foreign buyers, and of probably originating an extensive and important English and export trade in these breeds.

I believe the explanation may be found in the offence which I *know* has been taken by breeders in Dumfriesshire, and I believe in Galloway and Ayrshire also, at the Royal Agricultural Society, for adhering to their usual schedule of prizes for short-horns, Herefords, and Devons only, in a district where a Hereford or Devon is quite as great a rarity as an elephant or a rhinoceros. True, the show of these breeds at Carlisle was excellent, and thousands had an opportunity of becoming acquainted with their merits who had never before seen a single specimen of either: but, like "the fine old English gentleman all of the olden time,"

"Who while he feasted all the great,
He ne'er forgot the small,"

the Royal Agricultural Society of England, whilst supporting the great breeds of the country, should adapt her schedule of prizes to the district in which the meeting may take place, encouraging also those breeds which long experience has proved to be suitable to it, and not leaving them to the accident of local or special prizes. The attendance at Carlisle is an evidence of the warm interest which the northern farmers take in the success of the Society, and of their appreciation of he great benefits which she has conferred on agriculture.

In conclusion, I venture to suggest to the two great national Societies whether it would not conduce to the advantage of the farming interest on both sides of the border to combine once in ten years to have a great national show, alternately in England and Scotland. Their combined resources, aided, no doubt, by contributions from numerous local societies, and supported by the railway interest throughout the country, would produce a show surpassing all precedent. *A Northern.*

Home Correspondence.

Turner's Corn Mill.—In your notices of implements at the Carlisle Meeting you conclude your remarks upon our patent combined crushing and grinding mill with the observation—"The mill was too complicated, we thought." Being a new implement we are anxious to correct, by a little explanation, the impression its appearance has thus created. We have found by repeated experiments that there is a decided advantage obtained by first crushing the corn intended for grinding; but there is obvious inconvenience in passing the corn through an independent crushing mill, and then conveying it to the stones. To secure the advantages only, we have in our combined mill simply placed a pair of crushing rollers over a small pair of stones. No machine can be more simple than our ordinary crushing mill, and the stones in the grinding mill drive in the usual way by placing the one over the other, so that the corn as it falls from the rolls passes directly into the eye of the stones (motion to the rolls being obtained by a single strap from the horizontal spindle of the grinding mill). There can be, in reality, no complication—particularly as the independent action of either mill is preserved, the rolls admitting of being used for crushing Oats, malt, or Linseed, &c., whilst the stones are still, and the stones also without the action of the rolls, perfect facility being also secured for getting at the stones without interfering with the rolls beyond removing the frame in which they work, which is effected in two minutes, and replaced as quickly. Setting aside the advantages we claim from the combined processes, its adaptability as a crushing as well as grinding mill will, we anticipate, prove it to be really valuable. *E. R. & F. Turner, Ipswich.*

Autumn Digging of Potatoes.—The tubers of Potatoes have attained the ripened condition in the month of October over the greater part of the United Kingdom. There is less difference caused with the ripeness of Potatoes by early and late climates, or southern and northern situations in Britain, than in the case of grain crops, which are more susceptible of external impressions, and are more regulated by climatic affections. Potatoes contain a very large assemblage of field and garden varieties which exhibit an earliness or lateness in being ripened, and are used accordingly. The sorts that are grown in the fields of the farm are found in two large divisions, kidney shapes and round eyes, which are in many colours, derived and continued from accidental circumstances. The kidneys are the earlier in maturity, but the least prolific; the stems are weaker, and sooner decay. The round shapes are most abundant in produce, and strong in the stems; later in ripening than the kidneys, but not so distant as that one time of digging does not answer for both varieties. The stems are generally green, at least in the tops, when the kidneys are wholly decayed, and a half-way decay of the stems usually marks the time of raising the crops of roots. Two particular methods are adopted in digging from the ground the tubers of Potatoes on farms that produce a very considerable quantity of the vegetable. One way appoints a man to dig each drill of Potatoes with a spade or fork, which throws off its load of earth and Potatoes, the latter being gathered into a basket by a lad or woman, who is appointed to each digger. The stems are pulled by the hand of the gatherer from the raising by the spade, shaken from the soil and tubers, and thrown into heaps, then into carts, and carried from the field. The tubers are placed from the baskets into carts that are conveniently set down on the field, and conveyed to the place of winter accommodation. The field is now cleared of roots and tops, is harrowed in order to find any stray tubers, ploughed, and sown with Wheat, or lies over winter for spring Barley. The other method sends forward one-horse carts that are followed by a gang of workers, who pull the stems of the Potatoes, one to a drill, shake off the adhering earth and tubers, and throw them into the carts, which convey them away. Carts follow behind and receive the tubers from gatherers with baskets, which precede the carts to prevent the damage from wheels bruising the Potatoes lying abroad. The stems and tubers being thus removed, the common plough drawn by two horses having the coulter removed, lays over the drill of Potatoes by passing along the side or half way from the top of the ridglet to the bottom of the furrow. The tubers are thrown up and exposed to view, gathered into baskets, thrown into carts, and conveyed from the field. The harrows drag into view any stray tubers, level the inequalities, and the land is treated as before. The intervals between the drills of Potatoes having been wrought during summer by scufflers and horse hoed, the latter with duck feet, and the drills having been earthed up after all the operations of hoeing by a double mould-board plough with a long sole and cast-iron plate, the bottom will be hardened by the sledging action, in many cases refusing admission to the water that falls, and which runs to the end of the drills. When the Potatoes are raised from the ground by the plough this firm bottom of the intervals is not moved; the plough is directed along the ridglet and underneath the tubers with one furrow, which covers the loose soil; the intervals of the drills and the bottoms remain wholly untouched. In the case of the land being sown with autumn Wheat, it may be expected that the seed furrow will reach below this firm bottom, and raise the hardened soil into action; or it may slip over it, and leave the consolidation to exclude any percolation of air or moisture. When sown with spring Barley, the bottoms remain wholly unmoved; and though less objectionable on these light soils than on the heavy earths that are the proper lands for Potatoes, yet the benefit will be large that there be an open transmission of air and moisture through the greatest possible depth of ground. This object is most evidently not attained by the use of the plough in raising a crop of Potatoes from the ground. The following method is suggested in order to remove the objection of the land being made firm by the sledging action of the plough, remaining in that condition, and denying a passage to atmospheric elements. A man provided with the common three-pronged fork of the farm is appointed to each drill of Potatoes along with a woman or lad with a basket. The man digs the fork sideways into the ridge of tubers below one stem, which is held (if any) by the hand of the latter, pulled to assist the fork, and shaken by the hand from the attached roots and adhering earth, and thrown into heaps to be carted from the field. The tubers are gathered into baskets, which are emptied into carts on the field, and drawn to the stone pits. It is the most especial duty of the overseer of the gang of workers to attend that the consolidated bottoms of the intervals of the drills are dug by the fork in the depth of the length of prongs, and the earth laid in a level surface of trenched ground along with the loose dry soil that has formed the drill and contained the tubers. Along with the stems and roots there may be gathered and removed any weeds that may remain in the land from the fallowing during summer, and stones, also, if the time of sowing permits. A pronged fork is preferable to the spade for this purpose, as the wide blade of the latter tool cuts into slices the tubers as it is thrust into the ground, and the resistance of its use is greater to the workman. The three prongs of the fork pass easily into the earth, and with less damage in cutting the roots, the pointed ends penetrate the subsoil and leave holes in the bottom into which air and moisture can enter. The earth is loosely raised and thrown aside, and the mould ground and the pierced subsoil are alike made porous. It is an essential condition that the entire ground is dug and raised by the fork—the top of the drills in one spit which throws out the tubers—another moves the side of the ridglet, and a third may be necessary to dig the bottoms of the intervals; all the spits must be close to the depth of the prongs, and narrow in width, not to break the tool in raising a heavy weight. *J. D.*

Tillering of Corn.—Interrogations are frequently put to us, will Barley and Oats tiller or branch as much as Wheat by being planted early, and singly, and thinly? Our answer is, that the former will, and the latter, we believe, will not. Oats however are decidedly the most prolific, containing many more grains in each ear than either Wheat or Barley, and require to be planted or sown equally as thin. Every perfect grain of Oats, sown at equal distances, with only half a peck per acre (not 3 bushels) by proper cultivation, and one essential point of this is to keep it clean, will not fail to produce five ears; this we believe cannot be denied, and each ear will be found to average 200 kernels or 1000 fold, equal of course to 1000 half pecks, or 125 bushels, or 15 qrs. 5 bushels per acre. Every grain of Barley too, planted at the rate of half a peck per acre in equal distributions, by superior culture, will not fail to produce 20 ordinary full ears, containing in each 30 grains, or 600 fold, and as a necessary consequence, equal to 600 half pecks, or 75 bushels, or 9 qrs. 3 bushels per acre. The Peruvian variety of Barley contains double an amount of grains in each ear than the common, and although smaller in size, it follows that this kind is much more productive and lucrative of the two, especially as it far exceeds all others in point of weight and nutriment. It is also earlier, but it is to be regretted that destructive birds will attack it in no small degree, as they do all early ripened corn. *Hardy & Son, Seedgrowers, &c., Maldon, Essex, July 26.*

Predatory Birds.—Parliamentary statistical reports for 1854 have been published, and it appears that the following numbers of acres under tillage for corn in England and Wales (to say nothing of Ireland and Scotland) was — Wheat, 3,807,846 acres; Barley, 2,667,776; Oats, 1,302,782; Rye, 73,731, making a grand total of 7,852,135, say 8,000,000 acres, by including all kinds of seeds. It thus follows that at this moderate estimation of 1 peck per acre only (and how often is there much more, nay even one-half of entire crops consumed, or spoiled on small plots, and in

cottager's gardeners) 2,000,000 bushels are actually destroyed by birds, &c., every year in these two countries! No mean consideration is this surely, in a time of scarcity, coupled with other sad wastes of corn, which we have alluded to in a former paragraph. *Hardy and Son, Seed-growers, &c., Maldon, Essex.*

The Wheat Midge.—I have not observed in your agricultural reports any allusion to the Wheat midge, whose orange-coloured maggot is making serious ravages in the Wheat crops here, and as far as I can learn, through a considerable extent of the Weald of Kent and the adjoining part of Sussex. Here I should say that the deficiency from this cause threatens to be something like from one-fourth to one-fifth, and if this is general through England, it will most seriously affect the favourable estimates you have given of our prospects for the coming year. Hoping that this will call forth notices of the prevalence or otherwise of this little pest from your numerous correspondents. *W. C. Morland, Lamberhurst.*

Wheat Crop, Berkshire.—These Wheat ears were gathered from separate pieces of Wheat, containing in all many hundred acres; only one ear from each separate piece. As compared with last year, they seem to be at least one quarter deficient. The district whence they were taken is on the upper green sand and gravels of the country, which are good Wheat lands. *James Clutterbuck, Long Wittenham Vicarage.*

Making Beer with Sugar.—The practice of brewing from a combination of sugar and malt is rapidly extending itself in this country, and would, no doubt, be universally adopted at the present time were it known how important a saving is thereby effected, particularly to individuals brewing for home consumption who do not pay the excise duty on sugar. The following table shows the comparative cost of malt and sugar.

Price of malt per quarter		70*s.* 0*d.*	
Deduct grains at 4*d.* per bushel		2 8	
			67*s.* 4*d.*
1¾ cwt. sugar is about equivalent to a quarter of malt.			
Take Madras at 31*s.* per cwt.	1 cwt.	31*s.* 0*d.*	
	½ do.	15 6	
	¼ do.	7 9	
			51*s.* 3*d.*

Saving to private brewers 13*s.* 1*d.* per quarter. Excise duty, 3*s.* 9*d.* per cwt.; equals on 1¾ cwt., 6*s.* 7*d.* Saving to licensed brewers, 6*s.* 6*d.* per quarter. A faulty mode of employing the materials has given rise to the idea that beer made from sugar will not keep. The principal error has been boiling the sugar with the wort. This is a great mistake; the sugar should never be boiled in any stage of the operation. The Hampshire farmers brew very generally from sugar, and I have heard of a brewery in one of the home counties where, in consequence of the use of sugar, the waste beer returned by customers during the year was so much reduced as to be barely sufficient for finings. I have myself tasted capital bitter beer made according to the subjoined recipe, the excellence of which consisted, as I was informed, in the length of time it would keep without becoming hard.

Recipe.—Boil 54 gallons of water in copper; run it into mash tub, and let it cool to 90° Fahr. Put in 4 bushels malt; let it stand three hours covered with sacks, &c., to keep in steam; run into underback, and immediately pump into copper. Mix and stir 8 lbs. Hops with it. Boil three hours; run in trough to cooler, mixing 25 lbs. sugar with hand in the wort as it runs along trough. Cool to 70°, and let down into working tub. This will make very strong beer. If ordinary beer is required make second wort in same way, with some malt and Hops and 25 lbs. more sugar. Cool separately, and mix with first wort in working tub. Put 1 pint yeast into flat bowl; put bowl in wort, so that wort can just touch yeast. Let work 12 hours, during which skim off yeast three times. Keep covered except when skimming, and rack off into casks in cellar. It may work a fortnight. Fill up casks every morning with what has worked out of cork hole into tub beneath. Skim before returning it to cask, and clean away all yeast which rises to top of cask through bung-hole. Put three or four handsful of dry Hops into cask through bung-hole, and bung it up. The sugar should be of a damp pasty quality, such as low Madras. *Another Method of Mixing.*—Immediately before running wort into cooler, take out of copper two pailsful of wort and empty into small cask; mix sugar with it. Pour back into copper, mixing thoroughly, and directly run off into cooler. Do not boil wort after sugar is added. *S. C., Inner Temple.*

Food for Young and Growing Stock.—The following is an answer to a question addressed to us by a correspondent. Calves at a month old, by the 1st of April, have proved to do well on half a pint of good Oatmeal, or the same quantity of Linseed mixed in a little cold water, and boiling water poured over it, making the half pint of meal or Linseed into two or three quarts of liquid. This should be mixed 12 hours before given to the calves, as it should stand this time, and the vessel being covered it will be found then of sufficient warmth. Best Scotch oatmeal is most economical, and is perhaps better than Linseed. It should be given at first with a small quantity of milk, or the calves having been fed previously only on this will not readily take to this food; together with this, hay and some roots are a good preparation for their taking to Grass. Six weeks of this feeding will suffice, giving them the mixture only once a day the last week, and lowering its quality, to wean them from it; and by this time they will take to Grass as their only and sufficient food, if good wholesome pasture. Water should only be given very sparingly when required from drought, and on no account should calves at Grass have unrestrained access to spring water. As the nights get cold in October, they should have a small quantity of hay, and the tops of Carrots or early Turnips will now forward their growth until December, when a regular supply of Swedes with chaff of Oat or Barley straw, will keep them in good growing condition until the time for grazing, or they might be kept well through the summer on chaff and a plentiful supply of Mangold Wurzel until early Turnips take its place. This treatment should be repeated the second year, unless steers are intended to be fattened at two years old; therefore in October, at one year and a half, or at two years and a half old, they should get chaff of good hay, with two quarts of Barley or other meal, either from Oats, Beans, or tail Wheat, or instead of meal 3 lbs. of oilcake, with as many Swedes as they will consume given them twice each day, with no water. Heifers should be kept on similar treatment until the last winter before calving, when roots are not needed, and can be given to greater advantage to other stock, as a plentiful supply of straw, and a little hay, for the last two months before calving, is more healthy and likely to avoid risk from inflammation. At this time good hay, good water, which is very essential, and good pasture, is the staple food for cows in milk and during the three months of winter, December, January, and February, during which time it is usual they are dry before calving. The straw-yard, as beforesaid for heifers, with a good supply, a stream of water, shelter, and a little hay added a month before calving, will keep cows in good condition. *C. C. M.*

Deep Draining.—I quite concur with Mr. Sherrard, p. 540, as to the efficiency of deep draining. This estate, the greater part of which is strong clay, has been thoroughly drained within the last five years with 4-feet drains and upwards, and the results are highly satisfactory. The average crop of Wheat prior to draining and deep cultivation was five sacks to the acre. Last year the average was ten, and it promises to be equally good this, the straw being stiff and ripening of a good colour, and not laid so much as in many places. One field in particular has passed all expectation. Being close to the covers, it was sown with tall Sunflowers; that crop not coming so well as could be wished, after the first hoeing half a bushel of Buckwheat was sown to the acre, which is now a most luxuriant crop, many of the stems being as large as the finger, and upwards of 4 feet high. *J. W., Bignor Park, Petworth.*

Mr. Mechi's Lecture at Carlisle.—On this gentleman's opinions at Carlisle it was objected that the rain-fall was too great in Cumberland to allow of threshing in the fields; surely the rain-fall in Ireland is equal to, if it does not exceed, that of Cumberland, yet many of the small farmers in Ireland, for want of barns, thresh out their corn (Oats) (Wheat is not grown by them or by those who are not rich enough to have such an accommodation) in the fields, or more generally on the highways. Thin and rank sowings also met with objections on the same ground, or rather the same water feeling, the greater humidity of the climate to that of Tiptree Hall, yet I have not found in Ireland thin and rank sowings, where the thinness of the sowing has been proportional to the rankness of the soil, so liable to lodge or be beaten down by our heavy rains and storms as thick sowings; indeed, it is a common remark on a thick sown field, that if the harvest comes wet it will be lodged and little worth, and also that in a thin sown field the head will make up for any deficiency of stock; and, indeed, in proportion to the thinness of the sowing so is the strength of the stem. Barley in rows, 21 inches apart, has in rank semi-garden ground been lodged with four-sevenths produce of grain and straw 4 feet long, where, with intervals of 42 inches and 21 inches, it has been quite erect with seven-sevenths produce of grain and straw 5 feet long. Many years ago an English steward (a Mr. Alsop) of the late Lord Thomond's introduced in Cork (called the water-pot of Ireland) the drilling of Wheat at 9 inches, with a saving of one-third of the seed (the quantity sown being under two bushels). I believe not much more than one-and-a-half, and with this sowing he had crops superior to the general run of the country. *J. M. G.*

Societies.

ROYAL AGRICULTURAL OF ENGLAND.

Trial of Reaping-Machines.—Mr. Miles, M.P., the President of the Royal Agricultural Society of England at the Carlisle meeting, having on that occasion placed the crops on his farm at Abbot's Leigh, near Bristol, at the disposal of the Society for any subsequent trial of reaping machines that might be found requisite, the Stewards of Implements have availed themselves of this liberal offer, and have made arrangements that the *private trial* of the selected machines shall take place under the immediate superintendence of the Stewards, the Field Judges, and the Consulting-Engineer of the Society, in the presence of the respective implement makers, on Wednesday, the 29th of August, at 11 o'clock in the forenoon. This trial will be strictly private; but Mr. Miles has proposed to the owners of the machines that a *public trial* should take place on the following day, namely, on Thursday, the 30th of August, in order that an opportunity may be afforded, to all persons interested in the subject, of viewing the reaping machines at full work under ordinary circumstances.

Highland and Agricultural Society: *Half-yearly General Meeting.*—The Earl of Rosslyn in the chair. Eighty-seven gentlemen, 70 of whom are tenant farmers, were balloted for and admitted as members.

Agricultural Statistics.—Mr. Hall Maxwell then laid on the table the report by the Society to the Board of Trade, in reference to the statistics of occupants rented at less than 10*l.* in the lowlands, and 20*l.* in the highlands, which completed the statistical inquiry for 1854, of which the following is an abstract:—

	No. of Occupants.	No. of Arable Acres.	Total Stock.
1. Holdings in 26 counties rented at less than 10*l.*	16,144	77,220	47,760
2. Holdings in 7 counties rented at less than 20*l.*	26,085	160,438	287,548
Total	42,229	238,170	334,308

Mr. Hall Maxwell stated that Government having resolved to continue the inquiry, the Society had again consented to undertake the charge of it, and that the greatest part of the schedules for the present year had been issued, about 40,000 having been sent out since the 2d of July. He had pleasure in being able to report that the returns were being made promptly and accurately, above 4000 replies having been received within a week, and he begged to impress on every one the importance of completing and sending back his schedule. This was the more necessary, in consequence of a desire strongly expressed by the Board of Trade to have the average of crops published, if possible, before the rise of Parliament in August, which could only be accomplished in the event of no delay being incurred on the part of those to whom schedules had been sent. Last year the schedule included columns for acreage calculated to cover the whole area of a farm, the land in grain and in green crops, in fallow and in Grass, in sheep walks, waste, woods, houses, gardens, &c. So far as regarded the main object of the measure, the columns in the schedule of 1854 applicable to Grass, sheep walks, waste, wood, &c., were not absolutely required; and while these returns were not required for determining the produce of food, they were worse than useless, because deceptive in any question connected with area, and only calculated to create erroneous conclusions, and to weaken the confidence that might be otherwise reposed in the proper results of the inquiry. On these grounds, and on the general principle of excluding from statistics that which cannot be accurately ascertained, it was determined by the directors to curtail the acreage columns by restricting them to land under tillage—that is to say, land actually under crop of any description, in bare fallow, and in Grass under rotation. The two latter columns might, with reference to the food returns, have been omitted; but their presence made the schedule and the answers under it complete as regarded the tillage lands of Scotland, the extent of which could, with reliable accuracy, be given by every occupant.

Miscellaneous.

Oilcake.—The average composition of the cakes from different localities does not differ to any great extent; and the subjoined table, giving the average amount of oil, albuminous and saccharine matters in those cakes, of which more than one sample has been analysed, will suffice to render this obvious.

	No. of Analyses.	Oil.	Albuminous matters.	Saccharine matters.
British, ...	7	12.90	28.47	39.01
American, ...	8	12.96	28.28	34.22
Copenhagen	2	12.21	29.75	34.92
Flensburg ...	2	12.23	24.55	23.99
Italian ...	2	7.67	31.74	37.87

As far as the first four of these varieties are concerned, it is manifest that their composition is so similar that it may for all practical purposes be termed identical; the proportion of oil and albuminous matter in no case varying to the extent of much more than 1 per cent. The Swedish, Sonderberg, and Konisberg cakes contain a somewhat smaller quantity of oil—averaging about 10 per cent.; and the latter falls materially short in the quantity of albuminous matters. The Italian and French cakes are remarkable for the small proportion of oil which they contain, and, as a necessary consequence, by the proportionate increase in the albuminous compounds. The quantity of oil averages about 7 per cent.; and it is remarkable that Professor Way, in his analyses, found Silician cake to give, on the average, 6.80 per cent. of oil, although he found as much as 11.84 in Italian cakes. *A priori* we should have anticipated the smallest proportion of oil in home-made cake, as in most cases the machinery employed in the oil-mills of this country is much superior to that used abroad. Although we find that when the average is taken all cakes are tolerably similar, matters are altered when individual samples are compared, for then the differences become very material. Comparing, for instance, the different samples of American cake, we find that the oil varies from 9.5 up to 16.17 per cent.; that is to say by nearly 30 per cent. of the whole; and similarly the albuminous compounds fluctuate between 26 and 31 per cent. As a general rule, the higher the oil the lower the albuminous matters; but frequent exceptions are found, as some cakes are found to be remarkably rich in both. The estimation, however, of the feeding value of the different samples is a matter attended with some degree of difficulty, and must turn upon the point whether the oily or the albuminous compounds are most important in promoting the fattening and growth of cattle. At one time we held that the latter deserved the preference, and that they might be correctly taken as the measure of the value of any sort of food. We now know that this is not absolutely correct, for it has been distinctly recognised that a proper proportion must subsist between the different classes of nutritive matters; so that if we had a food containing abundance of albuminous matters, it would be of inferior value, unless a proper quantity of oily and saccharine matters were also present. In estimating the value of a Linseed cake it appears to me that we must take into consideration both substances, but that the greatest weight is to be attached to the albuminous compounds; thus, for example, the first sample of American cake, containing 13 of oil and about 31 of albuminous matters, and the Dublin cake, are to be preferred to any of the other samples. *Dr. Anderson, in the Transactions of the Highland Society.*]

Calendar of Operations.

AUGUST.

Border of the Fens, *August.*—"How is the glass?" has been the curious inquiry of many farmers during the last month whenever a heavy rain occasioned fears that it would continue; and, perhaps, at no former time was favourable weather more needed or has been more efficacious in maturing the corn crop than during that period, for although on clay lands and among the best loams the Wheat may have shown from seed time an unvarying progress, and maintained unchecked a regular growth and good appearance, yet it must be admitted that on all light lands it has since February been in an extremely precarious state, and even now throughout the Fens large tracts remain to attest the sad effects of wind and frost, whilst a considerable breadth of Wheat land has been either ploughed up or mown off to take the chance of half a crop of Oats or Coleseed: nor have the Oats escaped, many large pieces may be seen with a scant and uneven plant, rivalled and surpassed by intervening ling weed, which seem always ready to dispute the occupation with invalided corn, and have this summer assumed everywhere from the warm moist weather a rank luxuriance that has taxed all the energies of cultivators of fertile land to check or subdue. The Wheat "flowered" unusually late, yet without ripening too fast. So rapid has been the change, and so greatly has it been improved by alternate showers and sunshine, that we have heard it remarked by one gentleman who stole away from his farm for a fortnight that on his return he had 200 more quarters of Wheat than he could have estimated the future yield at when he left; indeed, we are fast getting out of the risk of blight and mildew. A fine bold ear seems everywhere to prevail, the thin crops have tillered out more than could be calculated on, and in this neighbourhood even the heavy Wheats have not been laid so much as might have been anticipated; the fact is, the straw is generally strong, and of a good colour, and the crops are now rapidly approaching maturity. It is stated that next week some odd pieces of Wheat will be commenced, and if the present fine weather continues, on the 13th a great deal of Highland Wheat will be fit for cutting. Oats are this year likely to be ready first, and we shall put some men in a fine piece of 12 acres next Wednesday. Barley is heavy, but knocked about with rain, and, therefore, will not be in a condition to be cut for a fortnight. We have just concluded harvesting hay and Clover; with a little patience, which is not "the badge of all our tribe," we have succeeded in getting rather good crops of both in capital condition, and as the bottom Grass is unusually thick, the eddishes of the late cut promise abundance of keep for the lambs which are removed from the ewes in the first week in August. Sheep require constant attention just now, flies being so troublesome; and it will be borne in mind that a few hours after being struck, if not discovered, will suffice to break the skin and inflict a memorandum on the unlucky sheep, which by getting wet, or by rubbing, or by scouring, has attracted the attentions of those most unwelcome but inevitable tormentors. After separating the ewes, and as soon as the flow of milk is somewhat diminished, the "culls" should be picked out, to be either sold or put into a good pasture in preparation for a future market. Beef is now selling well at from 8*s* to 8*s*. 6*d*. per stone; mutton also has advanced lately to about 7½*d*. per lb. Green crops require great care to keep clean and get out of hand before harvest; the Turnip crop is generally forward and promising; Mangolds grow fast; and we hear partial complaints of Potatoes; but as the tops have not yet been checked, we presume that the disease pays only partial visits. Flour has fallen 2*s*. or 3*s*. per sack; good household flour now selling at 56*s*. Barley and Barley meal both very dear; cake also is high; and, indeed, all feeding stuffs appear to be making stiff prices. *J. W., Peterborough.* [This was written August 4].

South Hants, *August* 8.—The crops in these parts looked more promising a few weeks back than at present. Wheat and Barley is blighted, and in the ears of Wheat beetles and small red maggots seemed to abound, as in a single ear half a dozen of these could be detected, and by the aid of a magnifying glass these insects were clearly exhibited. The straw of the Wheat plant, and also of Barley, is dark and dingy in colour, wanting that bright and clean appearance so common in healthy plants. The harvest will not be general for three weeks or a month to come. The Turnip crops in many places are very fine, in others the fly carried off the braird of the earlier sown crops as well as the later; indeed, the fly has been more busy this season for weeks together than was ever known—hundreds of acres have been ploughed up and re-sown. The Potato crop, so promising, has this week exhibited too plainly the presence of disease; early and late sorts are going off rapidly, and the decaying haulm is very offensive. Much hay is still about delayed by repeated showers, but these have amply compensated the farmer by the advantage derived from them to his Turnip crops. The Clover Hay was housed in good order, but the crops in general very light. We have seen an instance of a remarkable yield of Wheat of last year's crop, viz., 56 to 58 bushels per acre. The crop of this year is very doubtful, as the late high winds have been highly injurious to the Wheat and Barley. Tares very fine. *R. S. S., Hants.*

Notices to Correspondents.

Blood Manure: *B.* Blood is used by very many manure companies now. The Nitrophosphate Manure Company, the Cyanic Manure Company, the so-called Manchester Sewage Manure Company, and the London Manure Company, besides others, use it. The Nitrophosphate Company throw bones and blood together, and add sulphuric acid, thereby manufacturing a manure which, as it contains soluble phosphates along with nitrogenous manure, is as nearly perfect, whether for roots or corn, as anything ordinarily need be.

Hooded Sheaves: *W B.* The Warwickshire system is best for wet weather; high reaping, four sheaves stuck down on the long stubble and two sheaves reversed overhead with a band round both. But this is otherwise a bad plan, and this glorious weather has relieved you already from difficulty.

Light Carts: *D* asks who was the builder of a set of light carts lately sent to the Crimea. He saw them pass through the city of London, about 24 of them drawn by one horse.

Mangold Wurzel: *Alpha.* While the leaves are green they assist the growth of the plant, and when they wither they are useless as food. We would not as a general practice strip the lower leaves: you hinder the growth in doing so, and so injure the crop in more than one way.

Oats: *Rawdon Briggs.* The crop seems blighted and prematurely ripened. There are always complaints of this kind more or less prevalent at this season; blight may be the result of deficiency or excess in any one of the fifty influences to which a living plant is exposed.

Piper's Thickset: *W C M.* This and the velvet eared, the one red and the other white, are our two shortest Wheats. The former is not remarkable except for its short straw and thickset ear.

Trifolium incarnatum: *Fitz.* You must not plough the land. It must be hard or only just softened by a shower, and the seed sown and harrowed in. Manuring, if needed, must be as a top-dressing hereafter.

Salt: *H M.* You cannot depend on it as a fixer of ammonia, for although under some circumstances it and carbonate of ammonia undergo mutual decomposition, and so the latter assumes the fixed state of muriate of ammonia, yet practically in the dungheap it is not a fixer. Lime and salt when long mixed contain a quantity of carbonate of soda, which will hasten the decomposition of manure but does not fix ammonia.

Smut: *G Beardmon.* So large a quantity is very unusual. Could you give the history of the crop from seed time; it might be interesting.

*** We have further reports of the Carlisle Show, which are delayed by the publication of our crop reports.

THE HARVEST.

DRUMMOND'S IMPROVED REAPING SCYTHES continue to give every satisfaction, and the demand is yearly on the increase. They are as usual got up with every possible care, and are fitted with the very best picked blades. Price for three Scythes complete, 30*s*.; do. for six, 56*s*. Carriage paid to the principal Railway Stations throughout the kingdom. W. Drummond & Sons, Seed and Implement Warehouse, Stirling, N.B.

*** To prevent disappointment early orders are respectfully requested.

N.B. Unknown correspondents will please accompany their orders with a remittance.

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London.
Drawings forwarded by post.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1¼ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water-butt or Cart, as shown in drawing.

Price of Pump and Union, 50*s*.
1½-inch Flexible Rubber and Canvas Suction for ditto, *s*. 6*d*. per foot.
1½ Gutta Percha Suction, 1*s*. 6*d*. per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3*l*. 3*s*. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1*s*. 6*d*. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3*s*. 6*d*. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, John Warner & Sons, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells of a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead,	1	12	0

☞ Catalogues Gratis.

UNDER THE PROTECTION OF HER MAJESTY'S ROYAL LETTERS PATENT.

JOSEPH PASCALL begs to announce to the Horticultural and Floricultural Public—amateur and professional—that he is manufacturing an entirely new Garden Pot, which possesses, in a cultural point of view, many permanent advantages over pots now in general use. In the first instance, it is intended to be used in the growing, forcing, and blanching of Seakale in winter; blanching Seakale, &c. &c. in the open garden; and, when not required for these purposes, it is so constructed as to be made available in the cultivation of plants of every description. These pots are manufactured in various forms and sizes, viz.—as propagating, seedling, shading, and protecting pots and pans; and are likewise admirably adapted to the cultivation of Mosses, Ferns, and many rare and choice exotic plants.—For a more detailed description see *Gardeners' Chronicle*, July 7, p. 453.

Joseph Pascall, Patentee.

West Kent Potteries, Chislehurst, Kent.

FILTRATION BY ASCENSION.

FREDK. RANSOME & CO., sole Patentees of the New AUTOMATON PURIFIER; also manufacturers of every variety of FILTERS (Portable or for Immersion) fitted with the Patent Purifying Medium. Pure Water, in any quantities, to Water Companies, Manufacturers, and others, obtained at a very moderate cost by the use of Ransome's Filtering Slabs. An Illustrated Priced List on application to the Depôt, Whitehall Wharf, Cannon Row, Westminster, or at the Patent Stone Works, Ipswich. A liberal discount allowed to the Trade. Filter Manufacturers and Exporters supplied with Ransome's Patent Filtering Medium separately, on the lowest terms.

☞ Fredk. Ransome & Co. are also the Patentees and sole Manufacturers of the Patent "Iris Fountains" for Drawing Rooms, Conservatories, &c.

A liberal allowance to the trade.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Milbank Street, Westminster.

THE COMFORT OF A FIXED WATER-CLOSET FOR £1.—Places in gardens converted into comfortable Water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l*. Hermetically-sealed Inodorous Chamber Commodes, 1*l*. 2*s*., 2*l*. 4*s*., and 3*l*.; also Improved Portable Water-closets, with pump, cistern, and self-acting valve. A Prospectus, with Engravings, forwarded by enclosing two postage stamps.

At Fyfe & Co.'s Sanatorium, 46, Leicester Square, London.

Circulars free by post.

THE LATE FLOOD AT CHELTENHAM.—On Thursday, the 26th ult., the town of Cheltenham was visited by a SEVERE FLOOD, the river Chelt overflowing its banks, and causing great damage to the property of various individuals. The chief sufferers are the Nurserymen and Market Gardeners, whose land has been inundated, and their valuable stocks in some cases destroyed, and in others greatly injured. The total amount of loss to this class of property has been estimated by Messrs. Wheeler, of Gloucester, at nearly 1000*l.*, of which the large sum of 520*l.* falls upon one individual, Mr. Charles Hale Jessop, alone.

Subscription Books have been opened, and it is thought that the sympathy felt in Cheltenham for the sufferers may also, through this medium, be shown in other parts of the kingdom, especially as Mr. Jessop's name and character are so widely known and esteemed. A list of Subscribers will hereafter be published in the *Gardeners' Chronicle*, meanwhile Subscriptions are respectfully solicited, which the following gentlemen have kindly consented to receive, viz., Messrs. WRENCH & SONS, London Bridge; Messrs. NOBLE, COOPER & BOLTON, 152, Fleet Street; and Messrs. WHEELER & Son, Gloucester; or they may be sent direct to the Honorary Secretary.

Cheltenham, August 18. ANDREW PAUL, Hon. Sec.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton Garden, London.

TOURISTS, TRAVELLERS, AND OTHERS,

EXPOSED TO THE SCORCHING RAYS OF THE SUN, AND HEATED PARTICLES OF DUST, WILL FIND

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4s. 6d. and 8s. 6d. per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2s., or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN——"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

DR. DE JONGH'S

LIGHT BROWN COD LIVER OIL. Prescribed with complete confidence by the Faculty for its purity, and superior, immediate, and regular efficacy.

It is entirely free from nauseous flavour, and being invariably and carefully submitted to chemical analysis—AND ONLY SUPPLIED IN SEALED BOTTLES TO PRECLUDE SUBSEQUENT ADMIXTURE OR ADULTERATION—this Oil possesses a guarantee of genuineness and purity offered by no other Oil in the market.

TESTIMONIAL from ARTHUR H. HASSALL, M.D., F.L.S., M.R.C.P., Chief Analyst of the Sanitary Commission of the *Lancet*, Author of "Food and its Adulterations," &c. &c. &c.

"I have more than once, at different times, subjected your Light Brown Oil to chemical analysis—AND THIS UNKNOWN TO YOURSELF—and I have always found it to be free from all impurity and rich in the constituents of bile. So great is my confidence in the article, that I usually prescribe it in preference to any other, in order to make sure of obtaining the remedy in its purest and best condition."

Sold only in bottles, capsuled and labelled with Dr. DE JONGH'S Signature, WITHOUT WHICH NONE ARE GENUINE, by ANSAR, HARFORD, & CO., 77, STRAND, London, Dr. DE JONGH'S sole Consignees; and by most respectable Chemists in town and country.

Half-pints (10 oz.), 2s. 6d.; Pints (20 oz.), 4s. 9d.; Quarts (40 oz.), 9s.; IMPERIAL MEASURE.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. BATHS AND TOILETTE WARE.—WILLIAM S. BURTON has ONE LARGE SHOW ROOM devoted exclusively to the DISPLAY of BATHS and TOILETTE WARE. The stock of each is at once the largest, newest, and most varied ever submitted to the public, and marked at prices proportionate with those that have tended to make his establishment the most distinguished in this country. Portable Showers, 7s. 6d.; Pillar Showers, 3*l.* to 5*l.*; Nursery, 15s. to 32s.; Sponging, 15s. to 32s.; Hip, 14s. to 31s. 6d. A large assortment of Gas Furnace, Hot and Cold Plunge, Vapour, and Camp Shower Baths. Toilette Ware in great variety, from 15s. 6d. to 45s. the Set of Three.

WILLIAM S. BURTON has SIXTEEN LARGE SHOW ROOMS, all communicating, exclusive of the Shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares, Iron and Brass Bedsteads and Bedding), so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); 1, 2, and 3, Newman Street; and 4 & 5, Perry's Place.

METCALFE, BINGLEY, AND CO.'S OATMEAL and CAMPHOR SOAP, in tablets (registered Nov. 3, 1854). Price 6d. each. This soap will be found the purest and most perfect winter soap ever introduced to the public. It preserves the hands from chapping, and renders the skin soft and agreeable.—Sold wholesale and retail by the inventors and sole manufacturers, METCALFE, BINGLEY, & Co., Brushmakers and Perfumers to H.R.H. Prince Albert, 130n and 131 Oxford Street.

CAUTION.—To prevent fraud, each tablet bears the registered mark and the names and address of the inventors, as above.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.—The above may be obtained of most respectable Chemists, Perfumers, &c.

TO NURSERYMEN AND GARDENERS.

TO BE SOLD, a NURSERY BUSINESS, established upwards of 40 years, and successfully carried on, as the present proprietor wishes to retire. The fine situation of the grounds embraces a variety of sloping banks to every aspect. There is an abundance of fine peat soil, and an almost inexhaustible supply of fine sand. There are about 12 acres of land, with the option of having more if required. The Glass erections are very extensive, and adapted for all Propagating and other purposes. A Dwelling-house, Stable, Packing-house, Cellars, &c., in excellent condition. The Stock of Plants is select, including those recently introduced from China, California, Himalaya, Sikkim, Cape, Australia, New Zealand, and other general Nursery Stock. The distance is within two days' sail of London, and half that time by railway, and within half a mile of the General Railway Station of Aberdeen.—Full information may be obtained by addressing Mr. J. ROY, Jun., at Ferry Hill Nursery, Aberdeen, or 141, Strand, London.

TO NURSERYMEN, GARDENERS, & HORTICULTURISTS.

TO BE SOLD, by Private Contract, the BUSINESS and STOCK IN TRADE of Mr. Charles Montague Atkinson, of Gloucester, Nurseryman, consisting of a choice and beautiful Collection of Variegated Stove and Greenhouse Ornamental Plants, comprising all the newest and best soft-wooded in cultivation; also Azalias, Camellias, Ericas, &c. &c., too numerous for detail. The Grounds are situated in one of the best parts of Gloucester, and contain a general Nursery Stock. The Seed business is an important branch and is rapidly increasing. Satisfactory reasons can be given for disposing of the business.

To view, apply at the Nursery, Worcester Street, Gloucester; or to Mr. Thomas White, Green Dragon Lane, Gloucester. And to purchase apply to Mr. FREDERICK SHIPTON, Solicitor, Saint Nicholas Chambers, Nicholas Street, Bristol.

TO NURSERYMEN, SEEDSMEN, AND FLORISTS.

TO BE SOLD, in consequence of the proprietor retiring from business, a Capital Business in the above line, with a first-rate connection, and of 17 years' standing. The premises, which are convenient and well situated, will be sold, together with the Business. Such an opportunity as the above seldom occurs.—For particulars, apply to Mr. LENDON, Nurseryman, &c., Wellington, Somerset.

FANCY POULTRY.

TO BE SOLD, young BIRDS of the following breeds:—Dorking Fowl (first prizes at Colchester, 1854, and Ryde, 1855); Turkey (parent Cock and Hen weighed 43 lbs.); Goose (second prize, Ryde, 1855); Aylesbury Duck, White Peruvian Musk Duck (from birds now in the possession of the Queen); also a Cock and six Dorking Hens, adult.—For price, apply to Mr. WARWICK, Donyland Lodge, Colchester.

Dorking Eggs from prize and other first-rate birds, at 6s. 6d. per dozen, including basket, for the rest of the season.

Sales by Auction.

HURSLEY PARK, NEAR WINCHESTER.

IMPORTANT SALE OF PURE SOUTHDOWN SHEEP, &c.

MR. STRAFFORD has received instructions from Sir William Heathcoate, Bart., M.P., to announce for Sale by Auction, without reserve, on WEDNESDAY, the 22d of August next, at the Home Farm, Hursley Park, the FLOCK of PURE SOUTHDOWNS, consisting of about 700 Ewes, of various ages, with Rams and Lambs, which have been bred with great care and attention for several years, from the far-famed Flocks of the Duke of Richmond, Hon. Captain Pelham, Messrs. Ellman, Northeast, and Jonas Webb. Also a few Valuable Young HORSES, bred on the Estate; with a quantity of HURSLEY PIGS, which are chiefly descended from the stocks of the Right Hon. the Speaker, Mr. Fisher Hobbs, and other celebrated breeders, the whole of which will be found, on inspection, worthy the attention of Gentlemen seeking first-class stock, and are sold in consequence of having let two Farms recently in hand.—Catalogues, with particulars, may be had on application to Mr. STRAFFORD, 13, Euston Square, London; or of Mr. Fowlie, Red House, near Winchester.

ILFORD.

TO GENTLEMEN, NURSERYMEN, FLORISTS, AND OTHERS.

MR. GEORGE COLLIS is instructed to Sell by Public Auction, on the premises at the Nursery, Green Lane, Ilford, Essex, on THURSDAY, August 23, at 11 o'clock, without any reserve, the whole of the glass erections, consisting of two span-roofed greenhouses, a saddle boiler; hot water pipes, several pits and frames, striking-glass, and sundry other effects; also the whole of the nursery stock of Evergreens, &c., and the Greenhouse Plants, consisting of choice sorts of Azalea indica, Geranium, Fuchsias, &c.—May be viewed prior to the Sale. Catalogues may be obtained on the premises; at the Red Lion Inn, Ilford; of the principal Seedsmen in London; and of the Auctioneer, North Street, Romford, Essex.

Just Published,

A TREATISE ON ASTHMA AND DISEASES OF THE HEART.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

This day is published, price 6s., Volume I. of

NOCTES AMBROSIANÆ. By PROFESSOR WILSON. To be completed in Four Volumes.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

WILLIAM MAXWELL, 32, Bell Yard, Lincoln's Inn, Law Bookseller and Publisher; HODGES & SMITH, Grafton Street, Dublin.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14s.,

MEDICAL AND ŒCONOMICAL BOTANY; or An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, and which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of many departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable: firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

BRADBURY & EVANS, 11, Bouverie Street.

GARDENERS' CHRONICLE.—For Sale, the Volumes of 1849, 1850, and 1851, half-bound in russia; also the Numbers for 1852, and the first 36 Numbers of 1853—Apply by Letter, to A. B., 1, Shorter's Court, Throgmorton Street, London.

GARDENERS' CHRONICLE for the year 1843-3-4-5-7-8-9; folio cloth, 5s. each; Farmers' Magazine, 21 vols, 8vo, half Russia, 1l. 6s., 1800-21: Farmer's Library (Youatt's Treatises), 2 vols, royal 8vo, cloth 15s., half calf 18s., 1849; British Husbandry, 3 vols, 8vo, cloth, 15s., 1834-40: Thaer's Agriculture, 2 vols, 8vo, cloth, 12s., 1844: Marshall's Agricultural Works, 21 vols in 13, 8vo, half calf. 1l. 1s. 1796-1801; Arthur Young's various works; Reports of the Board of Agriculture (in counties) 40 vols, 8vo, bound in boards. 4l. 4s. In foolscap 8vo, with numerous Woodcuts, price 4s. 6d.,

THE PHILOSOPHY OF REPRODUCTION.

By ROBERT JAMES MANN, M.D., F.R.A.S.

"This little volume contains an account of one of the most interesting branches of physiological study, written in a style very clear and simple, though the subject is not handled superficially."—*Examiner.*

"The book is scientific and interesting, and well calculated to occupy a place among works devoted to popular instruction. We think the subject is one upon which the public has a claim for information, especially in these days of rampant quackery; and this information is, in the treatise before us, furnished in a form perfectly unobjectionable."—*Medical Times and Gazette.*

"It is long since we met with a work in which the mysteries of nature have been more happily and intelligibly revealed. . . . This most instructive and entertaining volume affords a lucid explanation of the opinions at present entertained by philosophers concerning what were once thought to be the impenetrable secrets of reproduction among living things, whether by eggs, seed, or other contrivances. From the animalcules that only microscopical eyes have ever looked upon, up to man, the most perfect of created beings, the chain of analogies is completed."—*Gardeners' Chronicle.*

GRAND
METROPOLITAN DAHLIA AND HOLLYHOCK SHOW.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of Her Most Gracious Majesty the Queen.—The last Exhibition of the above Society for the present season will take place at the Royal Cremorne Gardens, Chelsea, on THURSDAY, August 30, in conjunction with the Grand Metropolitan Dahlia and Hollyhock Show (Open to all Exhibitors).

Lists of Prizes and the Rules of the Exhibition may be had of the Secretary, J. T. Neville, Ebenezer House, Peckham.

SALISBURY HORTICULTURAL SOCIETY.—The ANNUAL DAHLIA EXHIBITION, offering the highest amount of Prizes that will be given this season at any Show, will be held in conjunction with the Horticultural Society, in the Gardens of the Lord Bishop of Salisbury, on THURSDAY, Sept. 6th.—Full particulars of John Keynes, Hon. Sec.

ROYAL PAVILION, BRIGHTON.

THE BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY will hold their Autumn Exhibition of PLANTS, FRUITS, CUT FLOWERS, &c., on WEDNESDAY and THURSDAY, 12th and 13th of September next, at the above splendid suite of Rooms and Grounds, on the same grand scale as former years. Prizes are offered with the same liberality as previously. Also the Railway Cup, value 10 guineas, for the best 24 Show Dahlias for Amateurs. By the liberality of the Railway company, all plants, &c., will be conveyed to Brighton and back, carriage-free, from all stations on the lines. Schedules can be had on application to E. Spary, Superintendent of the Exhibition; or the Secretary, E. Carpenter, 45, Lavender Street, Brighton. By order of the Committee, E. Carpenter, Secretary.

WILLIAM BARRATT, Landscape Gardener, Wakefield.
*** Plans and Estimates furnished.

JOHN HARRISON, Nurseryman, Seedsman, Florist, Landscape Gardener, &c.
Plans and Estimates furnished; Experienced Gardeners recommended; also several Young Men in the Nursery waiting for Under Gardeners' Situations.—Darlington, Aug. 25.

WANTED,
GRAPES AND PEACHES of Superior Quality. Forward to GEORGE TAYLOR, Jun., Fruit Salesman, St. John's Market, Liverpool. Terms Cash.

HOLLYHOCKS.—The collection of Hollyhocks at the Cheshunt Nurseries is now in full bloom, and may be seen daily. Packets of choice Seed, 1*s*., 2*s*. 6*d*., and 5*s*. each.—A. Paul & Son, Nurseries, Cheshunt, Herts.

PRICED CATALOGUE OF PLANTS.
THOMAS JACKSON AND SON'S Priced Catalogue of Plants may be obtained on application. It contains Stove, Orchidaceous, Ferns and Mosses, Greenhouse, Ornamental Shrubs and Trees, Roses, and Herbaceous Plants.
T. J. & Son are offering at very low prices a large Stock of Azaleas, Camellias, Ericas, Epacrises, Helichrysums, Rhododendrons, &c., well deserving the attention of purchasers.
Nurseries, Kingston, Surrey.

DUTCH FLOWERING BULBS.
JAMES CARTER AND Co.'s comprehensive CATALOGUE OF DUTCH AND CAPE BULBS, AND SEEDS, for Autumn sowing, will be published on the 1st of September next, and will be forwarded, free of charge, and post paid, upon application to James Carter & Co., 238, High Holborn, London.

FERNS.
ROBERT SIM'S 16 page CATALOGUE of his GENERAL COLLECTION of FERNS may now be had for Four Stamps. Free to all previous purchasers.
Nursery, Foot's Cray, Kent.

WILLIAM CUTBUSH AND SON beg to acquaint their patrons and friends that their ANNUAL CATALOGUE of DUTCH BULBS can be had, postage free, on application. The superior quality of their roots is well known, but as a further guarantee they obtained the Awards at the Horticultural Society's Rooms, Regent Street, last spring.
Highgate Nurseries, near London.

IMPORTED DUTCH FLOWER ROOTS.
T. F. WINSTANLEY begs to announce that his Priced Catalogue of Dutch Bulbs for the present season will shortly be ready, and can be had free on application. It contains a list of all the newest and leading sorts in cultivation, including Hyacinths, Narcissus, Jonquils, Amaryllis, Early Single and Double Tulips, Crocus, &c., all of which have been grown by one of the first growers in Holland, and can be relied upon as being good sound Bulbs, and true to name.
28, Market Place, Manchester.

RHODODENDRONS.
JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s*. each.
Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.
Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.
To the admirers of this justly noble class of Plants, John Waterer has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.
The American Nursery Bagshot, Surrey, Aug. 25.

J. DOBSON AND SON'S New Catalogue of PELARGONIUMS forwarded post-free for one stamp.
Woodlands Nursery, Isleworth.

SUPERB BALSAMS.
F. AND A. SMITH beg to solicit an inspection of their splendid Balsams, now in full bloom, from which they intend to offer seed for the ensuing season.—Dulwich, Surrey.

NEW STRAWBERRY.
KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2*l*. per 100, 9*s*. per doz., free by post, to be had of Messrs. Garraway, Mayes, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.
James Kitley, Lyncombe Vale Nursery, Bath.

KEENS' SEEDLING STRAWBERRY. — True and strong plants of the above sort for potting and bedding out can now be obtained from the grounds in which it was originally produced, on application to Warren's (late Keens') Gardens, Isleworth, Middlesex. Price 5*s*. per 100.

R. SMITH still continues to send out strong runners of his SEEDLING STRAWBERRY, SIR CHARLES NAPIER, which this season has proved itself good; both for forcing and natural it has no equal. Price 2*l*. per 100.
R. Smith, Market Gardener, Twickenham.

AZALEAS AND ERICAS.
W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.
AZALEAS 18*s*. per dozen; 5*l*. per 100.
ERICAS 12*s*. and 18*s*. per dozen; 4*l*. and 5*l*. per 100.
These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Aug. 25.

MESSRS. J. AND H. BROWN offer the following CHOICE PLANTS, which they will forward to any part.

A Bon Marché.	*s*.	*d*.
12 Orchidea Plants, grand species, one of a sort	40	0
50 Choice Greenhouse Plants (hard-wooded) one of a sort...	45	0
Camellias and Rhododendrons, fine sorts ... per dozen	30	0
Azalea indica, fine new sorts ... per dozen 12*s*. and	18	0
12 Gloxinias and Achimenes, best varieties	10	0
25 Fuchsias (small plants), best proved varieties	10	6
12 fine new Mimulus, tall and dwarf varieties	10	0
12 fine Phlox, new Perennial, varieties	12	0
25 Chrysanthemums, new large and small varieties ...	12	0

Albion Nursery, Stoke Newington, London, August 25.

SPLENDID HERBACEOUS CALCEOLARIA AND SWEET WILLIAM SEEDS.
WILLIAM BARNES has now ready for sending out a small quantity of the above Seeds, the former of which is unrivalled, and has given the greatest satisfaction to all purchasers for the last four seasons, 2*s*. 6*d*. and 5*s*. per packet.
SWEET WILLIAMS, grown from the same stock as the seed now offered, may be seen at the present time in full bloom at his Nursery, where they are pronounced by all who have seen them to be unequalled. 1*s*. 6*d*. per packet. Payment can be made by postage stamps.
Camden Nursery, Camberwell, London.

CALCEOLARIA AND MIMULUS SEED.
N. GAINES having been fortunate in saving Seed from the superb Calceolarias and Mimulus he exhibited so successfully at the Royal Botanic, Regent's Park, and Crystal Palace Exhibitions, he is prepared to offer it at 5*s*. per packet. Early orders are solicited, as the stock is very limited.
N. G.'s collection of Pæoneasters, Verbenas, and Dahlias are now in flower, and can be seen gratis any day, Sundays excepted, at the Nursery, Surrey Lane, Battersea.—August 25.

PRIZE CALCEOLARIAS.—Packets of Seed saved from the group of Seedling Calceolarias, to which a Prize was awarded at the Great Exhibition at the Crystal Palace, may still be obtained (price 10*s*. 6*d*.) by application to William Sandford, Gardener to Mr. Henchman, Edmonton.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.
LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior
CINERARIAS AND CALCEOLARIAS,
which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.
Packets of each, sealed and warranted by them, at 2*s*. 6*d*., free by post.—Exeter Nursery, Exeter. Established 1720.

SPOTTED CALCEOLARIA & CINERARIA SEED.
F. AND A. SMITH beg to offer seed of the above at 2*s*. 6*d*. and 5*s*. per packet. They obtained a Certificate of Merit from the Floricultural Society of London for a Collection of Seedling Cinerarias, from which the seed they now offer has been saved. Both Calceolarias and Cinerarias are well known to the London trade as pre-eminent in colour, habit, and form.
Dulwich, Surrey.

TO GARDENERS.
WANTED, half an ounce or more of warranted FIMBRIATED PRIMULA SINENSIS SEED, White and Red; for the Trade, say price.—Address A. B., White House, Marsh Lane, Tottenham, Middlesex.

WANTED, a quantity of BLACK JAMAICA and QUEEN PINES, either suckers or rooted plants that will fruit next year. They must be clean. This would be a good opportunity for any one giving up business to dispose of the whole stock. Also a quantity of the Coniferæ, particularly of the Deodar and of Araucarias; also Seeds of the Coniferæ. Terms, cash.—Address, with prices, F. M., Post Office, Huddersfield.

TO BE SOLD, a Case of Imported ORCHIDS, containing 54 pieces, mostly large and principally in fair condition: varieties of Oncidium, Epidendrum, Brassia, Schomburkia, Ionopsis, Phaius, Hedychium, &c.: price 2*l*. 14*s*., or may be selected from at 2*s*. each. To be seen at Mr. George Roberts, 32, Moorgate Street, London.
Also a small number of Cones of Abies Menziesi, from N.W. coast of America, 2*s*. each, or 2*s*. 4*d*. post free.

TO NURSERYMEN AND GARDENERS.
REIGATE SILVER SAND, 12*s*. per ton, 1*s*. 6*d*. per bushel, or 16*s*. per ton, delivered to the London Wharfs or Railways, or within a circuit of five miles. Sacks 2*s*. each. Kentish and other Peats and Loam of excellent quality.

HOW TO KILL RATS AND MICE BY HUNDREDS.—A Receipt may be had, honestly worth 20*l*., without trouble, by sending 30 postage stamps and a directed envelope to Mr. William Franklin, Post-office Street, Norwich, who will forward it with plain instructions, &c. This is a most extraordinary remedy, such as no Farmer, Merchant, or Miller ought to be without, as it will save them pounds yearly by killing every Rat or Mouse either in the field, stack, or house.

WASPS! WASPS!—The finest FRUIT in England will be secured from Wasps, Flies, Birds, &c., by using HAYTHORN'S HEXAGON GARDEN NET, to be seen in most Gardens. Patterns, prices, and testimonials free by post. Orders directed to Mr. Haythorn, Nottingham, will have immediate attention.

FISHING NETS.—A 20-yard Drag Net, with Purse complete, 2*l*. 10*s*. A Single Walled Drag Net, any length and depth, 1*s*. per square yard. Casting Nets, complete, 1*s*. to 1*s*. 6*d*. per yard, measured round the lead line. Flue Nets, any size, 1*s*. per square yard, complete. Minnow Nets, Eel Nets, and Landing Nets equally cheap, all warranted first-rate quality and workmanship.—At W. Cullingford's, 1, Edmund Terrace, Ball's Pond Road, Islington, London.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d*. per square yard; 200 yards, 14*s*.; 500 yards, 30*s*.; 1000 yards, 50*s*. Scrim Canvas, for Wall Fruit. — At LIDGINGTON and Co.'s, Rick Cloth, Tent, and Waterproof Cloth Manufacturers, 17, Smithfield Bars, City, and Old Kent Road, Southwark; Emigrant Outfitters, Ship Chandlers, and Export Merchants, Brunswick Street, near the East India Export Dock, Blackwall.

HOSE PIPING.
WAITHMAN'S PATENT FLAX HOSE PIPING will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe.
Manufactured only by Waithman & Co., Bentham, Lancaster.
No. 1 Quality, Inches in Diameter and Price Per Yard:—½, 9*d*.; ¾, 11*d*.; 1, 1*s*. 1*d*.; 1¼, 1*s*. 3*d*.; 1½, 1*s*. 5*d*.; 1¾, 1*s*. 7*d*.; 2, 1*s*. 9*d*.; 2¼, 2*s*.; 2½, 2*s*. 3*d*.; 2¾, 2*s*. 6*d*.; 3, 2*s*. 9*d*.
Super Extra Stout Quality:—2, 2*s*.; 2¼, 2*s*. 3*d*.; 2½, 2*s*. 6*d*.; 2¾, 2*s*. 9*d*.; 3, 3*s*.
No. 0, a cheaper Hose, to bear a low pressure for Garden and Agricultural purposes, at greatly reduced prices:—1, 9*d*.; 1¼, 11*d*. 1½, 11*d*.; 2, 1*s*.; 2¼, 1*s*. 3*d*.; 2½, 1*s*. 6*d*.
The Hose is Burnettised at an extra charge of 3*d*. per yard.
Union Joints, Branch Pipes, and Jets are also supplied.

IRON GATES, HURDLES, FENCING, ETC.
J. BULLOCK AND CO., Hope Iron Works, Primrose Street, Bishopsgate, Ironfounders and manufacturers of the above; also Verandahs, Conservatories, Staircases, Iron Roofs, &c. N.B. Iron and Wire Fences fixed in all parts of the country by competent workmen, or the materials supplied painted or galvanised ready for fixing, and packed for shipment. Estimates on application.

UNDER THE PROTECTION OF HER MAJESTY'S ROYAL LETTERS PATENT.
JOSEPH PASCALL begs to announce to the Horticultural and Floricultural Public—amateur and professional, that he is manufacturing an entirely new Garden Pot, which possesses, in a cultural point of view, many permanent advantages over pots now in general use. In the first instance, it is intended to be used in the growing, forcing, and blanching of Seakale in winter; blanching Seakale, &c. &c. in the open garden; and, when not required for these purposes, it is so constructed as to be made available in the cultivation of plants of every description. These pots are manufactured in various forms and sizes, viz.—as propagating, seedling, shading, and protecting pots and pans; and are likewise admirably adapted to the cultivation of Mosses, Ferns, and many rare and choice exotic plants.—For a more detailed description see *Gardeners' Chronicle*, July 7, p. 458.
Joseph Pascall, Patentee.
West Kent Potteries, Chislehurst, Kent.

FILTRATION BY ASCENSION.
FREDK. RANSOME & CO., sole Patentees of the New AUTOMATON PURIFIER; also manufacturers of every variety of FILTERS (Portable or for Immersion) fitted with the Patent Purifying Medium. Pure Water, in any quantities, for Water Companies, Manufacturers, and others, obtained at a very moderate cost by the use of Ransome's Filtering Slabs. An Illustrated Priced List on application to the Depôt, Whitehall Wharf, Cannon Row, Westminster, or at the Patent Stone Works, Ipswich. A liberal discount allowed to the Trade. Filter Manufacturers and Exporters supplied with Ransome's Patent Filtering Medium separately, on the lowest terms.
Fredk. Ransome & Co. are also the Patentees and sole Manufacturers of the Patent "Iris Fountains" for Drawing Rooms, Conservatories, &c.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER,

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS & WORKMANSHIP.

GRAY & ORMSON, DANVERS STREET, CHELSEA, LONDON.

GRAY AND ORMSON, Danvers Street, Chelsea, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and they can with the greatest confidence give the most satisfactory references to all by whom they have been favoured with orders. Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

THE NOBILITY AND GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through the Houses and Pits affording bottom and bottom heat in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3s. 8d. per day, as the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature.

splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings and Catalogues of Plants, Vines, Seeds, &c., forwarded on application to JOHN WEEKS & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. The Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, occupying only 5 ft. by [illegible] The Houses heated consist of forcing-houses, various descriptions, many of them very wide and lofty dimensions, in length [illegible] and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the severe winter [illegible] us 3s. per day, and we have [illegible] and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

JOHN WEEKS & Co., King's Road, Chelsea, London.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*: 50 plants, 12*s.*: 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. LINDLEY describes it as being exhibited at Chiswick, July 11, 1855:—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle*, Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"WARD'S *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

SUPERB NEW STRAWBERRIES,
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—Nicholson's Ajax, Ruby, Fill-basket, and Captain Cook, 6*s.* per 100; Sir Harry (Underhill's), 25*s.* per 25. Sir Charles Napier (Smith's), 12*s.* per dozen: 1*l.* 10*s.* per 50. Admiral Dundas (Myatt's), 16*s.* per 25; 1*l.* 10*s.* per 50. Nimrod (Pince's), 10*s.* per 100 plants.

A SELECTION OF THE BEST OLDER STRAWBERRIES.—Black Prince, 4*s.*; British Queen, 4*s.*; Eleanor, 4*s.*; Old Pine, 4*s.*: Eliza (Rivers's), 7*s.*; Surprise, 7*s.*; Victoria (Trollope's), 4*s.*; Goliah (Kitley's), 4*s.*; Bicton Pine (White), 5*s.*; Keens' Seedling, true, 4*s.*; Old Roseberry, 4*s.* per 100 plants. Box included. The above prices will be reduced whenever a reduction is made by the raisers. A descriptive Circular of the above sent on application. A Post Office Order payable at Yarm, Yorkshire, is requested with the order.

"SIR HARRY."—To this STRAWBERRY has been awarded at all the Horticultural Exhibitions the highest honours, where it has competed, namely:—

1854.—Chiswick, first class certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize.

1855.—Edgbaston Botanical Gardens, first prize, in pots (forced): Handsworth and Lozells, Hampstead Park, first prize (forced): Edgbaston Botanical Gardens, first prize—the Judges declared it the best Strawberry in every point on the table, superior to Keens' Seedling, Cremorne Seedling, British Queen, Mrs. Trollope, &c.; Lancaster, first prize, and pronounced by the Judges to be the finest and best tasted Berry in cultivation; Preston, first prize; Carlisle, first prize; Wolverhampton, first prize, and certificate of merit; Watford, first prize; Aylesbury Horticultural Society, first class certificate.

Plants are ready for sending out (not less than a score).

Prices:—100 plants, 4*l.*; 80, 3*l.* 13*s.* 6*d.*; 60, 2*l.* 16*s.*; 40, 1*l.* 18*s.*; and 20, 1*l.* Plants may be had in pots (not less than 10), at 2*s.* each.

Apply to Mr. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham. Each application to be accompanied with a Post Office Order (on Birmingham), to receive attention.

For the Cultivation of Strawberries, refer to Mr. Underhill's Treatise, which may be obtained from a Bookseller in every principal town, where also may be obtained a handsome Lithograph of a plant of "Sir Harry" in full bearing.

STRAWBERRIES.

NEW STRAWBERRIES.—The following fine varieties have been thoroughly proved this season, and given the greatest satisfaction, viz.:—Sir Harry (Underhill's), 2*l.* 10*s.* per 100, or 7*s.* 6*d.* per dozen; Caroline Superb (Kitley's), 1*l.* 10*s.* per 100, or 5*s.* per dozen; Omar Pacha (Ward's), 1*l.* per 100, or 3*s* per dozen; Colonel Dundas, 1*l.* per 100, or 3*s.* per dozen: Sir Charles Napier, 1*l.* per 100, or 3*s.* per dozen; Magnum Bonum, 15*s.* per 100, or 3*s.* per dozen; and all other fine old varieties, such as Trollop's Victoria, Ajax, Ruby, Eleanor, Nimrod, Prince of Wales, British Queen, Black Prince, Prolific, Keens' Seedling, and all others worth cultivating, at 4*s.* per 100.

SEEDLING HOLLYHOCKS, not to be surpassed, saved from all the finest and best varieties now in cultivation, and such as will bloom well next season, 1*l.* per 100, or 3*s.* per dozen.

SWEET WILLIAMS, from 50 of the most select and choice varieties ever grown, 4*s.* per 100, or 2*s.* 6*d.* for 50.

ANTIRRHINUMS.—Plants saved from a most splendid collection of striped and spotted varieties, 4*s.* per 100, or 2*s.* 6*d.* for 50.

FINE SCARLET GIANT BROMPTON STOCK.—White ditto, Crimson ditto, all 4*s.* per 100, or 2*s.* 6*d.* for 50.

The Plants before mentioned are now ready for planting out, and are such that must ensure satisfaction, and the whole or any part of the above will be sent, securely packed, on the receipt of a post-office order or penny postage stamps to the amount; or 25 of any of the new Strawberry Plants can be sent by post, when the charge will be 1*s.* extra for postage.

SEEDS. SEEDS.

HOLLYHOCK, saved from all the finest and best varieties in cultivation, 1*s.* per packet.

SWEET WILLIAM, saved from 50 distinct varieties, 1*s.* per packet.

ANTIRRHINUM, saved from a most splendid collection of striped and spotted varieties, 1*s.* per packet.

The True Old BATH COS LETTUCE (the best ever cultivated), 1*s.* per packet.

*** Every order must be accompanied by penny postage stamps, or post-office order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somerset.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen.—The above Bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have just arrived, and may be obtained at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall Mall, near Waterloo Place, London.

CHOICE NEW FUCHSIAS, ETC., OF THIS SEASON.

HENRY WALTON, FLORIST, &c., Edge End, Marsden, near Burnley, Lancashire, is now sending out "the White Corolla'd," and "Banks," and other new Fuchsias, at 18*s.* and 21*s.* per doz. (nice healthy plants), post free or hamper and package included, or 2*s.* 6*d.* to 3*s.* 6*d.* each, for names of which see Advertisement in *Gardeners' Chronicle* of August 11th and previous Numbers.

New Verbenas of this season, 15*s.* per doz., or 1*s.* 6*d.* each. Choice Cineraria seed saved from the finest named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* per packet, post free.

Post-office Orders are respectfully requested, with all orders (unless reference is given) payable at Marsden, Lancashire.

SPLENDID NEW BEGONIA,
SEMPERFLORENS SAUNDERSI.

GARAWAY, MAYES, AND CO. are now prepared to execute orders for this fine Seedling Begonia (raised by Mr. F. Saunders, Gardener to W. Miles, Esq., M.P., Leigh Court), which is, without exception, the most useful and beautiful variety in cultivation. The original plant first bloomed in May, 1854, when only 6 inches high, and has continued without ceasing to produce from the axils of every leaf its splendid panicles of transparent vermilion buds, which develope to fine clear brilliant rose flowers, emitting a most agreeable odour. Its habit is close and compact, seldom attaining more than 3 feet; foliage small and extremely bright, forming altogether an object of beauty unrivalled by any other variety in its class. Price 10*s.* 6*d.* each, with an allowance to the trade of one upon every three ordered; also a few extra sized plants at 15*s.* and 21*s.*

Durdham Down Nurseries, Bristol.

THE PAMPAS GRASS,
"GYNERIUM ARGENTEUM."

LUCOMBE, PINCE, AND Co. have now for sale a healthy stock of well established Plants of the above, which will bloom finely this autumn, varying from one to two and three flower stems. Few Plants are more ornamental than this gigantic Grass, the leaves (which are more than 7 feet in length curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from to 6 to 8 feet surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time. Prices and full particulars may be had on application to

LUCOMBE, PINCE, & Co., EXETER NURSERY, EXETER.
Established 1720.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

VERBENAS, including all the new and best kinds, both English and French, at 9*s.* to 18*s.* per dozen.

Large Flowering and Pompon CHRYSANTHEMUMS, strong flowering plants, 9*s.* to 12*s.* per dozen.

An assortment of Tropical and Hardy FERNS, of about 200 species, including some of the Arborescent kinds from Valdivia and Juan Fernandez, which are not to be seen in any other European collection, prices from 1*s.* 6*d.* to 10*s.* 6*d.* each, except in a few of the rare sorts, which will be from 105*s.* to 210*s.* each.

A large collection of ORCHIDEOUS PLANTS, of most of the leading sorts in cultivation, many of which have been imported during the last six months from Guatemala, Orizaba, Venezuela, the West Indies, Borneo, and Assam, in large numbers, and can therefore be offered at very *different prices* from what is *usually charged* for the same class of plants.

HUGH LOW AND CO., Clapton Nursery, London.—Aug. 25.

FLOWER SEEDS FOR PRESENT SOWING.

BASS AND BROWN'S superior Selected Seeds per packet, as under:—

CALCEOLARIA, choice, 1*s.* From new vars. of our superb Collection, Extra 2*s.* 6*d.*—GERANIUM, choice, 1*s.* Extra from new vars. of our superb Collection, 2*s.* 6*d.*—GLOXINIA, choice, 6*d.* Extra from new vars. of our superb Collections, 2*s.* 6*d.*—VERBENA, choice, 1*s.* Extra from new vars. of our superb Collection, 2*s.* 6*d.*—CARNATIONS, extra from 400 vars., 2*s.* 6*d.*

For a variety of other choice seeds for present sowing see advertisement in *Gardeners' Chronicle*, August 18.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s.* 6*d.* and 5*s.* each; the finest quality of CALCEOLARIA is only offered at 5*s.*; second quality, 2*s.* 6*d.*

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, Aug. 25.

SPLENDID SPECIMEN GREENHOUSE PLANTS.

WILLIAM BARNES is commissioned by a private gentleman to offer for sale some of the finest specimens in the country of the following kinds of Greenhouse Plants:—

Azalea delicata	Erica vestita alba
" variegata	Epacris miniata
" Lawrenciana	Pimelea decussata
" Gledstanesi	Pultenæa stipularis
Chorozema angustifolia	Polygala acuminata

Particulars can be obtained by application to
WILLIAM BARNES, Camden Nursery, Camberwell.

WADSON'S SCARLET & OTHER TREE CARNATIONS.

J. WADSON having raised from Seed, and grown as Cut Flowers for Covent Garden several beautiful varieties of the above (which have been so much admired and Plants often asked for), is now prepared to send out the following, viz.:—

Scarlet Brilliance, brightest known ...	3*s.* per pair.
Eliza, bright scarlet flake	5*s.* "
Tom King, rose flake, very large	5*s.* "

The above are three very fine varieties of the Tree Carnation.

Also,

Tree Pink, very fine	1*s.* 6*d.* per pair.
French White Heliotrope...	1*s.* each.

The above may be seen in flower, and Plants obtained of J. WADSON, Florist, near the Thatched House, Albion Road, Hammersmith, for cash only.

The Gardeners' Chronicle.

SATURDAY, AUGUST 25, 1855.

A NOTICE has just appeared in the *Maidstone Journal*, signed by all the leading Hop factors in the borough, which declares that the brewers have sustained most serious losses from the use of the SULPHUR to check the mould in the Hops, and that they shall feel it their duty to demand from the growers a declaration that this practice has not been adopted before they purchase any Hops.

Their manifesto contains the following paragraphs: "It has now been practically ascertained beyond all question that Hops grown under such treatment impart so obnoxious a smell and flavour to the beer brewed from them as to render it unsaleable; and, unhappily, we could multiply instances of losses arising from this cause to the extent of thousands of pounds.

"It would appear that sulphur in moderation applied in vapour during the process of drying produces no deleterious effects; when actually incorporated into the plant by its application during its growth, it impregnates the beer with its flavour to such an extent as to render it undrinkable."

There are one or two statements here which, we think, require some observation. It is quite incorrect, for instance, to state that the sulphur is ever incorporated into the plant by its application during its growth. The application is wholly external, and it is probable that it is the combination of the nascent oxygen due to the mere process of vegetation with the sulphur, that produces sulphurous acid, and so destroys the mildew, and if it were really found that the application of crude sulphur in quantity were injurious to the quality of the Hops, the vapour of sulphur, which consists of sulphurous acid, might be equally efficacious if properly managed.

We, however, beg leave to doubt the justice of the statement of the Hop factors without more distinct data than they have yet thought proper to bring forward. The Hops which are submitted to the vapour of sulphur in the kiln must be impregnated with sulphur to a great extent. So much sulphur is used that a kiln man is as easily recognised at a few yards distance as the unhappy outcast, the ointment of whose hand bewrayeth him. Grapes, though so delicate, treated with sulphur, produce as good wine as those which have received no such dressing, and it is notorious how trifling a circumstance will affect the flavour of the vintage. It must be remembered, too, that a very few Hop growers only used the sulphur, and it seems therefore almost impossible that losses to the extent of thousands of pounds should have been sustained in cases where it is capable of proof that the Hops were derived from gardens in which sulphur was used. The solution of the case is in all probability far more easy. The extremely high price of Hops has induced brewers to use noxious substitutes for Hops, or to buy cheap and damaged foreign samples, and they are now willing to cover such practices, which

could only lead to bad results, by the pretence that the evil has been due to sulphur dredging.

We ourselves bear testimony that foreign Hops have produced ill-flavoured and unwholesome beer in an establishment celebrated in general throughout its neighbourhood for the excellency of its brewing, and we strongly suspect that something of the kind has taken place where the blame has been laid upon the sulphur. At any rate the Hop factors, if they have recourse to such an extreme measure as to refuse to buy Hops without a certificate that they have been grown without sulphur, are bound to give circumstantially the data upon which their manifesto is grounded, and except the names be stated of the several brewers who profess to have suffered, and of the Hop growers from whom they purchased, together with precise figures, capable of verification by any one who has the necessary practical knowledge of the subject, no reliance can be placed upon the manifesto. If the matter is capable of proof, the sooner it is proved the better; but if nothing appears beyond assertion, it is impossible not to suspect a wilful mis-statement of facts somewhere.

The same prejudice which, as we all know, was so long successfully opposed to the general introduction of vaccination, and to so many other important discoveries, will to the end of time be opposed to every suggestion for the relief of any widely spread evil. The general introduction of sulphur dredging or washing in some of its forms would, beyond doubt, have long since saved an infinity of suffering in the wine districts; but a multitude of prejudices in those countries are against anything new, and the public benefactor who proposes them may fall a victim to some accusation of poisoning the people, or of flying in the face of Providence. It is quite certain that sulphur dredging has been a great boon to the Hop grower, and we must make it our business to see that he is not sacrificed either to ignorance or malice. *M. J. B.*

Few things have more perplexed gardeners than the different degree in which the same species of plant has been affected by frost in the same locality. The last two winters have afforded abundant examples of plants destroyed and unharmed in the same garden, or park, or village, under what have been thought to be identical circumstances. Many of these cases have appeared to be so little explicable by differences of temperature, that he who would interpret such phænomena has been obliged in some instances to assume that different individuals of the same species possess different degrees of vitality, which renders some more able than others to resist a low temperature.

We find in the "Revue Horticole" some valuable observations upon this point, by M. Charles Martins, who has very carefully studied as a physicist* the effects of the two last winters at Montpellier. Without denying that the vital power of individuals differs considerably, he has nevertheless sought to explain the phænomena which were presented to him by reference to mere differences in temperature; and we cannot do better than give a concise account of the result of his inquiries.

In the first place he points out the great differences in temperature which are known to occur in places quite contiguous to each other, but which are unsuspected by the ordinary observer. By way of illustration he takes some details supplied by M. Renou from Vendôme in 1852. The valley of Huchingy, about a mile and a half from that place, is 200 yards wide, and bordered by little eminences only 40 yards high. In this place it is always found that the winter temperature, when the wind is in the north, is from 5° to 15° lower than at Vendôme. For instance, Jan. 24, 1852, the temperature at Vendôme was 26°, and at Huchingy at the same hour 21°. Feb. 21, Vendôme, 26°, Huchingy, 19°. March 4, Vendôme, 28½°, Huchingy, 17½°. Finally, on the 20th of April, while the air of Vendôme was 30°, the thermometer fell at Huchingy to 15°. Such differences, he remarks, are the necessary consequence of the laws of heat, and it would be most surprising if they did not exist. An observer of the weather who should announce his having remarked the same temperature in the centre and environs of a town, on the north and south sides of a hill, in a low place and on a height, would gain little credence from those who understand these subjects. Gardeners are most especially those who should appreciate and provide against such differences.

As an example of their effect, M. Martins cites the following instances, which occurred this last spring at Montpellier to the Sweet Bays, Olive trees, and Fig trees. Of these plants some perished while others escaped, and it was here that the effects of aspect and shelter were most conspicuous. In fact, had not the ordinary thermometers shown that the minima of temperature greatly differed, these trees—real living thermometers as sensitive as those of the philosophical instrument maker—would have plainly indicated it.

To begin with the Bay. In a low part of the Botanic Garden, where the temperature was ascertained to have been + 3° on the north side of a wall, and — 1° away from all shelter, the Bays almost all died. But it was different in a part of the garden called the Bosquet de Narcisse, where a swell of the ground raised the surface about 6 yards; here the Bays suffered little; a few were scorched, but the foliage of most of them remained green. At this place the thermometer did not fall lower than + 6½°. Undoubtedly in the Bosquet de Narcisse the Bays were sheltered by high Cypresses and great Celtises; but in a neighbouring garden they suffered very little, although not at all sheltered. Moreover, in the low part of the garden the Bays died, although they were sheltered. In short they escaped wherever there was any rise of the ground. Hence it appears that the difference of a few yards in the level affects temperature so much as to produce entirely different effects upon vegetation. M. Martins remarked, however, that Bays stronger than the rest escaped the frost in the midst of others that died.

It was the same with the Olive trees. In low places where the thermometer fell to — 1° they perished down to the old limbs. In a place protected from the north by a house they only lost their leaves. In all the district between Montpellier and Nismes the Olive trees of the plain suffered more or less, and had to be cut back, while those on the low hills sustained no injury. None of these hills are above 60 yards high and many much lower. There was a pair of young Olive trees (*Olivettes*) planted near each other, but with a difference of elevation between them of 10 yards only; in one the leaves were all scorched, in the other they were scarcely hurt. Many cases of the same kind were observed in other places. These facts appear to establish a general law that "cold is most injurious in low places where radiation is most intense in consequence of the tranquillity of the air, and least injurious in exposed places where the agitation of the air opposes the effects of radiation."

Fig trees and Pomegranates presented the same general results.

Hence M. Martins infers that one of the first duties of a gardener is to make himself acquainted with local climates, the differences among which are far greater than is generally imagined. For example, there occur in the Botanical Garden of Montpellier no fewer than four local climates. 1° *The coldest in winter and hottest in summer;* this is the lowest place unsheltered to the north and west, and only protected to the east by some tall trees. 2° A space to the north of this, protected by houses and walls; *it is not so cold, but as hot as the first.* 3° The Botanical arrangement, sheltered on the north by an Orangery and greenhouse, surrounded by trees and buildings, and overlooked on the south-west by the hill du Peyrou; *this is not so cold in winter, but excessively hot in summer.* 4° The Bosquet de Narcisse and other elevated places; *here the climate is more equable, less cold in winter, less hot in summer.* The mildest place of all is the south slope of a little artificial mound, occupied by evergreen Oaks, Aleppo Pines, Loquats, &c.

These circumstances appear to be deserving of notice, for they show that in addition to the well-known protection afforded by walls and aspects, a very important practical effect is produced by such slight elevations as even a few yards; a point too often very little attended to in forming a garden, and very possibly the cause of some of the apparently conflicting results obtained by those who have recorded the effect of cold upon exotic trees. Most especially are they important as demonstrating the fallacy of thinking that a place is warm in winter because it is low, and cold at the same season because it is high. The defect of M. Martins' observations seems to us to consist in his taking no account of the drainage of the places described by him.

We understand that Sir W. J. Hooker, Dr. Royle, Mr. Bentham, and Mr. Wentworth Dilke, the four Fellows of the Horticultural Society of London who a short time since formed a deputation to the Imperial and Central Society of Horticulture in Paris, have been elected corresponding members of the latter body. The Council of the London Society have ordered a similar compliment to be paid to our French Horticultural friends as soon as the formalities required by the English charter can be complied with after the autumnal recess.

* This word has been lately proposed as the English form of the French word *physicien*, and we willingly adopt it.

New Plants.

139. Lilium napalense. *D. Don. Wallich Plant. as. rar.*, iii. t. 291.

A small single-flowered bulb, with alternate lanceolate leaves. Flower nodding, with revolute smooth segments as long as the tube. Stamens shorter than the flower, with deep orange-coloured pollen. According to Dr. Wallich the flowers are dull yellow; in the specimen before us they are greenish, much speckled with purple inside. It is from a very weak bulb presented to the Horticultural Society by the East India Company, and which opened on the 16th July, that this note has been made. The Indian drawings represent the flower to be 5 inches long, and this corresponds with Dr. Wallich's account and our wild specimens. As soon as it gets into health, it will no doubt become a valuable addition to our hardy Lilies. It never seems to grow more than 2 or 3 feet high. Odour it has none worth mentioning.

140. Strophanthus capensis. *Alph. De Cand. Prod.* viii. 419. Christya speciosa. *Ward and Harvey in Hook. Journ. Bot.*, iv. 134, t. 21.

A greenhouse shrub, with obovate convex verticillate leaves, and short dichotomous panicles of flowers. The corolla is funnel-shaped, with five long narrow bluntish yellow lobes marked with deep orange at the base, where also, namely at the orifice of the tube, are 10 small acuminate teeth standing in pairs. It has flowered in a glass wall in the garden of the Horticultural Society, where it was received from Messrs. Backhouse. In what respect this plant can have been supposed to differ from *Strophanthus* we are unable to discover. The stigma is cylindrical as in that genus, and by no means of the form represented in the Journal of Botany. In every particular it, in fact, agrees with the description of *S. capensis*, a plant we have not seen, except in the number of its leaves being usually four, not three, in a whorl, and in its corolla-teeth being acute, not blunt; differences which are probably unimportant, even if real. The calycine scales are exactly such as Prof. Alph. De Candolle assigns to his plant.

VEGETABLE PATHOLOGY.—No. LXXXV.

354. Phylloptosis, Carpoptosis, Anthoptosis (*Fall of the Leaf, Fruit, Flower*).—When organs have fulfilled their functions it is natural that decay should commence, and necessary, if the organism is to continue in life and to repeat the same cycle of functions, that the effete organs should make way for others. Organs so abundant, and in general so indispensable as leaves, which answer not only the purpose of lungs but promote other material processes, could not remain long on the tree after they have performed their functions without inconvenience, and their fall renews in some measure the waste of the soil due to the absorption of its nutritious matter by the spongelets. In some cases their fall is a slow process; there being no provision by which separation can naturally take place, the lamina remains attached to the stalk till it is torn into strips by the wind, and ultimately dries or rots off. Where there is no articulation, as in the Melon,* their decay is a fruitful source of mischief, insomuch that it is often advisable in those cases where it is absolutely necessary to thin the foliage for the sake of procuring a freer circulation of air and transmission of light, to leave a small portion of the lamina upon the petiole, as decay in such a case takes place far less rapidly.

355. In many cases, however, the fall takes place by a tolerably clean section passing through the cellular tissues and the inclosed vascular bundles. The leaf gradually loses its natural hue, assuming yellowish or reddish tints from a chemical change in the chlorophyll; the tissues dry up and refuse to perform their functions any longer, the sap ceases to flow and return by its accustomed channels, till at length the cells which still retain their vitality and those which are effete are in contact; separation takes place, and the organ falls. Now there is no process of inflammation, so far at least as we can ascertain, by which the new and old tissues are separated, as in the limb of some animal, a portion of which has been injured, and has in consequence passed into a state of mortification. The progress of decay goes just so far as to be capable of affecting the adjacent vital organs only, and as there was already some peculiarity of structure by which the organ seemed to possess an articulating process, the dead and living tissues part at that point. It is asserted by Schacht that the cells at the plane of separation are cork cells, and that the scar is subsequently covered with them, but this requires confirmation. He speaks positively indeed of having ascertained in Dracæna reflexa the presence of tabular cells resembling perfectly in form and character the cork cells of the bark, perforated by the vascular bundles, and where the blade of the leaf is withered, perfectly resembling true cork cells in chemical composition. The transmission of sap is consequently impeded, and at length entirely cut off, insomuch that the leaf hangs loose upon the stem and finally falls. I have in vain endeavoured to confirm Dr. Schacht's views, which I am inclined to think are much impaired by other analogous cases, as the separation of branches of different sizes from trunks, which will be mentioned in a following article. And any change which may take place in the superficial cells of the scar with a view to

* Sometimes, as in the Potato, the diseased leaf or leaflet is thrown off at the base, and the decay does not extend, but not so frequently the dead leaf hangs upon the stem which becomes rapidly affected, and within a few days the whole haulm perishes.

protect the subjacent tissue from the effect of the weather in the absence of cuticle may be entirely independent of the phenomenon in question. It is possible indeed that some such transformation may take place with a view to cut off the transmission of any morbid matter from the dead leaf to the living tissues. That disease does take place occasionally from such transmission I have traced clearly in the case of canker, and there is no reason why this should not be the case, exactly as pus absorbed into the animal frame from ulcers is frequently as fatal as if direct inoculation from another subject had taken place. And if these views be true, the formation of the cork cells may be a consequence of the effete state of the leaves, which might equally have fallen had no such cells been formed. The whole matter is, however, at present quite conjectural. Certain it is that such separation does take place sometimes where there is no appearance of a suture. The fall of fruit, flowers, anthers, &c., from its point of attachment belongs to precisely the same set of phenomena as the fall of the leaf, though there is merely a cessation of active growth and not of the functions of the cells which are as active as ever in some respects, or the fruit would in many instances never arrive at perfection, but there is the weight of the fruit in one case in addition to assist the operation. The separation of seeds from their placenta is not exactly parallel with either, though more analogous to the last. The component parts have all arrived at perfection, and therefore neither require any more nutriment from the mother plant, nor are in a condition to make any further interchange, and, as in the two former cases, separation takes place. We must then, on the whole, regard this separation as a vital process; and if we consider that leaves and fruit do not in general fall from a branch killed by abrupt separation, we shall be the more inclined to adopt some such view. *M. J. B.*

THE CROP OF PEARS IN THE SOUTH OF ENGLAND.

At last the spring frosts have spared us, and our Pear trees without being subjected to any new system of pruning are laden with fruit—a great contrast to last season, when scarcely a Pear could be seen on standard or dwarf trees not trained to walls; and yet the blossoms last spring were not so finely developed as in 1854, the weather previous to the 24th of April having been so dry and warm that I scarcely ever remember the blossoms of fruit trees to have been so perfect and beautiful as then.

I have a plantation of 2000 trees of the Louise Bonne of Jersey Pear. On the 24th of April, 1854, the fruit had all set vigorously and beautifully, and were about the size of small Acorns; on the morning of the 25th the thermometer stood at 25°, and scarcely one escaped, for all were frozen through to the core and dropped off. The spring of 1855 was, as must be well recollected, very cold; severe frosts all through April, and May commencing with the same winterly weather, for on May 3d we had 12° of frost (our December frosts are rarely more severe); on May 5th, 8° of frost, and on the morning of the 9th 11°. The weather all this time was dry, and the blossoms of the Pear trees unexpanded. On May 20th my Louise Bonne Pear trees were in full bloom, and I then found a few blossoms on the outside of each cluster injured, but the greater portion were perfect; the weather continued dry, and they set their fruit well. I have now a crop such as is rarely seen, the fruit of a clear red, without spot or crack; two rows (150 trees) of the Beurré d'Amanlis are equally beautiful, all studded with clear waxy-looking fruit, seeming as if they had been placed on the trees by the hand of an experienced gardener, so regular and beautiful are they. These trees are all pyramids and bushes on the Quince stock; the soil is a sandy loam inclining to clay for about 15 inches in depth, under which is a stratum of brownish white clay, with numerous chalk stones, and then calcareous sand, so that the soil is cool and moist, yet well drained. To the calcareous nature of the soil (which without manure gives a yellow tint to the foliage) I imputed the brilliant colour of the fruit, excelling both in flavour and appearance any Pears of the same kind imported from France or Jersey.

In connection with the Quince stock I may mention a curious fact. The Louis Bonne Pear, grafted on the Pear stock, after growing vigorously some four or five years on the soil as described above, begins to canker and rarely gives a fruit free from spots. A few days since, observing one or two trees in my plantation without fruit, I was induced to examined them, and I found that, owing to their being planted too deeply, they had struck root from the Pear at its junction with the stock; these roots, instead of being fibrous, and keeping near the surface, like those of the Quince, are large, and have struck deeply into the subsoil; the consequence is barrenness, and a tendency to canker, for the branches are full of cankery spots: whereas, all those growing on the Quince stock, although differing to a great extent in vigour, have not a spot of canker on them. In two rows of the Beurré d'Aremberg of 150 trees, budded on the Quince stock and laden with fruit, I observed one tree showing most vigorous growth, being double the height of the others; on taking a close view I found not a single fruit upon it; this tree is on the Pear stock, and its roots having apparently struck deeply into the subsoil, have thus lost the influence of run-heat and the consequence is sterility. This simple fact seems to me to tell us how imperative it is to keep the roots of our fruit trees near the surface, and thus to let them have that ripening warmth so necessary to the fruitfulness of the tree. I saw this further exemplified so recently that it is perhaps worth mentioning. A friend having read in some recent publication that orchard-house trees in pots should always be plunged, had all his pots plunged to their rims in early spring. The consequence is that his Peach and Nectarine trees have become quite unhealthy and the fruit is dropping off without ripening. The roots of Peaches and Nectarines benefit largely by the pots being surrounded by the warm air of the house. *T. Rivers.*

RHEUM NOBILE.

"The present is certainly the most striking of the many fine Alpine plants of Sikkim; and though in every botanical character, as also in the acid juice of the stem, a genuine Rhubarb, it differs so remarkably in habit and general appearance from any of its congeners, that at first sight it could not be recognised as one of them. I first saw it from a distance of fully a mile, dotting the black cliffs of the Lachen Valley at 14,000 feet elevation, in inaccessible situations, and was quite at a loss to conceive what it could be; nor was it till I had turned back the curious bracteal leaves and examined the flowers, that I was persuaded of its being a true Rhubarb.

"The individual plants of Rheum nobile are upwards of a yard high, and form conical towers of the most delicate straw-coloured, shining, semi-transparent, concave, imbricating bracts, the upper of which have pink edges; the large, bright, glossy, shining, green, radical leaves, with red petioles and nerves, forming a broad base to the whole. On turning up the bracts the beautiful membranous, fragile, pink stipules are seen like red silver-paper, and within these again the short-

branched panicles of insignificant green flowers. The root is very long, often many feet, and winds amongst the rocks; it is as thick as the arm, and bright yellow inside. After flowering, the stem lengthens, the bracts separate one from another, become coarse red-brown, withered and torn; finally, as the fruit ripens they fall away, leaving a ragged looking stem covered with panicles of deep brown pendulous fruits. In the winter these naked black stems, projecting from the beetling cliffs or towering above the snow, are in dismal keeping with the surrounding desolation of that season."

Such is Dr. Hooker's account of this curious Rhubarb, of which the accompanying sketch is taken from his recent work on Himalayan plants (see p. 515). The natives call its stems "chuka," and eat them, their acidity being pleasant. Some of the seeds which were sent to Kew grew, and the seedlings lived two years; but we regret to learn that they have now been lost. Let us hope that the plant will be reintroduced with more success.

Home Correspondence.

Why should not Part of an Extensive Pleasure Ground be Appropriated as a Winter Garden?—Not merely a few evergreens planted amongst deciduous trees and shrubs, but such a winter garden as existed in Kensington Gardens nearly seventy years ago. There was then a pavilion open to the south; in front a broad gravel walk, which also surrounded a smooth shorn green, and thus the sun's rays were not obstructed in their passage to the pavilion. Excepting the part it occupied was a shrubbery of evergreens beyond the gravel walk; cold winds were kept off by Pines and Firs; the sombre hue of these trees was relieved in front of them by the bright green of the Laurel, and by the admixture of variegated evergreens, together with the gay Holly and its bright berries. Towards the walk were Heaths, and near the Box edging Christmas Roses, Snowdrops, and Crocusses. In 1829 I sought the winter garden, but not a vestige of it remained save a few Firs and Pines; deciduous shrubs had grown up amongst these trees, thus banishing the charm of the former winter garden where nought but verdure presented itself. The vast variety of evergreens now cultivated would enable a gardener of the present day to vary greatly the appearance of such a spot. It may, indeed, be said against a winter garden that it would at times be covered with snow, but snow is not on the ground during the four, five, or more months of our ordinary winter. A winter garden need not prevent those who like a long walk from taking it, but such a sheltered, cozy, green garden would be a cheerful retreat for persons advanced in years, and for those who most enjoy a book when read in the open air. *B.*

Sir Harry Strawberry.—Never before have such pains been taken to introduce a new Strawberry to the gardening world as have been taken with this. It will now, therefore, be very interesting to learn from your correspondents whether or no its qualities are at all equal to its high-sounding descriptions. Is it larger, hardier, and of higher flavour than the British Queen? Has it been exhibited in London at any of the great exhibitions? It was shown at Carlisle in July last, and not thought highly of. It was also shown at Watford, July the 16th, and obtained the third prize, its flavour being poor and flat. *Fragaria.*

Transplanting Large Trees at Gunnersbury Park.—In the report of Gunnersbury Park last week, I see I stand sponsor for the Douglas Fir, "45 feet in height; since it has been transplanted it has pushed a little, but its top appears to be dead." So much for Mr. Barron and his mode of transplanting large trees. It is not for me to say whether this report be carelessly or unfairly written, but in either case allow me to put the matter right. The majority of the large trees transplanted at Gunnersbury in October last were removed by my machines, under the superintendence of one of my men, all of which are doing well, with one exception, viz., the large Douglas Fir. This tree was removed under my own superintendence; but before I was applied to to remove it, a trench had been cut quite round it, severing every root very much too near, upon Sir Henry Stewart's principle, and totally at variance with my plan of transplanting. I stated distinctly to Baron de Rothschild and Mr. Forsyth at the time, that with the roots in such a state it could not survive unless protected by an awning, and careful top watering. This was carried out, and notwithstanding such a severe winter and spring the tree lives. The dead top is the result of having its toes too closely pared. This system I protest against. Much has appeared in your Paper within the last three years on the subject of transplanting large trees. Little more than two years ago it was stated that a new system then in vogue would "supersede every other," and the writer of those articles racked his brain to find subjects of comparison to set off this favourite system. Planters ancient and modern were placed in juxtaposition, but luckily the writer forgot that either Elvaston Castle or Mr. Barron were in existence, notwithstanding all that had appeared in the *Chronicle* but a short time before. I remained quiet. Nevertheless some made honourable mention of what had been done; amongst others Sir Joseph Paxton told Dr. Lindley that "Mr. Barron's system was still the best for removing large trees." Since then I have transplanted in Kent, Sussex, Berkshire, Hampshire, and Staffordshire most successfully several hundreds from 25 to upwards of 50 feet high; and on 4th of July last, on my last built machine, at Elvaston Castle, in the presence of thousands of people, I removed an Oak 46 feet 7 inches high, and not a leaf flagged. It is now doing well. *J. Barron, Elvaston.* [We do not know what our correspondent complains of. Not a word was said or implied in disparagement of Mr. Barron's skill in transplanting large trees.]

Potato Disease.—When I wrote to you last week, I said "no Potato disease." On the Friday, however, of last week, it made its appearance in force; and in accordance with the plan always successfully pursued by me, I mowed off the tops at once, and I do not fear having a crop of healthy Potatoes; more especially as the disease appeared this year fully a month later than usual, which is about the time all vegetation has been protracted in its growth this year by the cold winter and spring. Does not this show most unmistakably that this singular disease is connected with a peculiar period in the growth of the Potato plant? If the cause is electrical or atmospherical, still it only produces mischief at this particular point. It would be interesting if a number of your readers would record each year the date of the first day upon which they observed the invasion of the disease. *C. R. Bree, Strickland, Stowmarket, August* 22.—— The disease commenced in this neighbourhood with the late rains, and increased with a rapidity I never before witnessed. The stench emitted from the allotment field

gardens, belonging to Melville Portal, Esq., M.P., consisting of about 10 acres, was almost intolerable. Having had an opportunity of visiting several adjacent villages, I observed that the haulm of the early Potato was completely scorched, while that of the later sorts is considerably damaged. On examining a root of the Fluke Kidney the other day it yielded ten fine tubers, neither of which exhibited the least signs of decay, although the leaves were diseased. On lifting a root of Yorkshire Kidneys in a contiguous bed, I found two out of three of the tubers diseased and unfit for use. Should the present dry weather continue, the decayed leaves may cease to generate a parasitical fungus, and a plentiful crop may yet be realised. Should wet weather, or a humid atmosphere return, I fear that the lately promising crops of Potatoes, as well as the hopes of the growers, will be blasted. *C. Taylor, Whitchurch, Hants.* ——Within the last fortnight the Potato crops in this neighbourhood have become unmistakably affected—the disease diffusing itself with alarming rapidity. It appeared here simultaneously with mildew, which attacked some of my crops of Peas, and so far as I have been enable to observe its nature and apparent progress on the affected plants, I feel disposed to conclude that it is a fungus analogous to the mildew which is so destructive to Vines, wall trees, Peas, &c; but it appears to me that owing to the succulent nature of the Potato, its pernicious property is imbibed and conveyed into its whole system far more instantaneously than in the case of hard-wooded plants; hence the rapid changes which so soon take place after the watery tissues of the Potato are attacked; and I think it may and has been observed that the nearer the plant approaches maturity the more certain is its safety. If that be so we cannot do better than follow the advice from time to time given in your Paper, viz., to plant early so as to be able to lift the crops before the disease is likely to make an inroad amongst them. If taken up free from disease and stored in as dry a state as possible out of the reach of atmospheric influence, they may be considered perfectly safe. I have found it an excellent plan to keep by me a lot of dry mould in sheds (and air-slaked lime) such as old potting soil, &c.; this I sprinkle amongst the Potatoes as they are laid by, and likewise cover them with it to the depth of an inch or two. By adopting this plan I find that they keep much better, being in a more uniform state, and the air—humid or otherwise—is, as it were, more perfectly excluded. I took up some Potatoes about a week or 10 days ago which were housed, with the exception of the smaller ones, which I intended for seed. These were spread thinly on an exposed surface, and on examination to-day they were found to be very much diseased, while the others are perfectly free. Thus I consider the malady to result from the peculiar state of the atmosphere which we have experienced of late. *Geo. Fry, Lee, Kent.*

Hedges.—In the winter of 1849 extensive alterations were made here, and quantities of Quick hedges were planted in double rows. I gave 4*s.* per thousand for the Quick. Immediately it was planted I had it all cut to within 4 inches of the ground, and such has been the progress of these Quickset hedges that they are now 4 feet 6 inches high and 3 feet through at the ground, without a gap. A portion of one of these fences will have to be moved this autumn. How am I to proceed? *J. M.* [Take them up in September, and cut them down to within a foot of the ground.]

Hedge Knives.—Your correspondent, "A Yorkshireman," has made a mistake in the name of the best hedge-knife maker in Scotland. It is Mr. Sanderson, of Dunse, Berwickshire (not Harrison). His No. 70 is very good for switching where the hedges are trimmed twice a year; but I always preferred the No. 80 for switching, whether the hedges are trimmed once or twice. No. 90 is a useful implement for breasting (cutting large hedges over), but hedge-hooks of all sizes can be had from Mr. Sanderson. His hooks are also supplied by all the principal nurserymen in Scotland; but I would recommend nurserymen and others who supply Sanderson's hooks to have them handled the same length as those supplied by Messrs. E. Lang & Sons, Nurserymen, &c., Kirkaldy, Fife, N.B. They are 4 inches, or perhaps a little more, shorter in the handle than those in general use. *A. S., Horningsham.*

How to Cut Hedges.—In reply to "A Yorkshireman," who says the hedges in his district are not clipped square, I beg to state that only the north of Ireland was referred to in the observations made by me. *A Northern.*

Camellias. — Having observed that "C. P. W., of Penzance," is wishful to know how to bloom Camellias with success, I send the following from an experienced gardener:—How to set Camellias with or without artificial heat. When the growth is nearly made, that is, when the leaves have expanded in the young shoots, water should be withheld so as to allow the plants to flag but not shrivel. This should be repeated twice, after the first flagging water them copiously, filling the pot three or four times after the water has sunk; only water them this once, then let them flag as before; care is required not to allow them to flag too long or the leaves will be injured. This sudden check at that period I have always found will cause the plants to form buds, but unless they are in health this process to set them for flower will be useless, as it would weaken them still more. I have been enabled by these means to cause Camellias to bloom that have not flowered for three or four years. *Bella Donna.*

Bees v. Fruit.—I have found bees so destructive to fruit that I have long since given up keeping them myself. My neighbours' bees are now attacking my Gooseberries and Raspberries, and will doubtless make sad havoc with a fine crop of wall fruit. There is no help for this, but I should be glad to know whether in other localities bees are so mischievous. *Henry.*

How to make Yeast.—Your correspondent "W. B." complains (see p. 502) of the difficulty and expense of procuring yeast for baking, and also of the bitterness of that generally had from the brewer. In order to obviate the many difficulties mentioned by "W. B.," allow me to suggest the propriety of his becoming his own manufacturer, so that (after the first time) he may be quite independent either of the English brewer or German distiller. The accompanying formula is much used in Monmouthshire, and from my own experience efficient. I may add that the term yeast is scarcely known in that locality, but that it is universally known by the name of Barm. To make the latter, boil 1 ounce of Hops in rather more than 2 quarts of water during one hour. Strain; if less than 2 quarts make up the measure by straining more water through the Hops. Add one table-spoonful of salt. Mix together intimately ½ lb. of fine flour and ¼ lb. of brown sugar. When the Hop liquor is rather more than milk warm, stir the mixed flour and sugar into it, and at the same time a teacupful of good yeast. Put the mixture into a covered jar in a tolerably warm place (the hob of the grate) stirring frequently during 24 hours, when it will be fit for use. Keep it in a stone bottle in a cool place not too tightly corked. It will keep good for three months. It is necessary to stir and shake before use. *C. Clifton, Bristol.*

Page and Co.'s Blight Composition.—In my experiments with this mixture, I have found it to kill red spider with as much facility as it does aphides, and mealy bug as effectually as thrips or scale, and all with one syringing. I have tried it upon Hop-bines, and with one syringing it has completely cleansed them from lice and fly. When better known, it will therefore, doubtless, be extensively used by Hop growers as well as by gardeners, for mealy bug and scale. I take a large pan and lay the head of the plant in it, playing upon it with all the force I can with a syringe. The pan prevents waste, and I can use the same composition on the plants two or three times. This mode of applying it is therefore very economical. *Henry Barham, Springfield Nursery, Hastings.*

Discovery of Red Crag at Comb, near Stowmarket.—Your geological readers will feel interested in the fact that the red crag has been found 12 miles further inward than has hitherto been recorded. Some shells, and ferruginous shelly sand in which they were found, were sent to me a few days ago. The bed was discovered while deepening a well at the malting of Mr. Webb, close by the turnpike-road, near the bridge, leading to Stowmarket. I at once recognised them as belonging to the red crag, and my opinion was confirmed by Professor Henslow, to whom I sent a shell and some of the sand. This morning I found a phosphatic nodule, commonly called coprolite, among the sand. Unfortunately the well was closed before I heard of the circumstance. The men say it was deep and full of shells, and filled with water. It is below, considerably, the bed of the river, which runs through the premises. *C. R. Bree, Strickland, Stowmarket, Aug.* 22.

Gooseberry Caterpillar.—The Gooseberry leaves furnished by "T." exhibit two distinct kinds of objects on their under surface. The small semi-transparent oval bodies placed along the chief ribs of the leaves are the eggs of the Gooseberry grub. There are about 20 on one leaf alone. This will, I apprehend, fully answer "[illegible]'s" observations in last week's *Gardeners' Chronicle.* The other objects are minute vegetable excrescences, probably arising from wounds made by insects sucking the leaves. *J. O. Westwood.*——White Hellebore powder is by far the most efficacious remedy for this pest I have met with, and is of easy application, whereas syringing, removing the surface soil, or repeated dusting of soot &c., over the bushes would be exceedingly troublesome on a large scale. I have had two attacks this season, but have sustained very slight damage, not more than 1 bush in 100 being seriously injured. Early in the season we captured and destroyed the flies before breakfast; since that we have trusted to Hellebore alone, and friends who have adopted this treatment at my suggestion report its perfect success. *R. Varden, Seaford Grange, near Pershore.*

American Aloes. — In the year 1842 I furnished an account of the different plants of American Aloe that from time to time had flowered in the open air at Salcombe, near Kingsbridge, South Devon, which was published in the 44th number of your Journal for that year. I have now the pleasure of stating that, in different gardens in that favoured locality, four plants are rapidly coming into bloom which have never received protection of any kind. The first is at "The Molt," the marine seat of Lord Courtenay, and the summer residence of Lord Justice Turner. This plant displayed, early in July, a faint and almost doubtful symptom of blooming, yet the flower stem is now (Aug. 13) 18 feet high. The two next are situated in a small garden belonging to Henry Strong, Esq., a gentleman resident in the village of Salcombe, who with industry and taste has formed a pleasurable retreat in the wild, overhanging sea cliff; there, surrounded by the tangled brushwood, many tender plants luxuriate. Among them rise the lofty stems of the Aloes, one of which was planted about 30 years ago; the other 27. Their growth has averaged 5 or 6 inches in 24 hours, and they are now about 23 feet high, with the prospect of attaining 3 or 4 feet more. The fourth is in the garden of Cliff House, the residence of Mrs. Prideaux, and has been planted within the last 20 years: it grows on an esplanade a few feet above high-water mark, and, with many others, is conspicuous for its luxuriance, which is seemingly produced by its close proximity to the sea. I believe Salcombe is almost the only spot in England where the Agave Americana has flowered in the open air, and certainly it has no rival in producing four blooming plants in one season. Whether the late rigorous winter, in concentrating the sap, has produced the flowering results, I leave to botanical physiologists to determine. *A Devonian.*——I have an American Aloe in my garden that has been exposed without any shelter during these last 14 or 15 winters. It was an offset from an Aloe which, I apprehend, flowered at Salcombe, and it is now about 40 years old. Its height from the ground is 4 feet 6 inches; this likewise is the length of most of the larger leaves, one being 5 feet. The plant has far less grandeur and symmetry than when grown under shelter, as the lower leaves decay annually, and many get bruised or broken by the wind. Nearly all the numerous suckers from the roots were killed last winter. About five years since it was thought to show signs of flowering, but having little care bestowed on it, this was not realised. Ten or 12 years ago it was transplanted, and its roots completely disturbed, the weight being otherwise more than four or five men could readily command. The pit destined to receive it was filled nearly to the surface with rubble, and a brick wall raised about 16 inches, with apertures in the sides to allow of complete drainage. The soil in which it was planted was garden earth, with a large proportion of Jersey sand. The plant is now for the second time much out of the perpendicular, as we see it frequently pictured in views of the tropics, probably from the effect of the wind, and the slight holding of its roots. *L. P., Plymouth.* ——Permit me to say, in answer to "Vectis, Carisbrook," that the American Aloe which stood out last winter without covering is a sucker springing from the old plant that blossomed in the open air in the year 1847, and which was reported in your columns. The original plant was brought into Wales above 90 years ago, where it remained for 45 or 50 years under glass, but from its being large and cumbersome to place in a new range, it was laid in its tub in a warm south border of the kitchen garden, and was never covered, and to the surprise of many (as stated) it flowered, throwing up two stems 12 and 10 feet high. *Anon., Rhyl, August* 22.

Flowers of the Crimea.—We have a number of very beautiful plants here, and their profusion in rapid succession grouped in masses is very striking. I have seen at least 100 acres of Larkspurs and Poppies mixed, the Larkspurs 5 feet high; acres of yellow Centaurea; two or three sorts of Boragineæ, especially a beautiful *Echium.* But none of these equal the carpet of Crocuses in the spring. I have already found 42 species of Gramineæ, many of them peculiar species, with some few wandering Indian ones. A species of *Secale* is common, and so is that remarkable *Phalaris bulbosa*, which has always bulb-like excrescences in whatever soil it may grow. *Triticum villosum, monococcum*, and *cristatum* are all very beautiful species. The Composites are very pretty; one, an everlasting, has so much flower and so little leaf that it ought to be a very desirable plant to cultivate. I enclose a flower. *W. M., before Sebastopol, Aug.* 3. [The flower referred to is Xeranthemum radiatum.]

Honey Dew.—Justus Liebig says that certain diseases of trees, as the so called honey-dew, are evidently produced by a disproportion in the azotised and non-azotised matters which act as the food of plants. It would reward the labour to put this view to the test of experiment, and I believe the result would be in favour of it against the prevailing notion that honey-dew is derived from aphides. *Quæstor.*

Societies.

Entomological *Aug.* 6.—J. Curtis, Esq., F.L.S., in the chair. Amongst the numerous donations announced as having been received since the last meeting was an extensive collection of Indian insects presented by Major Hamilton, containing many rare and very beautiful species of all orders; also various rare species of British carabidæ by the Rev. Hamlet Clark. The secretary gave notice that a requisition had been presented to the President and the Council with a view to settling the disputed question regulating the admission of Associates. M. Pectet, of Geneva, was elected one of the honorary foreign members in the stead of the late Dr. De Haan, of Leyden. The secretary also announced that a new part of the Transactions of the Society was ready for distribution, containing, in addition to several memoirs descriptive of new species of various orders, a continuation of Mr. Desborough's researches on the history of the Honey Bee. Dr. Power exhibited various Coleoptera recently captured in the New Forest, including the very rare Agrilus chryseis, Anthaxia nitidula, Drypta emarginata, &c. Mr. Douglas exhibited a specimen of Trochilium chrysidiforme taken near Dover on the 25th June, thus proving that this species, which had been doubted by some writers as British, is a genuine native of this country; another specimen has also occurred during the present summer. He also exhibited various rare Microlepidoptera recently captured in Kent; Mr. James Dutton a number of rare species from the Isle of Wight; and Mr. F. Bond others from the fens of Cambridgeshire. A specimen of the

rare Cryptocephalus nitens from Cobham, Kent, was exhibited by Dr. Baly; and by Mr. H. Doubleday specimens of two distinct species of Noctuidæ, generally confounded in collections under the name of Caradrina blanda. Other rare species of Lepidoptera were exhibited by Messrs. Weir, S. Stevens, and Foxcroft. Mr. Westwood exhibited a living scorpion, imported from Mexico, among plants by the Horticultural Society. Also specimens of the eggs and living larvæ of the dog flea, the former of which are deposited singly and loosely by the females: specimens of the latter, as well as of the living insect in the perfect state, had recently been communicated by him to Mr. Halliday, and the result of this examination he believed would tend to prove the propriety of regarding Pulex as the type of a distinct order and not as portion of the Diptera. He also exhibited specimens of the perfect silk moths, recently under cultivation in Malta, received from Dr. Templeton, where it has unfortunately been found impracticable to rear the insects successfully. Specimens of the true Saturnia Cynthia, which produces the Eria silk of India, received from Major Jenkins, were also exhibited by Mr. Westwood, who considered, from analogy with other domesticated insects and other animals, that there were not sufficient grounds for considering the Malta specimens as distinct from the Indian ones, contrary to the opinion of Dr. Boisduval, who had described the former under the name of Saturnia Ricini. A discussion took place on the great number of moths which, notwithstanding the long hard winter, have appeared during the present summer, during which Mr. Westwood stated that he had observed these insects to be attracted in vast numbers to the saccharine secretion left by aphides on the leaves and stalks of Beans, and also to Gooseberries which have been cracked by the rain.

Botanical of Edinburgh, *July*.—This meeting was chiefly occupied with a report upon the results of Professor Balfour's late excursion with the botanical pupils of the University of Edinburgh. We can only find room for the following record of localities for rare plants:—Diatomella Balfouriana, Bracklin Bridge; Littorella lacustris, near Lead-burn; Galium uliginosum, near Lead-burn; Jungermannia decipiens, Wilson, near Ardglass; Eorrera flavicans, Ach., on Ardglass Downs; Rubus Chamæmorus, Hill South of Habbie's Howe; Potamogeton prælongus, Kinghorn Loch; Eriophorum latifolium, near Crichton Castle; Saxifraga oppositifolia, Allermuir Burn, Pentlands; Lactuca muralis, near Musselburgh; Silene anglica, side of Peebles Railway; Tulipa sylvestris, near Ravelrig, Donibristle, near Aberdour; Valeriana dioica, Marsh at foot of Middle Eildon Hill, Melrose; Crepisbiennis, field at Luffness; Campanula Trachelium, Luffness; Lathræa squamaria, woods near Melrose; Neottia Nidus-avis, woods near Melrose, near Ayton Castle; Carex incurva, near Longniddry; Carex Œderi (true form), Gullane Links; Asplenium germanicum, Minto Crags, near Hassendean; Lycopodium alpinum, near Tynehead; Grimmia deusta, Eildon Hills; Sticta scrobiculata, near Melrose; Calicium furfuraceum, ground in a plantation at Bonaly; Gyrophora polyphylla, Arthur's Seat; Gyrophora proboscidea, stones on the top of Carnethie; Bryum atropurpureum, experimental garden (G. Lawson); Closterium Lunula, road behind Edinburgh Academy (G. Lawson); Campanula latifolia, Eaglescairnie Woods, Craigcrook; Cypripedium Calceolus, Arncliffe, Craven.

Dr. A. Douglas Maclagan exhibited specimens of plants received by him from the Crimea, among which were the following: Convolvulus cantabrica; Paronychia serpyllifolia; Salvia Horminum; Sideritis sp.; Onobrychis petræa; Lathyrus tuberosus; Helianthemum vulgare; Linum hirsutum, L.; Adonis æstivalis, L.; Myosotis sp.

Notices of Books.

Chloris Andina. Essai d'une flore de la région alpine des Cordillères de l'Amérique du Sud. By H. A. Weddell, M.D. 4to. Paris: Bertrand. To be published in 16 parts, at 12f. 50c. each part.

The Alpine Flora of Peru and Bolivia is full of interest, and no traveller has gained more accurate information respecting it than Dr. Weddell, a distinguished botanist, of whose interesting travels in the Cordilleras we have on two former occasions given some account (1845, p 632, and 1850, p. 55). The copious materials obtained in those voyages form the basis of the present work, which is however augmented with the discoveries of other travellers. The plates are executed by M. Riocreux, an artist of great botanical skill.

The part before us contains Composite plants exclusively, of that singular bilabiate race which is so characteristic of western South America. The specific characters are in Latin, the descriptions in French; the arrangement adopted is that proposed by the late lamented Adrien de Jussieu, in which monopetalous orders are to take precedence of all others.

Garden Memoranda.

Visit to the Crystal Palace.—The progress made in the establishment generally during the past season has been, for the magnitude of the place, very satisfactory. Portions of the ground became developed that on my last visit were chaotic, and the trees and shrubs already assume a character. The general keeping is excellent, and time alone is required to develope beauties now in embryo.

At this visit I saw the display of water works for the first time. I was in the building the first part, and afterwards on the upper terrace, and finally on the level of the fountains. From above the space was so vast that the water was anything but effective—there did not appear enough in quantity, nor was its range sufficiently high. At each stage on my descent these defects became less apparent, and I came to the conclusion that when those farthest from the eye are in work, what failed to satisfy will then fill up the interstices, and also attain an altitude that will leave nothing to desire. As it is I could have waited longer, so as to have seen them for the first time in perfection, and I doubt not that thousands have had a similar feeling. Many persons expressed opinions in favour of St. Cloud and Versailles, and in one sense they were right (as now seen), for the quantity of water is in either of these two celebrated gardens more in proportion to the space than that at the Crystal Palace. At those places the trees are grown up, and confine the eye to such limits as show off the waters as occupying the entirety of the middle ground. Whenever the time arrives that our trees have obtained their growth, and when also the lower fountains and cascades are in full activity, I venture to predict that the water works at the Crystal Palace will take rank far beyond their celebrated rivals. Give only time for the noble forms of the Deodars and Araucarias to develope themselves repeating their effects "each beyond each," and they will combine with the grand architecture and water in a manner that hitherto no eye—save those of the poet, the painter, and the landscape gardener—can have seen.

Arrived at the geological illustrations I found the inimitable Hawkins, to whom so much is due for the restoring the forms, texture, nay very expression of the animals that peopled this world at its earlier periods, and when the skill of the Infinite produced creatures for the then circumstances, although of magnitudes and kinds that seem to us most strange. I found Hawkins in deep study over some three or four hundred pieces of Portland stone that had once been an exogenous tree. It was found prostrate, and had every piece of it been marked, it could have been put together without difficulty, and would have formed an object of great interest, as proving that, although surrounded by endogens, mostly Cycas gigantea, yet that trees like our Oaks and Elms did then also, as now, clothe the earth. Upon looking over the fragments, the annular layers of growth, the axis, a branch, and also that part where the branch is given off from the trunk, as well as a suppressed branch, were all perfectly distinguishable. If Dr. Lindley could find time he would be enabled to arrange the disjecta membra.

The geological portion of the ground at present is the least finished. The animals have been transferred from the studio in considerable numbers, and have been placed in groups with great skill; but until the water is introduced in greater volume, and also the ground "licked more together," as the artists' phrase is, we cannot expect a oneness of effect. Where things vast and strange arrest the eye on all hands, it is difficult to speak of one; but there is a thing of beauty, so exquisite and rare, that it cannot be passed by—for it becomes "a joy for ever." I allude to the head and neck of the female Irish elk—so much grace and delicacy of expression, and so unlike and yet so true, that I have never yet seen its equal in animal modelling. Vastness will be expressed by the mammoth now in progress, strangeness by many, but beauty is personified by that one female elk.

On my way back I passed by the new rootery, which is on a grand scale, and will become very effective so soon as the plants gain character. The rockwork is too little advanced to pass an opinion upon, but its site is well chosen. I have before said that the general keeping is all that could be desired, but there is one portion of the arrangement where the shrubs are made to straggle out of their beds upon the lawn; this part without an army of gardeners defies subjection. The arrangement is very pretty, very natural, and breaks up most thoroughly the hard edges of the outline, but as the Grass is evenly mown up to these outlying shrubs, so to speak, and is allowed to grow up amongst them, it does give a weedy and unsatisfactory appearance.

A few words on the interior of the Palace, and I have done. The greatest improvement is occasioned by taking away the shop stalls—they were incongruous and out of keeping in a place devoted to science, literature, and art. The marble basins are now enriched with Victorias, Nymphæas, Hydrocharis Humboldti, &c., and are seldom to be met with in greater perfection, the Oxford botanic garden excepted. The Oranges have acquired a healthy hue, and do good service, as do the Pomegranates, as far as their foliage is concerned, but I fear they will not flower as profusely as we see them on the Continent.

The large introduction of the hard-wooded shrubs of Africa and Australia, to the exclusion of the soft-wooded species, is a decided improvement; the one class showing evident signs of being too far away from the light, and the other seeming to be perfectly at home and happy. The baskets of plants are even more attractive this than they were the preceding season. Many of the stove plants bear their position well, but there are some that seem to ask for more warmth and a closer atmosphere. The Date Palms that were imported from Egypt as yet show no signs of life, though every care that knowledge could suggest has been bestowed upon them.

My eye now falls upon what Dr. Lindley terms "the ethnological absurdities," and I proceed to examine whether they are really well pourtrayed—whether, as far as I have seen the varieties of the great human family, they are fair types. I am satisfied that they are. I further ask myself whether the variety of statures, form, complexion, &c., that the Creator has stamped upon the varieties of the human race are not worthy to be noted; and also whether the dress, however slight, however grotesque in others, is not worth exhibiting upon the form of Nature's mould?—and, lastly, whether the rude implements, either for war, securing their food, or for any other of their requirements, implies any absurdity by being associated with the figures and their dresses? My answer is, certainly not. Where then the absurdity? Why, in placing men of various tribes of full stature in a mimic array of plants in pots to represent the forest jungles made up of trees of gigantic proportions, and overgrown with an entanglement of creepers that occasionally strangle the monarchs of the forest themselves. Here is the absurdity.

Would I then do away with the ethnological series? Oh, no; but increase, and, if possible, fill up the whole series upon the same principle, till Dr. Pritchard's book should be illustrated with the beings he describes, from the first form to the last. This would be a work, as far as I know, never yet attempted, and one worthy of the grandeur of the building, as I can imagine no series more novel, more instructive, and more interesting than such an one, disposed in a long series in an aisle by themselves. Surely a deeper interest must be felt in recognising the members of our own family than in noting those of the inferior races of the creation. A commencement is made to illustrate such portions of the vegetable and mineral kingdoms as afford food, medicine, or material for the various purposes of domestic economy; this, when further advanced, will be an extremely valuable adjunct; already we have a goodly display of cereals that look like those we remember to have seen at the Exhibition of 1851, by the Messrs. Lawsons. The natural and prepared cocoa and coffee and tea are in samples large enough to identity the quality, as far as the eye goes, with their names written legibly upon them. Then we have the gums, the woods, the dyes of commerce, with the names of the trees that produce them, a series of fruits modelled in wax, but they are not so good as I remember to have seen, and must be replaced as soon as specimens more illustrative can be procured. The idea is a good one, and when worked out, as at the museum at Kew, it will become a most useful and interesting gallery, which a man cannot even lounge through without gaining knowledge.

But I must return, or I shall tire my readers as much as most visitors are fagged after a day of research, and we will descend by the long gallery, whose wall is latticed and which a number of goodly creepers have appropriated for their support. The whole length of this gallery has a border for the growth of the creepers, and I would suggest that if it were filled with Hyacinths, Squills, Crocus, Narcissus, Tulips, and the like, it would prove attractive to visitors in February, March, April, and May, and on leaving they would have the grateful remembrance of the effect of a spring pasture, gorgeous in colour, grateful in scent, and sheltered from the winds and variableness of our spring months. *William Masters, Exotic Nursery, Canterbury.*

Arundel Castle Gardens.—In addition to the annual opening of these gardens and grounds to the inhabitants of the town and their friends, his Grace the Duke of Norfolk has kindly granted this season another privilege of a novel character, viz., the illumination of the flower gardens, which are now in great perfection. Nearly 3000 lamps were in use on the occasion, and being disposed in straight and drapery lines on the terraces with festoons, wreaths, and arches on the arcades and walls, together with a liberal admixture in the flower beds and by the fountain, the effect of the whole was very striking. Upwards of 3000 visitors promenaded in the gardens from half-past 8 to half-past 10 o'clock. The duke's brass band was stationed on the terraces. It is gratifying to add that not the slightest injury was done, and an excellent tone pervaded the gathering. *G. M'Ewen, August 22.*

FLORICULTURE.

National Floricultural Society, *August 23.*—Mr. Robinson in the chair. Dahlias formed the principal feature of this meeting. Twenty-five varieties were entered for the opinion of the judges, and among them some possessed both novelty and fine form. Hollyhocks, both Seedlings and named varieties, were also exhibited in good condition. Of Dahlias, Mr. Holmes, of Hornchurch, sent three blooms of a white-ground variety, strongly tipped with purple. It is large in size, with a full compact centre, and will make a good kind for exhibition. The same exhibitor also sent Circassian Beauty, a fancy below the average in quality. Mr. Wheeler, of Warminster, sent Emperor of the Yellows, a yellow slightly tinged with lake; and Eclipse, a dark plum-coloured kind; the latter was the best of the two, but neither were in good condition. Mr. Keynes, of Salisbury, exhibited five varieties. The one selected by the judges for reward was Reginald, a pale primrose sort, slightly tipped with purple: a full sized compact flower, but rather low in the centre. The others were a fancy, named Mrs. Spary, rather dull in colours; Argo, a large yellow; General Simpson, a bright orange, with high centre, but long petal; and Lord Raglan, buff, which maintained the character given to it at the previous meeting. Mr. Rawlings, of Bethnal Green, sent 6 blooms of Robert Hogg, a shaded purple, of medium size, and broad in the petal; a little ribbiness detracted from its merits. The same exhibitor also sent 3 blooms of Archbishop of Canterbury, a dark purple, with a high centre, and good outline. It was not a large size, but very double. A Label of Commendation was awarded it. Sambo, also from Mr. Rawlings, was poor. Mr. Salter, of Hammersmith, had a fancy variety; a striped kind, but the colours were not sufficiently distinct, being red striped

with crimson. It was good in form, but confused in the centre. Mr. Smith, of Crookham, Hants, had three kinds, named Helen Smith, Lord Cardigan, and General Codrington, none of which were in good condition. Mr. Charles Turner received a Certificate for Bessie, a deep bright yellow, which appeared to be very constant. The same grower also sent another good yellow, named Yellow Beauty; together with Miss Burdett Coutts, which the judges reported fully maintained its previous character—a Certificate having been awarded to it last meeting day. Lollypop (G. Holmes), had a similar mark of distinction from the censors, it having been successfully exhibited last season. Mr. Weatherill received a First Class Certificate for Verbena King of Roses, a finely-formed flower; the same award was also bestowed upon Eugenie, a pale lilac, of good form. A Certificate of Merit was given to Mr. G. Smith for Dandy, an orange kind with a crimson centre and lemon eye; a similar award was also made to Unanimity, which is an improvement on Annie Laurie. There were several others shown, but none deserving of especial mention. Mr. Laing, of Twickenham, contributed several Seedlings, among which was a blue kind, with less purple in it than usual. For Hollyhocks, Mr. Roake, of Clewer, received a First Class Certificate for Perfection, a pink or blush kind, very close in the flower; of this a spike was shown. Messrs. Paul received a Certificate for a delicate peach variety, 3 cut blooms of which were exhibited; it is a full sized large flower. For Cut blooms—12 kinds—Mr. Roake was first with Rosy Circle, Eugénie, Leonice, Mrs. Ashley, Julia, Seedling, Perfection, Lemonade, Primrose Perfection, Mont Blanc, Seedling 6, and Pourpre de Tyre. Messrs. Paul were second with Glory of Cheshunt, Darius, Lord Jocelyn, Pearl, Beauty of Cheshunt, Boadicea, White Globe, and 4 Seedlings. Messrs. Paul also furnished three magnificent spikes of Glory of Cheshunt, Mrs. Ashley, and Beauty of Cheshunt; these were deservedly much admired. Messrs. F. and A. Smith sent an interesting collection of Cut Antirrhinums, showing that progressive improvement is going on in this class of plants. Mr. Salter exhibited 12 varieties of Cut Phloxes, one or two of which were very bright in colour. Messrs. Paul sent 12 varieties of Asters, all very beautiful kinds. Messrs. Fraser also sent 24 varieties of this flower. Mr. Lochner contributed 24 bunches of Verbenas, all good kinds; and Mr. Smith sent his Petunia Hermione, which fully maintained the good character it always has had. A new white Verbena was exhibited by Mr. Westwood, which is much the best of its class out, but it is a very strong grower. Messrs. F. and A. Smith again sent a collection of Balsams, still in good condition.

Miscellaneous.

Effect of the Water-snail in Keeping Fresh-water Aquaria Healthy.—As an evidence of the permanency of the balance capable of being established between the animal and vegetable organisms by the introduction of the water-snail or other phytophagous mollusk, I may state that the same water in which my original experiments were made in March 1849, has been in continual use up to the present time, several fish living constantly in it, without disturbance, and that it is now as bright and in as healthy a state as at the first period of its being employed. Again, in a small jar of about one pint capacity, having a single plant of Vallisneria spiralis growing healthily in it, and with a few small water-snails as scavengers, I succeeded during the spring of 1853 in hatching and rearing a young trout. The egg was obtained from Mr. S. Gurney, jun., and had been removed from his preserves in the river Wandle; the shell ruptured the day after my receiving it, and it was maintained in a perfectly healthy state during the whole of the period required for the development of the respiratory organs, and the complete though gradual absorption of the ovum. This development was perfected in 15 days from the bursting of the shell, till the period that the fish could sustain itself continuously in the water, and was able to swim strongly. Having arrived at this stage of maturity, the vessel became far too small for the free use of its active powers of locomotion, and it was therefore transferred to a small tank containing several minnows, when to my great annoyance it was immediately seized and devoured. As another instance of the voracity of the finny tribe, and their destruction of each other, I may mention here that I had on a previous occasion placed several small trout fry over-night in an aquarium containing some gold fish, but they must have been rapidly preyed upon, as no trace could be seen of them the following morning. These facts will demonstrate clearly the havoc which must take place in rivers and streams among the young fry of various fish under ordinary circumstances, when they are proved to be devoured with such extraordinary rapidity even by such species as the gold fish or carp tribe and the minnow. *Warington in Annals of Natural History.*

Calendar of Operations.

(*For the ensuing week.*)

Conservatory, &c.—New Holland plants, as Acacias, Hardenbergias, &c., growing on the rafters and pillars of this house, will flower all the better for being kept sparingly supplied with water at the root for a few weeks in autumn, after they have made their season's growth, so as to get the young wood well matured, which is essential to a first-rate display of bloom. These plants are subjected to long periods of excessive drought in their native habitats, and are said to thrive in situations where there is hardly the appearance of moisture in the soil for many weeks; but they cannot safely be subjected to such treatment under artificial circumstances, and there is no necessity to do so, as they will flower very profusely if kept sufficiently dry at the root to check growth and get the young wood well ripened before winter: and similar treatment will be suitable for many of the things planted out in the borders, particularly Orange trees, for these and many other hard-wooded plants bloom but poorly unless the young wood is well ripened in autumn. Shading must be used sparingly after this season, particularly on cloudy days. Many of the Fuchsias will be past their best, and should be removed to make way for the Liliums, which will now be coming into bloom, throwing away at once every plant which is not likely to be wanted for next season, especially large specimens of worthless varieties which are not worth wintering, as good sized plants can be grown for next season from cuttings put in now. The varieties with white corollas will be universal favourites; but they appear to be rather weakly growers, and parties wishing to have specimens of them next season should see about securing promising young plants at once. Young stock of hard-wooded things in pits and frames will be growing freely, and must have every necessary care afforded them. Water freely, but avoid getting the soil too wet, and dew the plants over-head with a fine-rosed syringe on the evenings of fine days, drawing off the lights at night whenever it can be safely done, so as to expose the plants to the night dews, which will greatly assist in securing strong vigorous growth. Attend at once to anything requiring more pot room, in order to get the plants moderately well rooted into the fresh soil before winter. Stove.—Specimens of such things as Echites splendens, Stephanotis, Allamandas, &c., which have done their season's work, will be better removed to a cooler and drier house, which will be a more suitable situation for them while ripening their wood than the moist warm stove, but if this cannot be done, then they should be placed in the coolest end of the stove, keeping them rather sparingly supplied with water at the root, and exposing them as freely to air as circumstances will allow. Take advantage of every leisure hour to wash the foliage of such things as require it, looking carefully for and destroying mealy bug and scale. Ixoras and many hard-wooded stove plants are very subject to the latter, and in most cases require to be frequently looked over to keep them clean. Keep the shoots of young specimens nicely tied out, and give timely attention to training, so as to secure the desired form of specimen. Look well to the stock of things for winter flowering, re-potting any that require more pot room, keeping such as have made their wood and require a period of comparative rest to bloom well rather dry and cool, and encourage any that may be backward in their growth with plenty of warmth and moisture.

FORCING DEPARTMENT.

Pineries.—Plants growing in dung pits must be freely supplied with air to prevent their getting drawn, and they should also be kept near the glass and not allowed to stand too closely together, for strong robust plants need hardly be expected unless this is attended to, and weakly drawn plants seldom or never yield fine fruit. Give careful attention to plants swelling their fruit, affording them plenty of warmth and moisture, and as much manure water at the root as the soil will bear. Remove useless suckers and gills as soon as they are perceived, which, if left on the plant, only rob the fruit and weaken the suckers which it may be necessary to leave on the plant for keeping up the stock. Do not allow young stock in free growth in the succession pits to stand too closely together, nor to sustain any check through neglect in watering, or the want of pot room. Shading, if not already discontinued, may safely be dispensed with for the season. Plants growing in beds of soil must also be carefully attended to with water, keeping the soil in a nice moist state. Where rapid growth is required keep as warm and moist as can be done without drawing the foliage, and give plenty of strong clear manure water at the root, and the plants will make rapid progress for the next two months. Vineries.—See that Vines from which the fruit has just been cut are free from insects, giving the foliage an occasional washing with the engine if red spider is at all troublesome; and use every precaution to keep the leaves in health as long as possible. Prevent the growth of laterals, which only shade and injure the principal foliage. Late Grapes colouring should be assisted with slight fires in cloudy weather, especially Muscats, which, after this season, where they are not already all but ripe, will require gentle fires, unless the weather should prove unusually fine. Thrips are frequently very troublesome in late Vineries where plants have been grown under the Vines, and where there is any reason to expect these, the foliage should be frequently examined closely; giving the house a heavy smoking as soon as they are perceived, and repeating this for two or three times at intervals of about a week, shading the house the day after smoking, where it can be done so as to be able to keep it rather close, will render the cure more effectual; and if the pest is taken before it gets quite established, it will be easily got rid of by two or three smokings, but unless taken in time it is very difficult to eradicate. Peaches.—Give every attention to getting the wood well ripened, as next year's success will very much depend upon this being properly effected. Keep the foliage clean and free from insects, and endeavour to preserve it in health as long as possible. Give air freely both day and night, but keep the roots as dry as can conveniently be done, therefore guard the inside borders from heavy falls of rain, shutting up the sashes at night when there is reason to apprehend much wet. Any gross shoots that may still incline to grow should be stopped, as if left they encourage the action of the roots, and cause a greater tendency to growth than would otherwise be the case. Loosen the surface of the border where this is at all close, in order to admit air and warmth, and promote evaporation.

HARDY FRUIT AND KITCHEN GARDEN.

Fruit trees have already made as much young wood as there is much chance of getting matured. Where this is the case, go over the trees at once and stop a portion of the shoots, beginning of course with the strongest. This, as was stated last week, will be found to serve the end in view much more effectually than a general stopping at this season, which would probably be of no farther service than inducing the production of a mass of laterals, and do more harm than good; whereas, stopping the stronger shoots will only throw the sap into the weaker ones, and if we should be favoured with a fine autumn the buds and the shoots stopped will become plump without starting into growth, and in any case there will be fewer laterals produced by stopping only a portion of the shoots than the reverse would be if the shoots were stopped generally. Winter Onions should be sown at once, also Cauliflowers for the early crop next season, a small bed of pickling Cabbage, Brown Cos, and some hardier sorts of Lettuce to stand the winter.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON.
For the week ending Aug. 23, 1855, as observed at the Horticultural Gardens.

The highest temperature during the above period occurred on the [illegible] 1843—therm. 85 deg.; and the lowest on the 29th, 1850—therm. 32 deg.

Notices to Correspondents.

Diseases: *E W.* Your Medlar and White-thorn leaves are infested with Æcidium laceratum, a common parasite on White-thorn. *M J B.*

Greek and Latin Names: *R I.* We will attend to your suggestion.

Insects: *W Y.* The grub taken from the inner bark of the Pyrus Sorbus of course gnawed a hole through the pasteboard box and escaped before reaching us. It was doubtless the caterpillar of the wood leopard moth, Zeuzera Æsculi; a few whiffs of tobacco smoke directed into their burrows will dislodge them.—*[illegible]* The large insect is Sirex gigas, which lives in Fir timber, and the dark coloured wasp is Vespa Britannica.—*C P T.* The patches you allude to on the bark of your Pear tree are masses of eggs of some kind of moth.—*J S.* The leaves of your Pear trees are infested with the slimy larvæ of a black winged saw-fly, Tenthredo (Blennocampa) tethrops. Dust the leaves with lime or syringe them with lime water.—*W B.* See last answer.—*E K S.*—Your Swede Turnips are attacked by the [illegible] grub of the Turnip saw-fly (Tenthredo spinarum). Repeated dusting with lime is very serviceable, but lots of young cabbages turned into the field are still better.—*G F.* The caterpillar you have sent from the inner bark of the Oak is that of the goat moth, Cossus ligniperda (see *Gardeners' Chronicle*, 1847, p. 303, for figure and description). They may be dislodged by means of tobacco smoke blown into their burrows. *W.*

Lease: *A H.* We never answer legal inquiries. Your solicitor is the proper person to consult upon the covenants of your lease. We suppose that in the eye of the law a bush would be regarded as a tree.

Monstrous Sweet William: *G.* You will find a monstrous one similar to that you have sent figured at p. 452 of our present year's volume. ‡

Names of Fruits: *J M E G.* Peaches: 1, perhaps Grosse Mignonne; 2, Noblesse; 3, Noblesse; 4, R. George. Nectarines: Part Elruge and part Violette Hâtive: those that are red at the stone are the Violette Hâtive; those that are pale, the Elruge.—*G D Vallance.* 1, a small oval purple Plum, not known, but certainly not worthy of its situation on a wall; 2 resembles the Nectarine Plum, but is not so good.—*M F.* Your Gooseberry is the early Green Hairy.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Caroline.* Euphorbia Peplus, and what appear to be fragments of a small starved state of Ranunculus sceleratus.—*T D.* Asplenium Adiantum nigrum.—*W C.* Pteris aspericaulis, *Wall.*, a native of Nepal and other parts of India: your plants are probably the only living specimens in this country. *S.*—*J M.* Rhus Cotinus, the common Venetian Sumach.—*R J.* It is Phallus impudicus, the most filthy of plants.—*E M.* Genista tinctoria and Cytisus nigricans.—*Dee.* 1, 2, and 4 are Q. sessiliflora; the other is pedunculata.—*West Cotton.* Blumei is a native of Java; we do not know when it was first introduced into England.—*R A A.* Polystichum [illegible], *Presl. S.*—*F M.* Todea africana, *Willd. S.*

Puddling: *Bertra.* We do not believe that wet clay will ever stop eels. We should certainly use concrete, the cheapness of materials: but at what price it can be executed depends upon whether good sharp gravel is at hand or has to be carted from afar. Any labouring man, furnished with good fresh lime, water, and clean washed gravel, can make this concrete. If filled in between your two walls, the mass will soon become as hard as rock, and perfectly impenetrable by either eels or rats.

Roses: *J M.* Smoke from fires of burning brushwood could not, we think, injure your Moss Rose 80 yards from them. The failure doubtless arises from some other cause. ‡

Erratum: In Mr. Cole's advertisement inserted last week, for "Seedling Shilling's Calceolarias, read "Seedling Shrubby Calceolarias."

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Copperas, 6l.

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7l. 10s. in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

46, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Copperas, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.

MR. HUMBERT, of Watford, Herts, a practical Surveyor and Land-Agent of more than 15 years' standing, offers his services to Gentlemen about to drain Land and Bogs. He will undertake to set out and superintend himself the execution of the work at a charge of 5s. per acre, and the expenses incurred in his travelling; or he will contract to complete it in a specified manner to the satisfaction of the Inclosure Commissioners at a fixed price per acre. Mr. Humbert has drained strong stiff land in the most careful and complete manner, with 1½ inch pipes, and proper mains, the drains being 4 feet deep and 30 feet apart, at 4l. per acre and under, and he can give reference to his employers in that and in other instances.

Watford, Herts, Aug. 25.

PAXTON WORKS, SHEFFIELD.

SAYNOR AND COOKE, Manufacturers of the celebrated Exhibition Prize PRUNING, BUDDING, and GRAFTING KNIVES, VINE and PRUNING SCISSORS, &c. These articles are Warranted to stand any kind of work, and to carry the keen edge of a razor without requiring to be sharpened as frequently as is usually necessary to obtain that sharp edge so requisite for the comfort and use of the practical gardener. The blades are also warranted to wear through to the back. They are used by all the eminent gardeners in England, Ireland, and Scotland, and can be purchased of any nurseryman or seedsman in the three kingdoms. Those who may not have used them are respectfully solicited to give them a trial. The Great Exhibition Prize Medal of 1851, and the Prize Medal of the Horticultural Society of Manchester, at their Show of 1854, was awarded to SAYNOR & COOKE for their superiority of material and workmanship. Established 1738.

CLAYTON, SHUTTLEWORTH, & CO.'S PRIZE PORTABLE STEAM ENGINES, AND COMBINED THRESHING, STRAW SHAKING, RIDDLING AND WINNOWING MACHINE may be seen at their London Establishment, 6, Fitzroy Terrace, New Road, where all information relative thereto can be obtained. These Machines are constructed to barn Barley, and make a perfect separation of the chaff from the pulse. They are fitted with Elevators, which deposit the grain into bags, and beyond the feeder of Machine require no hands except to take away the Corn, &c., as threshed, the whole of the operations being performed by self-acting machinery, whereby the Corn, Straw, Chaff, and Pulse are delivered in the places assigned for them.

C. S. & Co. have paid special attention to this class of Machinery, and Fixed Barn Machinery, and from the position they have taken at the Royal and all the leading Agricultural Shows of England, flatter themselves that for efficiency, durability, and simplicity, their Engines and Machines are not surpassed by any other maker in England. All letters forwarded to the Works at Lincoln will have immediate attention; and Illustrated Catalogues forwarded to all parts of the kingdom postage free.

"FRIGI DOMO."—Patronised by her Majesty the Queen, the Duke of Northumberland for Syon House, His Grace the Duke of Devonshire for Chiswick Gardens, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, Mrs. Lawrence, of Ealing Park, and — Collier, Esq., of Dartford.

THE BEST PROTECTOR FROM THE HEAT OF THE SUN. "FRIGI DOMO," a Canvas made of patent prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, from attacks of insects and from morning frosts. To be had in any required length, 2 yards wide, at 1s. 6d. per yard run, of EDWIN THOMAS ARCHER, whole and sole manufacturer, 7, Trinity Lane, Cannon Street, City, and the Royal Mills, Wandsworth, Surrey; and of all Nurserymen and Seedsmen throughout the kingdom. "It is much cheaper than mats as a covering."

WATERPROOF PATHS.
BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the trowel, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

LIQUID MANURE.

PATENT LIQUID-MANURE DISTRIBUTOR OR WATER-CART, for the Distribution of Guano, &c., warranted not to clog up or otherwise get out of order. It has Waterproof Joints, and will scatter its Liquid from 12 to 15 feet wide. It will work equally well on hilly or on level land without any alteration. It is therefore fully adapted for Drill Crops or Pasture Land, or for Watering Streets.—Full particulars may be obtained of the Patentee, ISAAC JAMES, Tivoli, Cheltenham.

WARNER'S 4½-inch IMPROVED LIQUID MANURE PUMP, with Ball Valve, fitted with 1½ inch Brass Union for attaching flexible suction, with strong wrought iron Straps for screwing on to any ordinary Water butt or Cart, as shown in drawing.

Price of Pump and Union, 50s.

1½-inch Flexible Rubber and Canvas Suction for ditto, 3s. 6d. per foot.

1½ Gutta Percha Suction, 1s. 6d. per foot.

WARNER'S IMPROVED LIQUID MANURE, OR GENERAL PORTABLE PUMP.

The valve is a ball of imperishable material, and cannot clog in action. The barrel is of galvanised iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

Price of 4½ in. Pump, with legs, 3l. 3s. The barrel is 27½ in. long, and the legs are 5 ft. high.

1½ inch Gutta Percha Suction Pipe, 1s. 6d. per foot.

1½ inch Flexible Rubber and Canvas Suction Pipe, 3s. 6d. per foot.

May be obtained of any Ironmonger or Plumber in town or country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER & SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c.—Engravings sent on application.

WARNER'S PATENT VIBRATING STANDARD PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Wells at a depth not exceeding 30 feet.

Diameter of Barrel	Length of Barrel, under nose.		£	s.	d.
2½ in.	short 1 ft. 7 in.	Fitted for lead, gutta percha, or cast iron flanged pipe, as required.	1	12	0
2½ „	long 3 „ 3 „		1	15	0
3 „	ditto 3 „ 6 „		2	12	0
3½ „	ditto 3 „ 6 „		2	18	0
4 „	ditto 3 „ 6 „		3	5	0
2½ „	short, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing		2	12	0
2½ in.	long ditto	ditto ditto	2	15	0

The short barrel Pump is very convenient for fixing in situations of limited height and space, for the supply of troughs and sinks in Wash-houses with soft water from underground tanks, or in Hot, Forcing, and Plant Houses: they may be fixed, when desired, under the stage.

May be obtained of any Ironmonger or Plumber in Town or Country, at the above prices, or of the Patentees and Manufacturers, JOHN WARNER AND SONS, 8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water, by means of Wheels, Rams, Deep Well Pumps, &c.; also Fire and Garden Engines, &c. &c.—Engravings sent on application.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
MEETING AT CARLISLE, JULY, 1855.
FIRST PRIZE AWARDED TO
RICHMOND AND CHANDLER'S No. 3 B CHAFF MACHINE. Price £7.

All the various modern Implements of Agriculture manufactured on the most scientific and improved principles, suitable for home use and exportation.—Address, RICHMOND & CHANDLER, Salford, Manchester; and 32, South John Street, Liverpool.

☞ CATALOGUES GRATIS.

CLARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronized by the Queen and other Governments, the East India Company, the principal Dock Companies, many public bodies and by the nobility, gentry, and clergy, for continuing years at their country seats. The Anti-Corrosive is particularly recommended as the most durable outdoor Paint ever invented for the preservation of every description of Iron, Wood, Stone, Brick, Canvas, Cement, &c., which has been proved by the practical test of upwards of ten years, and by the testimonials herewith (50 and 100 testimonials in his favour), and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of colours, prices, testimonials with a copy of the testimonials, will be sent on application to WALTER CLARSON & SON, 2 Great Winchester Street, Old Broad Street, Royal Exchange, London. No Agents. All orders are particularly requested to be addressed direct.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1855.—The SEVENTH GREAT ANNUAL EXHIBITION of CATTLE, SHEEP, PIGS, and DOMESTIC POULTRY, will be held in Bingley Hall, Birmingham, on TUESDAY, WEDNESDAY, THURSDAY, and FRIDAY, the 11th, 12th, 13th, and 14th of December next, when PRIZES will be awarded as follows:—

	£	s.	d.
CATTLE.—Including Two Extra Prizes of 20l. each and Two Gold Medals or other pieces of Plate of the value of 20l. each, for the best Ox or Steer and the best Cow or Heifer	340	0	0
SHEEP.—First Prizes of 7l., and Second Prizes of 5l., for Leicesters, Long-Wooled Sheep not being Leicesters, South or other Down Sheep, Shropshire, and other Black or Grey-faced Short-Wooled Sheep—10 classes	170	0	0
PIGS.—Including Prizes for Pens of BREEDING PIGS of a large and small breed	60	0	0
ROOTS.—Including a Silver Cup, value Five Guineas, for the best Collection of four different varieties	27	0	0
POULTRY.—Including Nine Silver Cups, of the value of Ten Guineas each, for the best pen of Dorkings, Hamburgh, Spangled Hamburgh, Polish, Spanish, Dorking, Cochin China, Game, and Gold or Silver Bantams, also for the best two pens of Pigeons, to be exhibited specially for this prize	451	10	0
	£1,037	10	0

Exclusive of Silver Medals to the Breeders of Cattle, Sheep, and Pigs, and Prizes in the Extra Classes and for Cottagers' Poultry.

Mr. OTTLEY has also offered a Gold Medal of the value of Ten Guineas as an Extra Prize, for the best pen of POLISH FOWL of any colour, to be selected from the several classes for this variety.

Prize Lists, and any further information may be obtained from the Secretary.

JOHN MORGAN, Jun., Secretary.

Offices, 38, Bennett's Hill, Birmingham.

The Agricultural Gazette.

SATURDAY, AUGUST 25, 1855.

WE have seldom seen so curious a case of disease as one which has affected the Oat crop of one of our correspondents during the present season, and threatening destruction to about a fourth part of the produce. It is unfortunately one of those maladies which are as obscure in their origin as they are difficult of treatment, and which are most probably altogether independent of culture, and inveterate in the seed before it is committed to the ground. A concurrence of some peculiar external conditions has no doubt, in the first instance, produced the disease; but even if disease had been suspected, and had there been any opportunity of studying its several phases as they arose, affections of this kind are frequently of so subtle a nature as to baffle inquiry. In the present instance, however, the seed was procured from Scotland at a distance of a hundred miles or more from the farm where it was sowed, and there was apparently no suspicion of mischief till the crop approached maturity. Our specimens are not indeed all we could desire, for we have nothing more than two panicles without leaves or investing sheath. It is probable, however, from the condition of the common stem, which is decidedly striped, that the leaves must have presented a variegated or partially chlorotic appearance long before the panicles were developed, and even when they were yet within the sheath. In one panicle there is not a single flower which is not bleached in every part. The anthers and stigmas are perfectly formed, and even the pollen grains have gone through part of their growth, though they are evidently abortive. In the other panicle about 12 spikelets only have proceeded beyond the first expansion of their valves, and in these too partial chlorosis has taken place in every part, but not to such an extent as to prevent impregnation or the development of the seed, though the latter is clearly in an unhealthy state, and totally unfit for producing a sound and trustworthy sample. It is very possible that the crop from whence the seed originated was in a similar condition, and there is every probability that if the scanty harvest, which must be the result of the crop in question, were used for seed, the produce would be more or less tainted. It is not certain, indeed, that such would be the case, for the seed of variegated plants does not necessarily produce a parti-coloured crop, though it is always probable that such will be the result. Under the present system, the cultivator must always be at the mercy of others, but the time must ultimately come when it will be a profitable employment to raise crops purposely for

seed, in the hands at least of men of probity and talent, whose judgment and integrity will be equally a guarantee for acquisition of seed as true and pure as it is possible to procure. The farmer can in no case be completely insured against failure; but we do not doubt that the best results would arise from some well digested system of raising agricultural seeds for the market. At present it is a mere chance, whether the seed be sound or not; for the more subtle complaints are not indicated by any external signs, or at least by such as would be likely to awake the suspicions of the purchaser. The agitation of these questions of Vegetable Pathology, though it seldom falls to our lot to be able to suggest a present remedy, will at last direct attention to many a point which has hitherto escaped notice. In the half-grown seed before us there is indication enough of disease; how far that might be discoverable in the ripe seed is more than we are able to assert. Our correspondent* will at least take care that none of the produce of his diseased Oat field can by any means be used for seed corn, for there is no knowing to what extent a malady may be propagated, though in the first instance its appearance may seem altogether fortuitous. *M. J. B.*

Having made the bold announcement that all mechanical difficulties in Steam Culture have been conquered—namely, by Fisken's *method of ploughing with a stationary engine;* we are bound to make good our assertion by facts. And here some critical reader may question whether, in adopting the principle of a stationary motive power, communicating motion to an implement by wire ropes and pulleys, we are not running counter to all that has been advanced for years in this Journal concerning the fallacy of a steam *traction implement*, and the necessity for a *revolving* tiller, the speed of which must be always proportionate to the rate of onward movement of the carriage it is attached to; this indispensable condition pointing to the locomotive engine with digging-cylinder behind as the best form of machine, &c., &c.

Now we have space only to say in a word—the locomotive idea was the best that could be had when the subject was first studied, and may be subsequently renounced for a better, without affecting the principles advocated. The principal points taught by Mr. Hoskyns on this subject we continue to maintain, and welcome the new invention not because it has applied steam power to a common plough, but because its *peculiar mode of so doing supplies us with the means of driving a rotatory or any other form of tiller.*

When Fowler's clever system of tackle for the draining plough first appeared, everybody regarded it as a foundation for steam ploughing, though evidently a considerable modification was necessary before the apparatus for drawing a tremendous implement of 100-horse draught, at a slow pace and in "furrows" (as they may be called) several yards apart, could manage a light quickly-moving implement making 9-inch furrows upon the entire surface of the ground. The chief difficulty was in fixing and shifting the anchorages, each pulley having so firm a hold upon the headland as to sustain a strain equal to double the draught of the ploughs *plus* the draught of a wire rope hundreds of yards in length, and at the same time being readily shifted forward at intervals of a few minutes. Hitherto, no plan had been proposed that did not require too much labour in the digging of anchor holes, setting down posts, &c.; but at last an inventor has surmounted the obstacle, not by improving the old form of anchorage or any other detail, but by a stroke of genius producing a new scheme of action altogether.

Mr. Fisken's aim seems to have been *to lessen the strain upon the anchorages,* and to reduce to a *minimum* the labour connected with their fixing and adjustment. When an implement is dragged across a field by means of a rope, of course the purchase at the end of the rope must bear a horizontal strain equal to the draught of the implement and of the rope itself; and with an endless rope passing round a pulley, this strain, of course, will be *doubled:* but if the rope is left at rest, and we make the implement propel itself along *by winding up a single fixed rope,* the strain upon the anchor will be reduced simply to the draught of the implement. Instead of pulling the ploughing implement by main force, then, we fix upon it a grooved barrel, and give the stationary drag-rope (fastened down at each end of the field) one turn round this barrel, so that when slowly revolving it may work its way along the rope, taking the implement with it; and next we have to communicate motion to the barrel from the steam-engine, which is at a distance, in such a manner as will cause least additional strain upon the anchors. An endless rope, driven by the engine, and passing round pulleys attached to the anchors, is a necessity of the case; and by giving one line of this rope a turn round the rigger upon the plough-carriage, the barrel may be driven, and the work proceed. But if an endless rope be a necessity, wherein lies the value of a fixed rope and barrel as an addition? Well; the originality of the plan consists in this endless rope *moving at a high velocity*; the strain it has to bear, and consequently its requisite strength and weight, being reduced in inverse proportion to its speed. The principle is just that of applying one's little finger at the long end of a lever in order to lift a ton weight.

In Fisken's most ingenious invention, as at present exhibited, the leverage gained is eleven to one; that is, the driving-rope is running 22 miles per hour when the plough-carriage is going only two. The strain upon the rope is thus only *one-eleventh* of the whole draught of the implement. The rope does not reverse its motion, but works round the rigger upon the plough-carriage, always in one direction; so that as the implement traverses backward and forward, this strain is alternately exerted for and against its progress, the anchorage at the far side of the field having to sustain a drag equal to the draught of the implement *plus* one-eleventh; and the other, which is nearer to the engine, the draught of the implement *minus* one-eleventh—or rather, as it is used to divert the direction of the rope, it is subjected to a strain equal to the draught of the implement. How much more easy to fix and shift these anchorages, than when they must be made to bear double the strain?

But this is not all. The weight and draught of the rope itself add to the strain upon the anchors. With a wire rope strong enough to drag the implement by direct traction, this is found to be very considerable; if running along the ground, the friction is great, and if supported by friction-rollers mounted upon stand frames (as Fisken's driving-rope is), the weight must occasion also a very great strain upon the anchors. On the contrary, a rope running at a high velocity may be exceedingly light, Fisken employing merely *a hemp cord three-eighths of an inch thick* to work two ploughs at once. This being so light, and running on friction-wheels set at intervals along the field, occasions only a trifling pull upon the anchorages.

The *economy of power* is no less remarkable than the ease and *portability* arising from this arrangement; and this point we will elucidate in our next paper. *I. A. C.*

Before winding up our remarks on the observed causes of infertility we should have referred to instances where defective fertility is attributable to excessive stiffness and adhesiveness of soil. The clays with which we are best acquainted are those upon the blue lias formation. The poor pastures on this clay become good pasture under the influence of manure. The "home" ground upon a blue lias dairy farm is generally green, when all the rest is brown. Drainage too has benefitted these clays. An arable farm with which we are acquainted on this formation, after drainage 3 feet deep and 20 feet apart, has been most productive of heavy crops of Beans and Wheat, repaying the expenditure most liberally; and drainage and manuring will, we believe, thus cure most clays of infertility. Instances exist of land in the neighbourhood of Bristol where the town and stable dung brought out from Bristol have so enriched and loosened the poor and stiff clay soils upon the lias, that crops are produced which are obtained only from land in the highest state of fertility. Gas lime is used near Bristol, a waggon load per acre, with good effect on these stiff soils.

Burning is another remedy which not only diminishes the stiffness of clay soils directly, but which renders them more able to give up to plants the fertilising matters they contain. In the fifth volume of the Journal of the Royal Agricultural Society of England will be found the history of an improvement of this kind effected by Mr. Randell, of Chadbury, on a farm near Evesham. Land worth 7*s.* 6*d.* per acre—a foul Bean stubble entered to in autumn—was skimmed to the depth of about 1½ inch, and all that the plough raised was burned with faggots, at the cost, including spreading, of 42*s.* per acre. It was then ploughed and scuffled, and, the weather being favourable, was rendered perfectly clean. It was then planted in October with Vetches, which the following summer were eaten off by sheep folded on them, and this was succeeded by Wheat, which produced one bushel in the field more than 45 bushels per acre. The produce was sold for 7*s.* 6*d.* per bushel, and this crop therefore produced more than the fee simple of the land in its former state. Mr. Randall states other instances in which clay land thus burned to the extent of perhaps 200 cubic yards per acre by faggots and by coals was rendered fertile by this means. In a subsequent volume of the Journal Mr. Pusey relates a somewhat similar case as coming under his own observation at Longwater in Berkshire, where the "very stiffest clay," worth 10*s.* per acre, had, by draining with stones at 10 feet apart and 45*s.* spent in burning, yielded 45 bushels of Wheat per acre; the effect of ashes (50 cubic yards per acre), by themselves being ascertained by the crop (37 bushels per acre) obtained where none were used. Even on the still stiffer clays of Kent and Sussex, drainage, we are told, is effectual for their amelioration and improvement. This, and the application of bulky manures, and the practice of burning, seem then to be the means which observation ascertains to be efficient in the fertilisation of stiff infertile clays.

The application of lime must not be forgotten in our enumeration of the means of fertilising land. No dressing is more universally in vogue than lime, whether in the form of the heavy application once in the commencement of the lease which is common in Scotland, or in the more frequent smaller quantities applied in England, or in the still more frequent, and still lighter dressings recommended by Professor Way. Lime is admitted by all, whether theorists or farmers, to be one great cause of fertility in soils. How it directly acts in the removal of infertility has been observed in the case of many a moor and boggy soil, and how it increases the productiveness of fertile lands, is witnessed in the farm practice of every county in the kingdom and on every kind of soil, from the loosest sand to the stiffest clays. We know a farm which when broken out of Grass received a heavy dressing of lime over the first corn stubble; and in one of the newly broken up fields a ridge was left unlimed as an illustration of the application; and this it continued to illustrate, more especially by the produce of the grain crops on that field, for many subsequent years. The direction of the ridges had been altered since that blank was left; but there, lying obliquely across the new furrows, was the perch wide land as plainly marked as ever in each alternate year by the relatively scanty straw and yield of the grain crop grown upon it. The heavy dressing of 250 to 300 bushels per acre, which is sometimes practised, is advisable only in the case of peaty soils, or land full of vegetable matter which has never been limed before. The more common application of half a bushel to the perch once in a six or eight years' rotation is an abundant dressing under ordinary circumstances.

A SKETCH OF PIPE IRRIGATION IN SCOTLAND, June, 1855.

There was a time, and it is not so very long since, when it was popularly supposed that any man could be a farmer; when the tradesman who had failed from want of ability to carry on the business to which he had been brought up, when the idle careless dissipated younger son, or the middle-aged butler who had married the housekeeper, or in short any one whose habits and education had previously been the very reverse of agricultural, found no difficulty in procuring a farm, and for a time at least continuing to hold it. Routine was supposed to be the only thing requisite, in addition to some small capital often ridiculously insufficient. The rent was probably not great, but the produce of the land was small, and the finale too often ruin to the tenant and trouble and embarrassment to the landlord.

Matters are now different, or at least a change is going on. It is true that there still exist large tracts of country in primitive agricultural slumber, but it cannot last; there is a restless spirit abroad which will permit no sleepiness, and there is a power more potent than steam or electricity which is urging on the progress of agricultural improvement, and which will continue to excite the agricultural mind until the most unlikely and unwilling are swept along with the current: and that is Necessity. The abolition of Protection has acted upon British agriculture like the unaccustomed spur upon the highbred courser, it has literally bounded forward under the sharp persuasion of Necessity, and landlord and tenant have alike set their minds to work, calling to their aid the science of the chemist and the constructive skill of the engineer, in order to avert the ruin which they fancied was before them. The principle is the same taught by the old story where a new landlord having been asked by an old tenant for a reduction of rent, instead of granting the request, actually increased it. Aware of the capabilities of the farm, and also of its careless cultivation, from personal inspection, he took this method of inculcating a useful lesson to all. The tenant not liking to quit the home of his childhood tried it again, and under the fresh stimulus to exertion, not only paid the increased rent but never more wanted a reduction. Of course the plan would not succeed in every case, but in this instance the good judgment of the landlord led him to see what was required.

A perfect farmer is as difficult to meet with as a perfect horse, so many qualifications are requisite.

---

* We should be extremely obliged when the crop is ripe, if the "Lancashire Farmer" would forward to us a few seeds, and if possible from partially abortive panicles.

Capital he must have, of course, but that is not as some seem to suppose all that is necessary. Much is undoubtedly lost to individuals and to the country by the working of farms without enough capital, but it is also true that much money is often squandered on so called agricultural improvements and high farming most needlessly. The modern and model farmer requires education, enterprise, and energy, but, above all, a sound judgment, that he may not be led away by the thousand and one speculative experiments of the day on the one hand, nor satisfied to resist all modern improvements as mere innovations on the other. Nor must the perfect farmer be a mere amateur—he must require to live by his farm. The spur of necessity must keep him to his work. For illustration of this, on a large scale, we have only to look at the sister kingdom of Scotland. We shall there see what great things have been done for agriculture, chiefly under the pressing exigencies of a less favourable climate and a less fertile soil than generally speaking are enjoyed in England. The rent paid for land in Scotland in many cases is a marvel to the English farmer.

The example set in Scotland so many years ago by the establishment of the Highland and Agricultural Society, with its shows and premiums, was a great step towards the progress of agriculture. But without entering minutely into all the Scottish improvements, it will be sufficient to point to some of the most obvious, such as the universal adoption of the two horse iron plough and one horse cart, and the late Mr. Smith's, of Deanston, frequent drain and subsoil plough system, and now we have the system of liquid manuring by means of reservoirs and pipes, which it is the object of this paper more particularly to notice.

The importance of this system cannot easily be overrated, if it be found to answer in the application of the sewage of our large towns. The wonderful effects of town sewage in large quantities, distributed by means of open gutters, has long been known, and is demonstrated most satisfactorily at Edinburgh, where land so treated lets as high as 30*l.* per acre, but it has yet to be ascertained whether if administered in smaller quantities by the subterranean pipe system with the flexible hose and jet, it will be sufficiently remunerative to warrant the necessary expenses. This question will soon be set at rest, as the system is now in full operation at Rugby in Warwickshire, and elsewhere, and the close of the present season will probably give it a final settlement. But apart from the town sewage question, there remains the important one of house soiling, and the distribution of its liquid by the pipe system, which began in Scotland, and is fast gaining ground there.

In England, Mr. Mechi, of Tiptree Hall, has done much to make it known, and several other gentlemen have practised it with success, but in Scotland we find it working on in quietness where it might be least expected. A slight sketch of what is doing there at present may not be uninteresting to the agricultural world.

Being about to erect some farm buildings in England on the liquid manure system, we determined upon making a personal inspection of the various establishments in Scotland, and we give the result of our observations, in the hopes that it may be of use to some brother agriculturist, or at least serve to point out to him where he may see and judge for himself.

It was natural that we should first turn our attention to that locality where the experiment of liquid manuring on the pipe system was originally attempted, and is still carried on with complete success. Accordingly, we took the Caledonian Railway to Glasgow, where we arrived about the middle of a fine day towards the end of April, and the same afternoon proceeded to find out the celebrated cow-feeding establishment of Mr. Harvey. Wending our way towards the higher regions of Glasgow, we found ourselves in the very dirty, but no doubt very busy and very healthy locality of Port Dundas. Proceeding some distance along the banks of the blackest of canals, after being three times wrongly directed (once by a policeman), we reached our destination. If any pleasing scene of rural happiness or rustic beauty had ever crossed our countrified imagination in connection with the stream of lacteal fluid said to flow so copiously from this fountain head of milk, it was speedily dissipated. No neat farmyard, no rosy milk maids, nor even the sweet breath of cows was here. All externally was dark, dingy, and redolent of pot-ale, as the sour distillery wash is called. But external appearances are not everything, and however much we might have felt disappointed outside, we confess that the first view of the interior of one of the cow byres in a great measure restored our equanimity. It is a fine sight to see a hundred cows at one view, especially where they look clean, healthy, and in fine condition, as they did here. In our admiration of the inhabitants we forgot altogether the habitation; not that there was a great deal to find fault with there either. It was not intended evidently for a show or a fancy farm, but a good business speculation or money-making concern, and therefore economy had been studied. Nor is there any cause for blame; one might as well find fault with money-making Glasgow for not being so romantically beautiful as Edinburgh.

There can be little doubt as to its being highly remunerative. We were informed that there were about 800 cows in the different byres at that time, and that there had been sometimes as many as 1000. It did not strike us that the animals were particularly well arranged; generally they were placed in two long rows, with their heads to the wall, and a division between each pair. There was a wooden feeding trough, about 1 foot in width, running along the whole length, at one end of which the distillery wash or pot-ale was admitted by a tap for the cows to drink; at the opposite end it was let off into the open gutter or manure drains at the heels of the cows, and then flowed back with the urine to the main sewer at the other end, and so into the great tank. The space allowed for standing room from the wall to the heel drain was 8 feet; the heel drain itself was 3 feet wide and 3 inches deep. There is a continuous flow from the main sewer, which takes the draining from all the cows, together with the pot-ale and water, into the large tank sufficient to fill a 2-inch pipe at least. From the tank it is pumped up to a level 80 or 90 feet higher into large wooden vats or reservoirs, from whence it flows by gravitation over the farm through 4-inch iron pipes.

In the different fields are hydrants, from which by means of iron pipes in joints about 6 feet long each, with about 30 feet of flexible canvass or india-rubber hose, and a tin distributor or jet, the liquid is shed over the fields. The farm consists of about 400 acres. There is a second farm steading about a mile from the distillery, at a lower level, where there were 100 more cows in a house, and about 260 pigs. Although no particular attention seemed to be paid to mere appearances at the distillery, the cows all looked in good health and condition, and were very tolerably clean, but it must be admitted that the smell was offensive, chiefly owing to the pot-ale. One man takes care of 50 cows, that is, he cleans and feeds them, and every 13 cows have a woman to milk them. The milk is kept in flat wooden vessels, and conveyed to the Glasgow public by means of one-horse spring carts, in neat wooden barrels with taps. The superfluous milk is made into butter by means of two large plunge churns, holding about 100 gallons each, worked by horse power. The chief part of the solid manure, which is very considerable, is disposed of by sale to the public, as much as 2000 tons in the course of the year; this at 6*s.* per ton would be no very bad rent for the land itself, something like 30*s.* Mr. Harvey's farm is held from different proprietors, and the rents vary, but the highest is only 3*l.* per acre. In the winter season the cows are fed upon the distillery grains, hay, Turnip, and Bean-meal. In summer and autumn, of course, they have the more succulent food, such as Rye-grass and Clover, Italian Rye-grass, Cabbage, &c. The Italian Rye-grass does not appear to stand the winter. It is sown early in April, and the first cutting is usually about the end of June, and it gives four cuttings in the season.

We saw the liquid applied to land in preparation for green crops, and again at a higher level on a field of seeds. The flow was very weak indeed. There were two men employed, and they did not go over one acre in the course of the day. We saw it again in operation the same day nearer to Glasgow, not far from the Cowlairs station of the Edinburgh and Glasgow railway, and in the same way with iron pipes in joints of 6 feet.

Everything was very far behind for the time of year; the herbage very bare, and the Italian Rye-grass not above ground. One month later we again visited the farm on the 24th May, and although from the unusually dry and cold season all vegetation was behindhand, the effect of the liquid was most evident. In the fields of seeds we visited a month before, the herbage was as thick as it could stand on the ground, and of the darkest green colour, but not quite long enough to cut. One part of this field is at too high an elevation for the liquid from the pipes, and the difference between the crops in the same field was extraordinary, the undulating line of the distribution was most clearly marked. Where the liquid had not been applied the crop was thin, poor, and of a yellowish brown hue. The Potatoes which were planting in April were not yet above the ground, but the drills were being harrowed down; the Cabbage seems to thrive very well upon the liquid, and large quantities are planted here for autumn use.

The kind of cow chiefly used by Mr. Harvey is the Ayrshire, but there are a good many crosses, and he had a Durham bull in one of the stalls. Rearing calves was tried, but did not succeed. The cows are kept as long as they milk well, when they are fattened on distillery grains and Bean-meal for the Glasgow butchers.

This large establishment is well worthy of a visit from all who are interested in the results of liquid manuring. The most sceptical must admit that the effect produced by the liquid is very great indeed. The question of the expenses is another point on which we are not in a position to enter minutely at present. The locality is highly favourable to the system, and Mr. Harvey's great merit is his ready perception of the fact, and turning his position to the best advantage. It has all the appearance of a thriving concern, and we trust it may long continue to remunerate him handsomely for the enterprise and sound judgment he has evinced.

(*To be continued.*)

CARLISLE MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

REPORT OF IMPLEMENTS—*Continued.*

As it is unnecessary for us to make these columns a mere catalogue of articles exhibited, we shall confine our present notices chiefly to the novelties of the show, contenting ourselves with a mere mention of such machines as have been repeatedly described in former years.

In going through the stands we selected for especial mention Richmond & Chandler's Chaff Cutters, both the prize one and that commended; their Root Washer, constructed with a rack and pinion for raising and emptying the cylinder, which though less simple than Crosskill's Archimedean, costs 26*s.* less money. Their Steaming Apparatus with a 30 gallon boiler, and a 4 bushel wrought iron pan, is very complete, and at the same time cheap.

Coulson's combined Machine for Morticing and Boring Naves, Felloes, Gates, Posts, &c., is calculated to save a great amount of time in making and mending the farmer's vehicles and gates.

Greening's Washing Machine seems rather too complicated for the farmer's wife to manage, but is exceedingly ingenious in its motions; it works a "Peggy" with an up and down and reciprocating circular motion (which will also serve for churning), and it wrings the wet clothes between rollers.

Chandler's Liquid Manure Drill with Reeves's patent improvements is simpler and cheaper than the original machine; instead of buckets to deliver the liquid, there are small holes in the bottom of the cistern, and a revolving stirrer regulates the quantity flowing out by scraping away the sediment from above the holes with greater or less rapidity.

Garrett's Prize Drills maintain their title to the Society's honours, and their Manure Distributor (Chambers's patent) is a most beautiful invention for delivering pulverised manures in small and regular quantities.

Huckvale's Turnip Thinner bids fair to become a very valuable implement; it is now made to take two rows at a time, and the draught of the single hoe is so arranged that the horse can walk on one side the plants. The price is only 7*l.*

Garrett's Root Pulper is a clever adaptation, consisting of a pair of toothed rollers added underneath a Gardner's Turnip slicer; it will crush and mince a large quantity of roots in a very little time, requiring, however, two men to turn it.

Smith and Ashby exhibit their first-rate Haymakers, Horse Rakes, and Chaffcutters; and their Cultivator is a very strong and effective implement.

Crosskill's Clodcrusher has been improved by making every alternate disc of somewhat larger diameter than the others; the discs all press on the ground together, but the larger discs having an eccentric motion as well as free play upon the axle, prevent all possibility of clogging.

Hornsby's Engines, Threshing Machines, Dressing Machines, and Drills are well known; and deservedly received their share of prizes and high commendations. Their fore-carriage steerage is certainly the best yet brought out, and is invaluable upon lands where straight and perfectly regular drilling is found indispensable, that is, where Garrett's horse-hoe or Smith's simpler implement are in use.

Bentall's Broadsharer continues the best, notwithstanding its being denied the prize on this occasion. For sticking close to its work even in the most unfavourable ground there is no known implement like it; wherever a single one has been introduced, scores more have been immediately demanded; this maker has an immense sale for them, and may be considered as a great benefactor to English agriculturists for furnishing them with a cheap as well as invaluable implement.

Bentall's new Harrows, constructed by machinery, are remarkably strong: the teeth fixed in a very firm and enduring manner; and the price very low.

Gibson's Revolving Grubber or Forker must be regarded, we fear, as a failure, after the trial to which it has been subjected; it is useless on lea ground, and we consider that the common cultivators are superior to it for stirring land already ploughed.

Fowler and Fry exhibit a very cheap iron Oil-cake Breaker, and some very excellent Root-graters, which tear into fine shreds about 1 bushel per minute; price only 3*l.* 10*s.*

Fowler's Steam Draining Engine was at work outside the Show-yard. We cannot refrain from again urging all practical men interested in land drainage to ascertain for themselves the character of this engine's performances, and to avail themselves of its extraordinary powers wherever wet lands remained to be drained, and clay farms to be improved. It completes drains at any depth, laying in the pipes in a more perfect manner than is possible by manual labour; and its cheap and expeditious work ought to recommend it constant employment, or, at least, in any locality where the pickaxe is unneeded to loosen a subsoil of rock.

Holmes & Son show a clever and very useful Manure Distributor. It has brass deliverers, which will not corrode, and a sliding (as well as a rotary) motion is given to the stirrer without any complicated system of worms and levers—this being effected simply by the side action of a wheel hung "untrue."

Nicholson's Haymaker is a great improvement. It has a reversing movement, without any intermediate pinion; and its very simple machinery is so constructed and arranged as to secure great durability and freedom from excessive wear. We believe the inventor intends to have still stronger spur wheels and pinions next year; and then, we think, this machine, for effectiveness, simplicity, easy management, light draught, freedom from clogging, and lowness of price, will be unsurpassed by any.

Nicholson's One-horse power Portable Steam Engine seems to be useful for farms where much stall feeding is carried on.

Phillips's Root Pulper, improved by the substitution of a vibrating plate for a shaking hopper, is the most efficient machine for its purpose, mincing most effectually 20 to 30 bushels per hour. Price 6*l.* 10*s.*

Stanley exhibits Cambridge's Press-wheel Roller, with patent scrapers attached, which is certainly an improvement.

William Lister shows a new implement for tailing and loosening Turnips in the ground—a sort of horse hoe, with knives passing under the rows of roots. The price is 6*l.*, and with this implement and a new form of hand hoe for topping, the inventor states that Turnips may be topped, tailed, and raised, ready for throwing into carts, at 1*s.* per acre.

Tuxford & Sons exhibit, besides their Steam Engine and Threshing Machine, a very improved Saw Table, with an adjusting spring attached to the fence plate, for taking the twist out of deals, together with several other good arrangements for facilitating the work.

Balls' Cultivator is remarkably simple; the driver raises the tines out of work by merely bearing upon the handles. The price is 6*l.*

Samuelson's Turnip Cutter is still the best for its purpose.

James Blair's Potato Riddle is a capital contrivance for sorting and dressing. It is a modification of the common corn winnowing machine. Price 3*l.* 10*s.*

Coleman's excellent Dray Harrow and Scarifier obtained the prize, and is a very efficient implement.

Lucock's Drain Tile and Pipe Machine has a clever self-acting cutting apparatus, consisting of horizontal wires strained between two endless bands of spring steel, which continually travel round riggers placed above and below the machine. All is done by a continuous rotary motion.

Palmer exhibits Patterson's new Clod Crusher, which resembles Crosskill's in appearance, only the rings have an even instead of indented periphery. Each alternate disc works eccentrically, thus insuring a good self-clearing action.

Gray's Subsoil Pulveriser is an admirable implement. Three tines are so attached to a beam that they precede each other though in different tracks—each time thus having loosened soil on one side—which facilitates working and lightens draught.

Howards' have several very admirable implements besides his first-class ploughs. Their Drill Presser first sows the seed with a zinc roller and brush, which distribute very regularly, whether going up and down hill, and then small shares follow, covering in the corn with the crests of the furrows. Their Horse-hoe, made entirely of wrought iron, is a very good tool, working with remarkable steadiness. Their Horse-rake is perhaps the best that can be had, having light and strong steel teeth, a neat and easy method of raising for delivery, and an adjustment of the shafts by which the accumulation of soil and rubbish may be prevented.

On Ransomes & Sims' long stand, in addition to the prize ploughs, the chief objects of interest were Cotgreave's Subsoil and Trenching Plough, Lord Beauclerk's Archimedean Subsoiler, in which a horizontal revolving screw follows in the loosened soil behind a tine or subsoiling coulter; Biddell's Bean

Cutter and the Steel Oat Mill, which has steel blades cast in an iron barrel.

Not the least interesting of the stands was that of Messrs. Gibbs & Co., which contained an immense variety of samples and specimens of Grasses, natural and artificial, grains, roots, &c. The extraordinary perfection of the dressing and cleaning of the seeds excited general admiration; and, indeed, the cleanliness and trueness of the samples is the more remarkable from the fact that instead of being got up merely to show how seeds can be made to look, they are all taken from the bulk of Messrs. Gibbs' stock, and are precisely of the same quality which they supply to customers.

REPORT OF CATTLE—*Continued.*

HEREFORDS.

Class 1. Bulls calved previously to the 1st July, 1853, and not exceeding 4 years old.—The first prize was awarded to No. 105, the Right Hon. Lord Berwick's bull. This is a truly noble animal, of great weight and beauty; we have not his superior in the yard. He is tall, and of excellent form and symmetry, almost equal to the heifers of his breed shown in subsequent classes; his colour is red, with white face; he is 2 years, 9 months, 26 days old, and is called "Altringham," and bred by Lord Berwick. To begin with him as he stood before us—his frame is long, rotund, and deep; his ribs, thighs, tuts, twist, and flank exceedingly good; loin, chine, and back level and broad, and well covered; his girth very large, head handsome, neck full, and well set to chine and shoulder, which are well out and of full form; his hand and coat good, and offal fine. No other in his class comes near him. No. 102, the Earl of Radnor's bull, receives the second prize. He is a well made animal, and his form excellent, being rather oval than round; his fore-quarters are very good, but his hind-quarters are defective; he is not large, but good in quality of flesh. No. 99, Mr. W. S. Powell's bull, was highly commended. His hips and rump are not well formed, twist superior and well out, thighs long and full, chest and chine good and deep, ribs not out enough, but of great length, forming a deep frame. No. 103, Mr. R. Hill's bull, was highly commended. He is a well made animal, heavy, and of deep form. No. 106, Mr. Monkhouse's bull, was highly commended. He is not very large, but is of very good form, and of superior quality in flesh.

Class 2. Bulls calved since 1st July, 1853, and more than 1 year old.—No. 109, also the property of Lord Berwick, received the first prize. He is of good and regular form, and his quality of flesh exceedingly good; he has broad even hips, and wide good rump, flanks full, rather short bosom, good girth, chine fair, ribs deep, and not sufficiently out from ribs. No. 110, Mr. J. Monkhouse's bull, receives the second prize. His hips and rump are wide and good, and flank fair, but his ribs are not round enough, nor is his girth large, his form pretty good.

Class 3. Bull-calf above 6 and under 12 months old.—The prize of 5*l.* was awarded to No. 112, the property of Mr. E. Williams. He is a very handsome calf, of much promise, very good fore-quarters. This class was well sustained, though the animals were few.

Class 4. Cows in milk or in calf.—The first prize was awarded to No. 122, the property of Mr. J. Monkhouse. This is a large, good animal, her hips very ponderous, tuts very large, her loin rather defective, ribs fairly out, chine and girth deep, and shoulder well out, bosom full, her frame large and well proportioned. Second prize was given to No. 121, Mr. J. Turner's cow. She is a very handsome good animal, exceedingly good frame, and excellent in quality of flesh. Her points admirably developed. No. 118, Mr. James Acker's cow, was commended—this she richly deserved. She is of good frame, with full hips, fat tuts and twist, shoulder and chine good, thighs rather thin; she is very fat, and a compact and large made cow, suckling a precious thin calf.

Class 5. Heifers in milk, or the calf not exceeding 3 years old.—The first prize in this class was given to No. 124, Mr. J. Walker's heifer. She has large tuts and great hips, beautiful form, stands wide; a good representative of the breed. The second prize was given to No. 123, Mr. W. Perry's heifer. This is a very creditable animal, prettily formed, rather too slender in general frame, but of beautiful quality, and betokens good milking properties.

Class 6. Yearling heifers.—The first prize is given to No. 128, Lord Berwick's heifer. She has a very compact, symmetrical form, her whole outline and points good, without any being particularly noticeable. The second prize is given to No. 125, Mr. W. Mayberry's heifer. She is a truly handsome specimen of the breed, well formed throughout; her lower parts very good (*i. e.*, flank, plaits, breast, twist), all good; head rather large for her size.

DEVONS.

Class 1. Bulls calved previously to July 1st, 1853, and not exceeding 4 years old.—The first prize was given to No. 134, Mr. John Quantly's bull. He is exceedingly well formed, most compactly filled out, and of prime quality; his hips, like most of his breed, are too narrow, as are his flank and repping parts; his head and looks very good. The second prize is given to No. 133, also Mr. Quantly's bull. He has very level complete frame, beautifully proportioned where good, and short deep ribs, not quite enough out; his tail is low, and twist full. No. 132, Mr. Farthing's bull, was commended. His peculiarity was an immense twist, almost disfiguring his thigh; his form is very deep, and good in proportion; his flank first rate, and superior in quality.

Class 2. Bulls calved since July 1st, 1853, and more than 1 year old.—The first prize was given to No. 135, Mr. G. Turner's bull. He is an admirable specimen of the Devon breed—most symmetrical in frame, and his quality of meat very superior; his only fault, like all the breed, too narrow hips. The second prize was given to No. 136, Mr. W. Farthing's bull. He is not of perfect form; his shoulder is out of proportion; chine and girth defective; his frame is deep and long.

Class 3. Bull calf above 6 and under 12 months old.—The prize was given to No. 137, Mr. G. Turner's bull calf. This is a very complete and beautifully formed little fellow, denoting most of the best points in his breed.

Class 4. Cows in milk or in calf.—The first prize was given to No. 141, Mr. G. Turner's cow. She is a very complete animal, so uniformly good in all essential points except her hips, which are as usual too narrow; but her loin is very good, and ribs well thrown out; her great fault is her size, she is too small, quality perfect. The second prize was given to No. 140, also Mr. G. Turner's cow. She is not so perfect as her competitor, but has a good deep frame, of excellent proportions; her chine is somewhat too narrow, and sides a little too flat. No. 142, Mr. W. Farthing's cow, was highly commended; she has a better hind quarter, having wide hips and good tuts, her tail stands well.

Class 5. Heifers in milk or in calf.—The first prize was awarded to No. 146, Mr. J. Quartley's heifer. She is small, but of almost perfect form and quality of flesh, very compact and proportionate in all parts. The second prize was awarded to No. 144, Mr. G. Turner's heifer. She is also small but beautifully formed; her twist not so good as No. 146, but her quality of flesh quite equal. No. 145, Mr. W. Farthing's heifer, was highly commended. This is a large heifer, of good substance, roomy and well formed, but not equal in quality of her meaty parts to the preceding. No. 147, Mr. T. Webster's heiter, was highly commended. This heifer has a large and roomy frame for the breed, but common in appearance and not equal in quality. This was a good class.

Class 6. Yearling heifers.—The first prize was awarded to No. 152, Mr. J. Quartley's heifer. This is a very handsome and compactly formed heifer, of perfect symmetry and fine proportions; her outline so even as to leave no point for especial notice except in praise. The second prize was awarded to No. 151, also Mr. J. Quantley's heiter. This has also a beautifully formed frame of deep proportions. She is not so well and evenly filled up in all her points as 152; her tail is too high and tuts short. No. 153, Mr. F. Wilken's heifer, was commended; she denotes a larger frame and more lean flesh and substance.

AYRSHIRES.

Class 1. Bulls of any age.—The prize was given to No. 154, Mr. John Stewart's bull. He is a very useful young bull, straight back, chine narrow, and ribs flat, good flank, and deep chest. His character stands high in his class, having already taken forty prizes in his own country.

Class 2. Yearling bulls.—The prize was given to No. 156, Mr. John Stewart's bull. This is a very small and by no means a good specimen of the breed. We asked ourselves if the Judges had done right in this class.

Class 3. Cow of any age.—The prize was given to No. 163, Mr. W. Muir's cow. She is a slight formed little animal with level back, and denotes fair milking qualities.

Class 4. In calf heifer.—The prize was given to No. 164, Mr. J. Stewart's heifer; she has a fair frame but small and profitable looking. No. 165 was commended—she has a rather better frame, but don't look so profitable.

ANGUS AND OTHER POLLED BREEDS.

Class 1. Bull of any age.—The prize was given to No. 166, Mr. M'Combie's bull. This is a large and long-framed bull, deep and heavily formed throughout; he has a good tut, flank, and twist; hips not wide, but an even straight back, chine and shoulders well formed, and very deep through. A good and profitable animal.

Class 2. Yearling bull.—No competition.

Class 3. Cow of any age.—The prize was given to No. 168, Mr. M'Combie's cow. She has full-formed hips and long rump; her hind quarters are good, and her frame is deeply formed, but ribs not out enough, and girth defective.

Class 4 In calf heifer.—The prize was given to Mr. M'Combie's heifer. She is one of the best of her breed, having a capital hind quarter, good tuts, hips fair, long and full rump, shoulders well out, chine rather sharp, girth fair.

HIGHLAND AND OTHER BREEDS.

Class 1. Bull of any age.—No competition.

Class 2. Yearling bull.—The prize was given to No. 171, Mr. Neil Malcolm's bull. He has a fair form, and possesses other useful points, but not a good animal.

Class 3. Cow of any age.—The prize was given to No. 172, Mr. Neil Malcolm's cow. She is a fairly formed poor cow, nothing more.

Class 4. In calved heifers.—No competition.

SPECIAL PRIZES GIVEN BY G. HEAD HEAD, ESQ.

GALLOWAY CATTLE.

Class 1. Bulls not more than 4 years old on 1st July, 1855.—The first prize was given to No. 745, Mr. J. Graham's bull. This is a good animal; his hips and loin are not wide, and his sides are too flat, but he has capital thighs and under parts, his rump good, a deep chest and full large shoulders, and very deep frame. The 2d prize was given to No. 746, Mr. J. Carruther's bull. This is a very heavy weighing animal, denoting an unusual amount of lean flesh; his sides too flat, as are those of all the breed, but he is very deep through; his frame rather too long, and not quite even back; hips too close, and tail high; neck too high. No. 744, Mr. J. Sutton's bull, was commended. He has a deeply formed frame; his ribs too close, making long flat sides; a heavily formed animal with much good lean meat; tail high and rump prominent.

Class 2. Bulls calved since 1st July, 1853, and more than one year old.—The first prize was given to No. 751, Mr. James Beattie's bull. He is more compact than his breed generally, has good shoulders well out, a level and rather broad back with deep thighs and good flank. The second prize was given to No. 756, Mr. J. Borrell's bull; this is also a compact well formed animal, and rather shorter than is usual in the breed, but his sides are like the class, flat and deep, hips too close, but he denotes many useful points.

Class 3. Cows in milk or in calf.—The first prize was given to No. 761, Mr. James Beattie's cow; this is a very good poor Galloway cow, and her frame though poor is equal to any in her class, while her general characteristics are superior. The second prize was given to No. 770, Mr. J. Grainger's cow; this is a smaller animal, but very compact and well formed, her sides not so flat as many others, rather low hips and her udder is long; she has a good chine and level back.

Class 4. Pairs of heifers in calf or milk, and not exceeding 3 years old.—The first prize was given to No. 781, Mr. G. Reddick's heifers. They are two very well matched and good heifers; the smaller one of excellent qualities for fatting and in good form. The second prize was given to No. 779, Mr. J. Pearson's heifer. They are a pair of very compactly framed animals, form rather long in proportion, and denote much lean flesh of good quality.

The Galloway Cattle Classes formed an interesting feature in the exhibition, particularly to Southerners, and they were well and very well creditably represented.

Home Correspondence.

Fingers and Toes.—I have about 3 acres of Turnips in one field, a sandy soil, sown at different times, and all are infected with the disease called fingers and toes, or anbury (*unde deriv.* ?). Even the last sown are infected, a specimen of which I have enclosed. [It did not reach us.] In those sown six weeks or two months back (both white and Swedes) the excrescences, many of them, have a small maggot or small black creeping insect inside them—are these the cause or consequence of the disease? If the cause, how is it that the young plant is diseased before it has attained a size large enough to hold the maggot? It is the first year of my having this particular field; I remember three or four years back seeing in it a capital crop of Turnips, but that season was a good deal drier than this. What is the remedy for the future? and what the cause of the disease? and will the crop this year be useless, at least those Turnips which are diseased, which constitute two-thirds of the whole? *Amateur.* [Try marling or liming; and sow Rape instead of Turnips now.]

Dairy Statistics.—Feeling interested in the "Dairy Statistics" recently published in the *Agricultural Gazette*, I send you the result of one week's experience in my dairy. The milk of two cows has been carefully measured, and 8 quarts of milk have yielded 1 quart of cream, which when churned produced 15¼ oz. of butter to each quart of cream. One cow was an Alderney, which calved in May of her first calf; the other cow, an animal of the common Yorkshire breed, calved about five months ago. These cows are part of a dairy of seven, which, with other stock, have the range of a pasture of about 15 acres of fair average Grass land, meadowed last year, and deep-drained the autumn before last. The cows were turned out late in May. The farm on which the above yield has been obtained lies under the Cleveland hills, in the North Riding of Yorkshire. Cheese is usually made on the neighbouring farms during the summer months. *D. M.*

Gardens for Schools.—Reading an article in the *Gazette* for August 11 upon this subject, I beg to communicate a few facts respecting a school of this kind I visited on the 3d inst. I had been apprised of a cricket match, horticultural show, and tea party to be held in the schools on the above day, and accordingly repaired early to the scene of action—a quiet village in the county of Surrey. The country here is remarkably flat and densely wooded, but I was soon able to distinguish where lay the object of my search by observing the Union Jack flying from the top of a lofty pole (the climbing pole in the play-ground). The joyous shouts of the boys in an adjoining field attracted my attention for a time in their contest at cricket, but I soon began to look for the "horticultural show." This, I was informed, was not open till 3 o'clock, so I amused myself by strolling about the grounds and buildings, &c. The extent of these grounds is upwards of 5 acres, a part of this being exclusively devoted to gardening purposes. Here the boys are instructed for an hour and a half daily in the practice of spade husbandry. I observed on the field garden very promising crops of Barley, Potatoes, Mangold Wurzel, Cabbage, Italian Rye-grass, and Turnips, which certainly show what little hands can do when well directed. The workers in this case, however, are none of them of the class mentioned by J. C. Morton, but are chiefly resident scholars, paying at the rate of 16*l.* per annum, receiving in addition to the instruction I have named the usual elementary education of other schools. As a means of interesting and useful pastime, each boy is allowed an allotment of 30 to 100 square yards, the produce of which, after defraying expenses, belongs to the occupier. I should have spent more time in investigating these matters had not 3 o'clock invited me to the show tent. Here I found nicely arranged various vegetables, flowers, and fruit for competition for prizes; the collection on one side being from the cottagers, and on the other from the boys' allotment gardens as mentioned above. The judges had some difficulty in deciding in several cases, but concluded about 4 o'clock, when all sat down to a plain tea provided at a charge of 2*d.* After tea the prizes were distributed as below:—

1. Parsnips	Lee	...	2*s.* 6*d.*
2. Onions	Tanner	...	2 0
3. Wheat	Faithful	...	1 6
4. Broad and French Beans	Sink	...	1 0
5. Peas	Bixley	...	1 0
6. Potatoes	Sink	...	1 0
7. Bunch of flowers	Fuller	...	1 0
8. Apples	Baker	...	1 0

BOYS (from allotments).

2. Ditto	Spenser	" 14	2 0
3. Mangold	T. Symonds	" 11	1 6
4. Beans	E. Symonds	" 15	1 6
5. Onions	"		1 0

FOR THE BEST CULTIVATED ALLOTMENT.

James Elliott	Aged 15	2*s.* 6*d.*
Thomas Hanson	" 13	2 0
John Fowler	" 13	1 6

That such institutions and exhibitions as these are productive of much good there cannot be a doubt, and I think the day will come when nearly every parish will be able to boast of its school of industrial training. By this means a more intelligent race of labourers will spring up capable of keeping pace with the many new appliances to modern farming. As a word of encouragement to those who may be desirous of making an experiment in this way, I may add that I was informed the school was entirely self-supporting. How such a school may be started in the best way I am not in possession of sufficient facts to advise, though I have no doubt those persevering ladies, the managers of this school, with their usual kindness, will but be too glad to do so, for no one could, I am confident, be more zealous than they for the spread of a system, which under them is making rapid strides towards perfection—a zeal which on the 3d seemed truly appreciated in the deafening cheers which followed hurrah for the Miss —'s schools. *J. J., Ockham, Ripley, Surrey.*

Crops in Hants.—I must trouble you to alter my report of the crops. Our Wheat in this neighbourhood is very bad; all suddenly ripe from blight, and much of it will not be more than half a crop of "chicken meat," small, thin corn; our reapers look more like ruddle men after their day's work than reapers. Our Potatoes are all cut down, and in a short time there will be no sign of greens left; the roots are beginning to rot. The weather is splendid—all that we can wish. *James Eames, Lymington.*

Best Mode of Cultivating Potatoes.—I have read with some interest the notice of Mr. Charles Hicks's "best mode of cultivating Potatoes," in a late *Agricultural Gazette.* The only novelty, however, I saw in the extract consisted in the following:—"There is, however, one evil attending this mode of covering, for the horse in walking either treads upon or displaces many of the sets; but I do not well know how this difficulty is to be obviated." I will, with your permission, now tell Mr. Hicks how he can obviate this difficulty, thus: Let him get a good Irish ploughman, accustomed as all good Irish ploughmen are, to drill, as we call it, but to ridge, as Mr. Hicks calls such Potato planting. But should it be inconvenient to him to get such a ploughman as I recommend, let him try his hand in training in one of his juvenile neighbours, thus: let the horse in covering the tubers walk on the top of the ridgelet or space between the drills. If he works a double mouldboard, as it is presumed he, like a good farmer, does, after the first "bout" he will with each succeeding one finish a drill or ridgelet. Should he use two horses, as most extensive Potato cultivators do, let what we call in Ireland his "large swing," and in England I believe "long-whippletree," be so long as that each end of it when in

use will nearly reach the tops of the first and third drills or ridgelets, the plough will then "split" the second. In returning let the inner left hand, or leading horse, walk in the space thus cleared by the plough, and the off-hand horse walk on the top of the fourth drill or ridgelet, and so on till the work is done, returning finally to the half-round drill, the first done. If he uses a single mould-board plough the same rule will hold, but varying a little because of the double space travelled by the horse or horses. I hope I have made myself sufficiently understood to enable Mr. Hicks to get over his difficulty. If not, and that the matter is of sufficient importance to him, let him come or send over his ploughman to me next spring, and he shall be taught the simple practice "with a ceadth millhe failthe." *Edward Carrell, Cranemore House, Clonegal.*

Steam Cultivation.—By referring to my last letter p. 459, the readers of the *Gazette* will see I affirmed the grand condition to be fulfilled by a steam-cultivating machine was, that it should do more work in less time, and for less money, than is now done by the plough, &c.; and they will further notice, that after investigation the fulfilment of that condition appeared to resolve itself into this simple proposition, viz., by what figure or method is it possible to move a heavy body like a steam-engine over a superficies, so as to overcome the greatest possible amount of work by the least expenditure of time and power! Now there may be many farmers who do not know the value or nature of reasoning by induction. Hence, for their information, I may tell them it goes before experience, and is the guide of it, and that all the "science" of the philosopher differs only in degree from that source of information which is the fruit of the commonest experience. The foundation lies in our expecting that similar effects or results are sure to arise from similar causes. Lord Bacon in defining the value and conduct of the method, lays down the following as a fundamental aphorism:—"Man, the servant and interpreter of nature, can only understand and act in proportion as he observes or contemplates the order of nature; more he can neither know nor do." Nature stands ever ready to minister to our wants and furnish us with the examples we need, if we have but the sagacity to separate the essential points from the cloud of perplexing circumstances with which they are generally surrounded. Let us see whether we can apply these principles to the useful subject we have in hand, viz., how to introduce the steam-engine to tillage purposes. The "conditions" to fulfil may be restated in these two propositions: 1st. To move a great weight, such as a steam-engine, with the least expenditure of power, over arable land; 2d. How to cause the definite amount of power possessed by such engine to operate upon such arable land with the greatest economy of time, power and expense. Let us see how Nature operates when she has a heavy weight to move and yet desires to execute as much work as possible in a limited time. We will select as examples a cow grazing, a sheep feeding, a hawk hunting, a man broadcasting, or tethering a horse. We will not stop to inquire whether these several illustrations are prompted to operate as they may do by instinct or by reason; it will be sufficient for our purpose to discover what conditions they fulfil by the *modus operandi* they pursue, and then seek to apply it to the useful purpose we have in view. The first example is that of the cow. Now, a cow has a heavy body, and she is desirous of filling her stomach with the least exertion, and in the least possible time execute the greatest amount of her work, viz., grazing. How does she behave? The gate is opened. She rushes into the field and begins to eat the Grass. Do you observe how she manages that sort of work? She does not advance in a straight line, eating a narrow ribbon of Grass right across the field; but stands nearly in one spot, advancing a foot now and foot then at very slow intervals of time; but mark in what manner and how quickly she directs her mouth, swaying it from side to side in the form of a semicircle; in fact she shows a decided tendency to devour the Grass all around her before she moves her heavy body an inch. The same with the sheep; and now observe that hawk. He is out beating and exploring certain fields for his prey; how does he proceed? does he fly "right ahead," like a crow? No. What is it then which prompts him to describe so many circles—now one, then another—over that 10 acre field? The answer is simply this, that by the method he pursues, whilst he moves his body the least distance he executes his work (searching) over the greatest amount of superficies or surface. It is instinct that prompts him, of course; but still it is evident to us if he were to fly "right ahead," like a crow, he would go, or carry his body a long distance, it is true, yet see very little of the country; hence as such an "up-and-down-field" course of proceeding would be inconsistent with time and economy in labour, Nature has prompted him to circumgyrate one spot (whose area contains as much surface as would have taken his heavy body many linear miles to traverse. Performing his revolutions around a 10-acre field, his vision radiating to the centre, he can see in a few moments every living speck contained in such field. Here is economy of time and power by means of right "method." I will only adduce another example, and that shall be "man." Have you watched a labourer in the act of broadcasting? his aim is to distribute seeds or manure over the greatest amount of surface, with the least fatigue and in the least possible time. He is left to himself. How does he proceed? Does he take the seeds, and rapidly advancing, jerk them in a straight line before him! No; he does nothing of the sort; his instinct (I must have it "instinct" here) readily informs him such a *modus operandi* as that would not fulfil the conditions he has before him; so observe him—he dips his hand in the seedlip, advances a step, stands still, and casts the seeds from his hand in the form of a semi-circle: again his foot advances, his body stops, his hand describes a semicircle, and he has found out this mode of operating fulfils the conditions required—viz., that of carrying his heavy body the least possible distance whilst his hands perform work over the greatest practicable area, thus economising time and power. Again, who instructed man to tether a horse? The object here is to provide the animal with as much food as possible in the least time, &c. To fulfil the conditions would a man fix down a peg at A, and from it stretch a rope 2420 yards in length to another peg at B, causing the

A ———————————————— B

horse to feed up and down such fixed rope? No. How then does man—even a savage—contrive to fulfil the conditions required! Why, as is well known (but not noticed) he takes a short piece of line, a few yards in length, fastens one end to a peg, which he knocks into the ground at A, and the other end he attaches to the horse's foreleg at B; the horse, with this short bit of line as his radius, is now able to describe a great circle, and the man quickly discerns he thereby fulfils all the conditions required; and I believe any farmer of even the most moderate "happytite"* will see that if the horse's mouth were but as long as the line, he could be made to bite up a tremendous surface of Grass in a very short time, and yet not have to carry his heavy body very far to do it. Now, we want to cultivate land by a heavy body called a steam tillage machine; what profitable deduction can we make from the above natural illustrations! Why, backed by their scrutiny and further supported by our knowledge of the particular method Nature invariably pursues in all her vegetable and physical labours—from a Turnip to a tree, or a small stone to the great globe itself—I advance the following conclusion, viz., that she always includes the work to be done within the area of a "*circle*," as this particular figure enables her to fulfil the condition of doing most work with the least expenditure of time, power, and material (money). Hence, what is the course we should pursue in respect to the tilling of the land by the agency of steam? Why, that we also should include the work to be done by a heavy body like a steam-engine within the area of a "*circle*;" and in my next letter I will explain how this can be done without leading to any "neutralising disadvantages" in relation to our present farm economics. *Chas. Burcham, London.*

Fences.—In a recent Number of your Paper there is a communication signed "A Northern," in which it is stated "that nearly all the Thorn hedges one sees are clipped square, &c." As this is expressed one has difficulty in getting at the true meaning. It may happen that the writer spends most of his time in some small town or village, where the only hedges he sees bound gardens or paddocks, and where the fences are clipped into the shape he describes, for the purpose of bleaching or drying clothes upon. If this is what is intended to be expressed, it is very likely true, and I have nothing to remark upon it. If, however, it is meant to state that the writer is extensively acquainted with the district his name denotes, and that he wishes it to be understood that the practice of square clipping he describes is general in that district, I beg most positively to deny the allegation. You are tolerably well acquainted with this district yourself, and know I am justified in affirming that in the north of England are many farms and some whole estates where the fences are second to none. It is true there are many bad and neglected fences in this as in every district, but their inefficiency most certainly does not arise from their having been treated as your correspondent describes. *Another Northern.*

Farmers' Clubs.

READING. — *Guano and Superphosphate as Specific Manures.*—This subject was introduced at the last monthly meeting. Farm-yard manure contains all the ingredients requisite for the different crops we cultivate, but unfortunately we cannot, or do not, obtain it in sufficient quantities, and therefore we have recourse to guano and superphosphate to make up the deficiency. But how, in many cases, are these expensive adjuncts used on the farm? I have known men, when their dung has run short for Wheat, apply superphosphate as a substitute; and I have known others use Peruvian guano for Turnips, when phosphates with but little ammonia would have produced them better crops. In such cases there is money lost both to the producer and the consumer, because the maxim of growing the greatest possible amount of food at the lowest possible expense is totally reversed. If you saw a man feeding his pigs on hay and his bullocks on wash, you would say he was acting absurdly; but, in my opinion, not more so than he who gives his corn crops phosphorus and his root crops nitrogen. After nearly 18 years' experience, I have found one thing is pretty certain, and that is, Wheat requires nitrogen. You might as well ask your shoemaker to make a pair of shoes from a yard of calico, or any other absurd thing, as to ask of dame Nature to give you a crop of Wheat, while you supply her with materials suitable only for a crop of straw. I have seen farms produce heavy crops of straw and light crops of Wheat, when, if there had been less carbon and more nitrogen in the soil, the result would have been very different. Nature explains to us most emphatically, that "what a man sows that shall he also reap." Wheat contains gluten, and this gluten is produced by nitrogen, and therefore nitrogen in sufficient quantity must be present in the soil, or we shall fail to reap a full crop of corn, however good and heavy our crop of straw might be. When I make a statement I like to give a reason for doing so. Look for a moment at the analysis of Wheat—the Flour of Wheat. In 100 lbs. of flour there are 50 lbs. starch and 10 lbs. gluten. I need not mention the other ingredients, as they are unimportant to this inquiry. The starch is composed of carbon and water (36 lbs. carbon and 45 lbs. water, making 81 lbs. of starch), and this can be obtained by the decomposition of vegetable matter, found in farm-yard manure generally in sufficient quantities. The gluten (the part most difficult to supply), is composed of nitrogen, *i. e.*, nitrogen is essential to its production in the flour of Wheat; and if nitrogen be wanting in the soil, there can, of course, be no gluten formed, and consequently no Wheat. In farm-yard manure, however, there is nitrogen, though in most cases so deficient in quantity, that the production of a full crop of corn may not be reasonably expected; and this is the time when the farmer requires assistance in the shape of some specific manure which will give him a full supply of this fertilising gas. Now, if I have satisfied you that the specific for Wheat is nitrogen, then the question arises, how is it to be obtained at the cheapest rate! Let us refer for a moment to the prices of some fertilizers usually recommended to supply nitrogen. Carbonate of ammonia supplies, at its present commercial value, ammonia at 1*s.* 6*d.* per lb. (It should be observed here that nitrogen is taken up by plants in the shape of ammonia—14 lbs. nitrogen and 3 lbs. hydrogen making 17 lbs. of ammonia.) Sulphate of ammonia contains 14 per cent. of the gas in question, and at its present value (18*l.* per ton), yields ammonia at about 1*s.* 3*d.* per lb.; muriate of ammonia produces it at 8*d.* per lb.; soot about the same price, and shoddy perhaps rather higher than 8*d.*; but in the best Peruvian guano I find an article which yields ammonia at a little over 6*d.* per lb., *i. e.*, supposing it to cost 12*l.* per ton, which is now, I think, about its market value. The reason that Wheat almost invariably produces a fair crop after Clover, Beans, Rape, &c., is owing to the fact that these vegetables are all collectors and depositors of ammonia, and therefore the natural precursors of Wheat in the usual routine of farming. The heavier your crop of Clover the more nitrogen will be accumulated and laid up for your future crop of Wheat; the practice therefore now prevalent of puttin: dung on the young Clover must be a good one. I will now give you the particulars of an experiment tried on a piece of land exhausted for the purpose, which, I think, will show that ammonia is a specific for Wheat, and that superphosphate is of little use to it. The first portion, without manure, gave a produce of 16¾ bushels per acre; the second, with 700 lbs. superphosphate, 16¾ bushels; third, with 14 loads dung, 22 bushels; fourth, with superphosphate as above, and a portion of sulphate of ammonia, 26¼ bushels. I think, as the 700 lbs. superphosphate evidently did no good, the amount of produce being the same (16¾ bushels) as that on the unmanured land, and that, as in the fourth case, the produce at once rose by the application of ammonia to 26¼ bushels, there can be no doubt that the presence of nitrogen in the soil is not only necessary, but that an ample supply must be found there, before you can reasonably expect a full crop of Wheat. The experiment showed also that superphosphate did no good in that instance. As I at first stated, Wheat requires nitrogen, and generally to a greater extent than farmers, from the size and quality of their manure heaps, can afford. I have also stated that Peruvian guano is rich in this gas, producing ammonia at a little over 6*d.* per lb. the lowest price at which it can be obtained in the market. I usually apply it as a top dressing, in the month of February; but in clay lands it should, I think, be drilled in at seed time. I have stated that Peruvian guano is a specific for Wheat, and now I shall attempt to prove that superphosphate is the best manure for Turnips. In doing this, I shall confine myself to the results of experiments only, made by myself and others. In the year 1851 I made an experiment in a field of 5 acres, which was exhausted of its fertility, and therefore suitable for the purpose. The first portion was drilled without manure; second, with ashes only; third, with ashes and 4 cwt. ammoniated peat; fourth, with 3 cwt. ammoniated peat and 1 cwt. dissolved bones. Where no manure was used, the crop was very bad, not worth standing, in fact. The ashes produced a small crop, say about 5 tons per acre. The ammoniated peat, with ashes, was much better; but in that portion where the dissolved bones were used with ammoniated peat, the difference was remarkable indeed, producing at least 20 tons per acre. I regret that I did not have the different lots accurately weighed, as it would have proved very strongly the superiority of superphosphate as a specific manure for Turnips. It should be remarked that experiments of this kind are not of much value unless made in exhausted soils, as land in a fair ordinary state of cultivation

* "Talpa."

would with a favourable season produce tolerable crops perhaps without much assistance from specific fertilizers. The next is an experiment made by the Yorkshire Society on an exhausted clay soil.

	Tons.	Cwt.
1st, natural produce	1	6
2d, with 12 tons dung	12	0
3d, „ 2 cwt. guano	4	6
4th, „ 2 cwt. coprolites	11	8

Coprolites (natural phosphates) contain about 55 per cent. of bone earth. This experiment proves that, in a poor clay soil, superphosphate would produce for 10*s*. nearly three times the weight of Turnips that would result from an application of guano costing 20*s*. As far, however, as my own experience goes, I would recommend that a portion—say one third guano—should be used with dissolved bones for Turnip culture on heavy soils, as it causes a more rapid action of the manure, which is desirable in cold lands. Another experiment showed that 10 loads of dung, with 2 cwt. superphosphate, produced a heavier crop than 30 loads without superphosphate; and in another instance, where a field was equally dunged all over, showed that 2 cwt. superphosphate (a part being manured with it for the purpose of testing its efficacy) gave an increase of 5 tons weight in bulb over the rest of the field where no specific manure was used. I could relate many similar cases, but I think enough has been said to prove that phosphorus is the specific for Turnips. As many are in the habit of using guano for Turnips, in preference to superphosphate, I would mention an experiment that was made, the result of which showed that its addition to the dung caused the Turnips to grow more rankly, but gave a less weight of bulb per acre, than dung alone—a result just contrary to the one above mentioned, where the addition of superphosphate gave an increase of 5 tons of Turnips per acre. Superphosphate is admirably adapted to the growth of Turnips in their first stages of vegetation. It is like milk to the young animal, pushing the plant forward at a time when its infant system could not possibly derive sustenance from rougher or less suitable food. Guano is too pungent, too strong for this delicate office, and not calculated to take the place of superphosphate, as food for the young Turnip. The superphosphate I refer to is that made entirely from bones dissolved in sulphuric acid, and the mode of producing it is very simple. I have made a great many tons for my own use, and for other parties; and the mode I have adopted is as follows:—To 100 lbs. fine bone dust put 30 lbs. best white acid and 30 lbs. water; in making it, place a portion of the bone dust in a tub or trough, then add water, then sulphuric acid. Do this alternately, until your vessel is full; the whole may then remain until cold, when it is fit for use.

Calendar of Operations.

AUGUST.

West Sussex, *August* 21.—We have now got well into harvest, and have had 10 days of such weather for it as must have pleased us all. Those of us who began about the 9th or 10th, as some did, have got nearly all secured; but it is this week which is the most important for securing it. Wheat cutting may be said to have been general about the 15th, on the early low coast land, and it is about commencing on the higher land now. The appearance is good upon the ground, but the sample is not anything like last year. In every field there is more or less blight, especially where it is laid. And it will not yield according to appearance, but still it will be an average crop, and it has not suffered so much from being low as we might have expected; with Barley this is especially the case—it is good, and the young Clover in it is all that could be desired. But of course so much yet depends upon the weather that any estimate as to the quality is premature. The barometer has been tending downward since the 17th, but that may only be caused by the present high wind. Since I wrote last the Potato disease has shown itself in a manner not to be mistaken; it is worse than it has been for several years. It came I believe about the 9th, as it was noticed first on the 10th, and on the 17th we found the first Potatoes affected by it, and now nearly one-half are found unfit for use. In the gardens I have seen black Currants affected at the same time and in the same manner, and also the leaves of the Hollyhock. The general appearance of the Turnip crop is good, but I have found some Swedes rotting on the crown of the bulb, and the leaves drop off with a touch; but such seems only the case in spots, and that may only be caused by the nature of the land or the manure, which was partly dung from a town. Pasture is abundant, and lean stock are in demand. New corn will be in the market soon, as the steamers are already engaged to thresh it. But I do not think it will be pushed in so fast as last year, as many found then that they were too rash, and everything tends to induce them to take more time this year. *G. S.*

Notices to Correspondents.

Egyptian Wheat: *Anon.* It is very productive of a coarse sample. Yours are very fine ears; and if there are plenty of them the crop will be very valuable per acre, though not worth so much per bushel as other kinds.

Farm Pupils: *W H S.* They usually pay from 100*l*. to 150*l*. a year; in the latter case, unusual advantages are to be expected.

Small Carts: *D.* We have received the following in reply to yours:—"In answer to your correspondent 'D.,' who inquires where the light carts were built that he saw passing through London on their way to the Crimea, I should think it most probable that they were manufactured at the Beverley Iron-works, as I have lately supplied the Government with between 600 and 700 carts, and above 400 waggons, and they are all taken through London from the King's Cross Railway station to Woolwich. *A. Crosskill.*

Yester Deep Land Culture: *J H.*—The work describes the very successful cultivation of untoward and unpromising soils, in an unfavourable climate. The principles so energetically developed there ought to be generally known and admitted, though their application must vary in different districts.

Erratum.—For "under an average," in the case of the Barley Crop as reported by Mr. Welton, from Wickham Market, read "Good, but much laid by recent storms; for malting purposes under an average."

MAPPIN'S PRUNING KNIVES IN EVERY VARIETY,
Warranted Good by the Makers.

JOSEPH MAPPIN and BROTHERS, Queen's Cutlery Works, Sheffield; and 37, Moorgate Street, London.
Drawings forwarded by post.

REAPING MACHINE.
WILLIAM DRAY and CO.'S Book of Testimonials from purchasers of their Patent Reaping Machines, also a List of Prizes, and full description will be forwarded, post free, on application to
Wm. Dray & Co., Swan Lane, Upper Thames Street, London.

SCYTHES.—Boyd's Patent Self-Adjusting Scythes may be had of the Manufacturers, William Dray & Co., Swan Lane, London, and of all Ironmongers and Seedsmen.
A liberal allowance to the trade.

THE HYDRAULIC RAM will raise water, without manual labour, to any height, where a small fall can be obtained.
PARSEY'S PATENT REVOLVING PUMP lifts three times the quantity of water with the same labour, than any other Pump.
Fire, Garden, Deep Well, Liquid Manure, and all other Pumps.
Fountains of every description erected; Rockwork, Grottoes, &c.
Hose Pipe of every kind for watering Gardens.
W. F. Roe (late Freeman Roe), Hydraulic Engineer, 70, Strand, London.

OAT-CRUSHING and BEAN-SPLITTING MILL
(Turner's No. 5).

This Mill is recommended to the use of every person keeping a Horse, as superior for efficiency, durability, and ease in working to any manufactured. Two bshls. of crushed corn afford more nourishment both to old and young horses than three bushels of uncrushed!

Price £5 15*s*. 6*d*.

Made and Sold by
E. R. & F. TURNER, St. Peter's Iron Works, Ipswich.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
AT THE NORWICH, GLOUCESTER, LINCOLN, and CARLISLE SHOWS, the Prize for the best LINSEED and CORN CRUSHER was awarded to E. R. & F. Turner, St. Peter's Iron Works, Ipswich.

E. R. & F. Turner invite the attention of Agriculturists and others to the following machines of their manufacture:—
ROLLER MILLS for Crushing Linseed, Oats, Barley, Malt, &c., of various sizes, with or without Bean-mill combined. The numerous prizes awarded these Mills by the Royal and other agricultural societies, render comment on their merits unnecessary.
PATENT COMBINED GRINDING and CRUSHING MILL, for reducing Barley, &c., to a fine and soft meal, and crushing Oats, Linseed, &c., is strongly recommended for the variety of purposes to which it is applicable, and for its perfect and economic working. Price 25*l*.
CHAFF CUTTERS, for horse or steam power, cutting three lengths, with facility for changing the length of the cut almost momentarily, and other valuable improvements.
OILCAKE BREAKERS, made entirely of iron, with case, hardened teeth suitable for all descriptions of cake. Price 3*l*. 10*s*.
FIXED STEAM-ENGINES, on the horizontal direct acting principle. Long experience and attention to the practical working of steam-engines of every variety, have enabled the manufacturers to offer these Engines as inferior to none—either for efficiency, economy, or durability—and at prices which will be found comparatively low.
Superior Portable Steam-Engines and Threshing Machines, Horse-Power Threshing Machines, Circular Saw Tables, One Horse Carts, and various other Implements, are also manufactured at the above Works.
Illustrated Price Lists sent free on application.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS
MESSRS. BURGESS and KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. Price Lists sent free on application, and Illustrated Catalogue of the best Farm Implements, on receipt of eight postage stamps.

WARNER'S SWING WATER-BARROW
(TO HOLD THIRTY GALLONS)
Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump, is at a distance from the garden. May be obtained of any Ironmonger in town or country for 3*l*. 3*s*.
Manufactured by
John Warner & Sons, 8, Crescent, Jewin Street, London.

JOHN WARNER AND SONS,
Crescent, Jewin Street, London.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Streamer,
is strongly recommended for durability and low price, viz., 2*l*. 10*s*., to hold 10 gallons.
Larger sizes in wood or iron, viz., 14 gals., 18 gals., & 35 gals. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers
as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Prices sent on application. Syringes of various constructions and sizes from 9*s*. upwards. Metallic String from 5*d*. to 1*s*. 3*d*. per lb.

COTTAM and HALLEN have on Show, at their Repository, No. 2, Winsley Street, Oxford Street, London, a great variety of the following articles for the Garden, &c., at very low prices, viz.:—Garden Rollers, Cast-Iron Bucksaws, Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and a large assortment of Horticultural and Agricultural Implements.
Ornamental Wire Flower Stands, Pot Trainers, Rose Trees Guards, Flower Bordering, and every description of Wire Work both plain and ornamental.
Hand Glass Frames, Cast and Wrought Iron Flower Stands, Garden Arches, &c.
Strong Iron Hurdles, and best Wire for Strained Wire Fencing.
Hothouses, Conservatories, &c., made upon the most improved principle, either of Iron, or of Iron and Wood combined, which can be fixed complete, with Hot Water Apparatus, in any part of the Kingdom. Show Rooms at the Manufactory, 2, Winsley Street, Oxford Street, opposite the Pantheon, where every information may be obtained.

THE COMFORT of a FIXED WATER-CLOSET for £1.—Places in gardens converted into comfortable Water-closets by the PATENT HERMETICALLY SEALED PAN, with its self-acting valve, entirely preventing the ingress of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l*. Hermetically-sealed Inodorous Chamber Commodes, 1*l*. 2*s*., 2*l*. 4*s*., and 3*l*.; also Improved Portable Water-closets with pump, cistern, and self-acting valve. A Prospectus, with Engravings, forwarded by enclosing two postage stamps.
At Fyfe & Co.'s Sanatorium, 46, Leicester Square, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present reduced prices of Glass for Cash:—

SHEET SQUARES.—In Boxes of 100 feet.

6 by 4, and 6½ by 4½	£0 12s. 0d
7 „ 5, — 7½ „ 5½ }	0 14 0
8 „ 6, — 8½ „ 6½ }	
9 „ 7, — 9½ „ 7½, 10 by 6 }	0 16 0
10 „ 7, 10 by 8 }	

STOCK SIZES, in 100 feet boxes, from 12 by 10 to 20 by 15, at 18s. per 100 feet. If cut to order not exceeding 40 inches long.
16 oz. from 2½d. to 3½d. | 21 oz. from 3½d. to 4½d.
26 oz. from 5½d. to 7½d.

Sixteen-ounce Sheet Glass packed in cases of 200 feet, or Crates of 300 feet, 2½d. per foot.

SIXTEEN-OUNCE SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO Mr. RIVERS, and of various dimensions, always on hand.

Double-crown Glass of various dimensions in 100 feet boxes.

GLASS TILES for Workshops, Farm Buildings, &c.

½ of an inch thick	£1 17s. 6d.	per case of	50
⅝ „	2 1 3	„	60
¾ „	1 17 6	„	60

Glass Slates of the usual dimensions.

Glass Milk Pans, 21s. per dozen: Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Cameys' Milk Syphons, Wasp Traps: Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, Sheet Lead, Pipe, White Lead, Oils and Colours, Paint Brushes, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

FOREIGN AND ENGLISH SHEET GLASS WAREHOUSE, 87, BISHOPSGATE STREET, WITHOUT.

T. MILLINGTON supplies the above SHEET GLASS in any size or substance, packed in 100, 200, or 300 feet cases. Same as supplied to Mr. RIVERS and the leading men of the day. Reduced tariff, boxes included.—Per 100 ft.

HARTLEY'S Rough Plate, Sheet and Rough, Tiles, Striking and Bee Glasses, Milk Pans, Cucumber Tubes, and Wasp Traps, as Horticultural List.

Milled Sheet, White Lead, and Lead Pipe. Paints, Colours, and Varnishes, see Colour List, which can be had on application.

Established more than 100 years.

BY ROYAL LETTERS PATENT.

THE COSMOPOLITAN GLASS COMPANY, HELY & WARING, Managers, 296, Oxford Street, London. REDUCED TARIFF OF AGRICULTURAL AND HORTICULTURAL GLASS.

STRONG HORTICULTURAL SHEET, from 2d.; and HARTLEY'S PATENT ROUGH PLATE, from 4½d. per foot.

PERFORATED GLASS for Ventilating Dairies, Stables, &c., from 1s. 6d. per foot. German-shaped Milk-pans, 21s. per dozen: Hely's Test Churns, 5s. each: Waring's Butter Slabs, 10s.: Glass Fern Shades and Stands, from 3s; Bee-glasses, from 6d.: Cucumber Tubes, from 1s.; Propagating Glasses, from 3½d. to 7s. each; Flower Labels, 7s. per 100; Aquariums, complete, 10s. each; and every other description of Agricultural, Horticultural, Architectural, Domestic, Scientific, and Ornamental Glass, British and Foreign.—Catalogues free.

CHASE'S BEETLE POISON,

ENTIRELY FREE FROM DANGER TO HUMAN LIFE, AND PERFECTLY HARMLESS TO CATS AND DOGS.

A Safe and most Effectual Destroyer of Black Beetles and Cockroaches: one trial alone will suffice to prove its great efficacy, and one box will destroy thousands. The great advantage in this preparation is that it does not leave their bodies to decay and corrupt the air, but completely dries up and destroys them, so that nothing is left to cause an unpleasant odour when dead.

Directions for use: Place four or five of the Balls each night where the Beetles mostly resort.

Sold in boxes at 1s. each, by THOMAS CHASE, Chemist, 14, Holborn (opposite Furnival's Inn), London. And may be obtained through all wholesale medicine vendors.

To the Editor of the "Cottage Gardener," July 3d, 1855.

"Some of your readers may be glad to hear of an effectual poison for these disagreeable pests. I have succeeded in completely clearing my house of them by the use of Chase's Beetle Preparation (14, Holborn). I recommend those who are troubled with these insects to place the pills in every place in the house haunted by them, and to repeat the application twice after intervals of 10 days; by this means the successional crops of young beetles are destroyed."—*C. W. J., Croydon.*

(Ed.—This is not a mere puff, but sent to us by a gentleman who has been benefited as he states.)

ONE THOUSAND BEDSTEADS TO CHOOSE FROM.—HEAL AND SON have just erected extensive Premises, which enable them to keep upwards of 1000 Bedsteads in stock, 100 of which are fixed for inspection, comprising every variety of Brass, Wood, and Iron, with Chintz and Damask Furnitures complete. Their new Warerooms also contain an assortment of BED-ROOM FURNITURE which comprises every requisite, from the plainest japanned deal for servants' rooms, to the newest and most tasteful designs in mahogany and other woods. The whole warranted of the soundest and best manufacture. HEAL AND SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS AND PRICED LIST OF BEDDING sent free by post.—HEAL AND SON, 196, Tottenham Court Road.

A CLEAR COMPLEXION,

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for softening, beautifying, and preserving the skin, and giving it a blooming and charming appearance, being at once a fragrant Perfume and delightful Cosmetic. It completely removes tan, sun-burn, redness, &c., and by its balsamic and healing qualities renders the skin soft, and free from dryness, scurf, &c.; clears it from every humour, pimple, or eruption, and by continuing its use only a short time the skin becomes and continues soft and smooth, and the complexion clear and beautiful. In the process of shaving it is invaluable, as it annihilates every pimple and all roughness, and affords great comfort if applied to the face during cold easterly winds.—Sold in Bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

TOURISTS, TRAVELLERS, AND OTHERS,

EXPOSED TO THE SCORCHING RAYS OF THE SUN, AND HEATED PARTICLES OF DUST, WILL FIND

ROWLAND'S KALYDOR a most refreshing preparation for the Complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, Flushes, and Discoloration fly before its application, and give place to delicate clearness, with the glow of beauty and of bloom. In cases of sunburn or stings of insects, its virtues have long been acknowledged. Price 4s. 6d. and 8s. 6d. per bottle.

ROWLAND'S MACASSAR OIL, a delightfully fragrant and transparent preparation, and as an invigorator and purifier beyond all precedent.

ROWLAND'S ODONTO, OR PEARL DENTIFRICE, a White Powder, compounded of the rarest and most fragrant exotics. It bestows on the teeth a pearl-like whiteness, frees them from Tartar, and imparts to the Gums a healthy firmness, and to the breath a grateful sweetness and purity.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—The most marvellous production of modern date is ROSALIE COUPELLE'S CRINUTRIAR, which is guaranteed to produce Whiskers, Moustachios, Eyebrows, &c., in a few weeks, and restore the Hair in baldness from whatever cause, strengthen it when weak, prevent its falling off, and effectually checks greyness in all its stages. For the nursery it is recommended by upwards of 100 physicians, for promoting a fine healthy head of hair, and averting baldness in after years. Sold by all Chemists and Perfumers, price 2s., or will be sent post free on receipt of 24 penny stamps, by Miss COUPELLE, 69, Castle Street, Newman Street, Oxford Street, London. Mrs. CARTER writes, "My head, which was bald, is now covered with new hair." Mrs. WILLIAMS—"I can show a fine head of hair from using your Crinutriar." Mrs. REEVE—"My hair is gaining strength and thickness." Sergeant CRAVEN—"Through using it I have an excellent Moustache." Mr. YATES—"The young man has now a good pair of whiskers. I want two packets for other customers."

METCALFE AND CO.'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2s. per box.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to communicate to others the means of cure; he will therefore send free, on receiving a stamped envelope, properly addressed, a copy of the prescription used.—Direct Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

HOLLOWAY'S OINTMENT AND PILLS EFFECTUAL IN THE CURE OF SCROFULA.—Copy of letter from Mr. Campbell, of Hastings:—"To Professor HOLLOWAY. Sir, I am happy to bear witness to the wonderful efficacy of your Medicines in cases of Scrofula. A friend of mine was severely afflicted with this complaint for several years, indeed so bad that several experienced surgeons said he was incurable. After all hopes of recovery a friend persuaded him to try your Medicines, and the consequence was that he has now entirely got rid of his complaint."—Sold by all Medicine Vendors throughout the World; at Professor HOLLOWAY'S Establishments, 244, Strand, London, and 80, Maiden Lane, New York; by A. STAMPA, Constantinople; A. GUIDICY, Smyrna; and H. HOOD'S, Malta.

MEDICAMEN VIRTUTIBUS FLORENS.

DISCOVERY EXTRAORDINARY! Dr. ARNOT'S PILLS.—The speedy cures effected by this new discovery in Medicine, where all other remedies have failed, are most extraordinary, as testified to by the numerous testimonials daily received by the proprietor from all classes of society, who have been restored to health by these Pills. They create by their peculiar action on the LIVER and the DIGESTIVE ORGANS a new and sanatory state of the blood and other vital fluids, by which means the morbid conditions of the body are immediately removed. They, moreover, strengthen the constitution, and speedily restore the patient to health.—In boxes, at 1s. 1½d. Depôt, 50, Rathbone Place, London. Order through any Chemist. By post for 14 Stamps.

WESTON-SUPER-MARE, SOMERSET.

To NURSERYMEN AND SEEDSMEN.

TO BE LET, for a term if required, with immediate possession, a capital NURSERY, standing upon Three Acres of Land, with a well arranged Dwelling House, containing one Sitting Room, four Bed Rooms, Kitchen, and all other necessary and convenient Offices recently erected thereon, together with Green and Forcing Houses, of large dimensions, adjoining thereto. This property is situate within three minutes' walk of the Weston Station of the Bristol and Exeter Railway, in the well known flourishing and rapidly improving watering place of Weston-super-Mare, is well sheltered from the east, west, and north winds, and presents such an opportunity to a party desirous of embarking in the business of Nurseryman as seldom occurs. The tenant will be required to take the stock now being upon the premises at a valuation.—To view and for all further particulars, apply to LOVIBOND & GLYDE, Solicitors, Weston-super-Mare.

ESSEX.

TO BE SOLD, upon advantageous terms to any party, approved by the proprietor, an unexpired LEASE of Four Years of a valuable FARM in the above county, within 15 miles of London, and three miles of a railway station. It is in a high state of cultivation, containing about 350 acres of Arable and 30 acres of Upland Pasture.—For particulars apply to Mr. BARNES, Belstead Hall, near Ipswich, Suffolk.

GLAMORGANSHIRE.—THE GNOLL ESTATE.

TO BE SOLD, by Private Treaty, the CASTLE, with either 600 or 6000 Acres of Land, or, separately, about Forty Farms, varying in size from 20 to 300 Acres, nearly all let to yearly tenants.—Applications to treat for any portions of the above must be made to W. BRIGNOR WHITTON, Esq., the Gnoll, Neath. Rentals and full particulars may be obtained either from him, or of Messrs. OSBORNE, WARD, & Co., Solicitors, Bristol. N.B. A great portion of the Neath House Property and Off-lying Farms have been sold.

VINERIES.

TO BE SOLD, by Private Contract, in one or two Lots, an extensive range of three newly-erected FORCING HOUSES, with Iron Framing, Wood Sashes, and all Copper Bars, the whole measuring upwards of 78 feet long (i.e., the centre House, 26 feet by 15 feet 6 inches, and the wings about 26 feet by 13 feet each). The Houses are in the most perfect order, and having been built by Messrs. Jones & Clarke, and finished in a very superior manner throughout, are well deserving the attention of gentlemen requiring Hothouses. In the centre House is a very superior and expensive Iron Tier Flower Stage, and a crop of Grapes, which may remain until ripe if desired.—For further particulars, apply to Messrs. COOKES, SONS, & MERES, Agents, Leamington.

SHORT-HORN COWS AND HEIFERS FROM HORNCASTLE AND MELTON FAIRS.

MESSRS. JOHNSONS', of the Manor Farm, Highgate, beg to inform Gentlemen and the Trade that they will Show on TUESDAY next, the 28th inst., from 200 to 300 first-rate Cows and Heifers from the above Fair. Out of this lot will be found several animals of pure blood for breeding or exportation.

Sales by Auction.

ORCHIDS.

MR. J. C. STEVENS is favoured with instructions to announce for Sale by Auction at his Great Room, 38, King Street, Covent Garden, early in SEPTEMBER, a most important and valuable collection of ORCHIDS, the property of a private gentleman, and consisting of fine specimens of all the best varieties of Vandas, Ærides, Cattleyas, &c. Further particulars will be shortly announced.—38, King Street, Covent Garden.

MR. D. A. RAMSAY begs respectfully to announce to his numerous friends and the public that he has RESUMED the BUSINESS of an AUCTIONEER, Valuer, Estate and Land Agent, and, from his long practical experience of the value of property, feels great confidence in soliciting the support of his former patrons and friends, and in doing so begs to call their attention to the central position of his offices; and to assure them that all business entrusted to his charge shall be conducted with the greatest promptitude and despatch, and to their entire satisfaction. Mr. D. A. R. respectfully invites the attention of all parties having property to let or sell, to furnish him with full particulars, when the same will be duly registered, free of charge.—Auction and Estate Agency Offices, 79, King William Street, City. Aug. 25.

HARROW ROAD.

LEASEHOLD CARCASES, IN PRIVATE RESIDENCES AND SHOPS.

MR. D. A. RAMSAY is instructed to Sell by Auction, at the Mart, on FRIDAY, September 21, at 12, in six lots, 16 well-built CARCASES of 12 roomed RESIDENCES (four having shops), situate in Delamere Crescent, Westbourne Grove north, within three minutes' walk of the Paddington Station on the Great Western Railway, and overlooking the Grand Junction Canal. Held on lease for a long term unexpired, at low ground rents. May be viewed, and particulars obtained in due time of Messrs. ROOKS, LANE, & RHODES, solicitors, 62, Chancery Lane; at the Mart; and of Mr. D. A. RAMSAY, auctioneer and estate agent, 79, King William Street, City.

NOTTING HILL.

LONG LEASEHOLD PROPERTY, OF THE VALUE OF 200l. PER ANNUM, FOR OCCUPATION OR INVESTMENT.

MR. D. A. RAMSAY is instructed to Sell by Auction, at the Mart, on FRIDAY, September 21, at 12, in four lots, a LEASEHOLD ESTATE, comprising four substantially erected Family Residences, containing 12 rooms each, being Nos. 21, 25, 27, and 29, Portland Road, of the estimated value of 200l. per annum. Held on lease for long terms unexpired, at low ground rents. May be viewed, and particulars obtained of Messrs. Western, Solicitors, 7, Great James Street, Bedford Row; at the Mart; and of Mr. D. A. RAMSAY, Auctioneer and Estate Agent, 79, King William Street, City.

SOUTH DEVON.

STOCK FARM, 218 ACRES, WITH WATER POWER.

MESSRS. DAVIS AND VIGERS are directed to Sell by Auction, at the Mart, London, on THURSDAY, September 27th, at 12 for 1 o'clock, the FREEHOLD FARM, called "Hutcherley," situate in the parishes of Blackawton and Halwell, south of the high road, five miles from Kingsbridge and six miles from Totness. It includes 20 acres of rich water Meadow, 66 of fine Pasture, 9 of Orchard, 14 of Woodland, and 111 of Arable, with Residence and Farm Buildings. The climate is singularly mild, salubrious, and favourable to stock, and the soil is adapted to Grass and Root cultivation, as well as Corn. The Pasture may be grazed either to fatten or for dairy purposes.—May be viewed on application to Mr. JOHN GRANT, on the premises, of whom particulars with plans may be had; also of JOHN ANDREWS, Esq., Solicitor, Modbury; at the Stars Inn, Totness, the King's Arms Inn, Kingsbridge; the Castle Inn, Dartmouth; at the Mart, and Auctioneers' Offices, 3, Frederick's Place, Old Jewry, London.

COLESHILL, BERKS.

IMPORTANT SALE OF HEREFORD CATTLE & SOUTH-DOWN SHEEP.

MESSRS. FIDEL AND DYKE have been directed by Mr. Moore to offer to public competition, on FRIDAY, the 14th of September, at 12 for 1 o'clock, on the premises at Coleshill, the valuable Herd of 70 HEREFORD BULLS, COWS, HEIFERS, and CALVES, and also 176 pure SOUTH-DOWN BREEDING EWES and TEAVES belonging to the Right Honourable the Earl of Radnor. This Herd has been bred with the greatest care from some of the best herds in the counties of Hereford and Salop, and with an infusion of the best blood from the herds of the late Earl Talbot and Sir F. Lawley. It includes animals which have taken prizes at Smithfield and Lincoln; also the Bull which took the second prize at Carlisle, in a class which had ten competitors, and was allowed by the Judges to be the best lot ever exhibited. The Sheep are also of a superior character, and are bred from the flocks of Messrs. Jonas Webb, Northeast, and Sainsbury.—Catalogues with pedigrees will be published immediately, and may be had of the Auctioneers, Faringdon, Berks: or at the place of sale.

Coleshill is four miles from the Shrivenham and eight from the Swindon stations on the Great Western Railway.

On the 31st inst. will be published, price 6s., PART VI. of the

FERNS OF GREAT BRITAIN

NATURE-PRINTED (LIFE SIZE).

RAMADGE, M.D., Fellow of the College of Physicians, late Senior Physician to the Royal Infirmary for Diseases of the Chest, &c. Also, by the same Author, price 10s. 6d.,
A TREATISE ON ASTHMA AND DISEASES OF THE HEART.
London: LONGMAN, BROWN, GREEN, & LONGMANS.

NEW AND ENLARGED EDITION OF DR. LINDLEY'S THEORY OF HORTICULTURE.

Just Published, in 8vo, with 98 Woodcuts, price 21s. cloth,

THE THEORY AND PRACTICE OF HORTICULTURE; or, an Attempt to explain the chief Operations of Gardening upon Physiological Grounds: being the Second Edition of the "Theory of Horticulture," much enlarged. By JOHN LINDLEY, Ph.D., F.R.S., Corresponding Member of the Institute, Vice-Secretary of the Horticultural Society, Professor of Botany in University College, London, &c.

"The First Edition of this valuable work was issued in 1840, since which time it has had an extensive circulation, and has been translated into the German, Dutch, and even Russian languages. Being more particularly restricted to principles, however, the author at length resolved to render the work more generally interesting and useful by a more frequent reference to practical operations. He has thus greatly extended the matter, by supporting the physiological doctrines with an appeal to facts familiar to cultivators, or which ought to be; and the result is a still more interesting and popular compendium of the principles and practice, or the science and art, of horticulture."—*Builder.*

"This is a Second Edition of the "Theory of Horticulture," with the addition of a large quantity of practical matter, introduced to show how entirely scientific principles and good cultivation correspond. The volume contains about four times as much matter as the first edition . . . . Although very large additions are made to every chapter, while many passages in the first edition have been wholly struck out, it may be proper to say that the greatest changes are those which relate to vitality, climate, domestication, ventilation, propagation, pruning, resting, and soils and manures; such being the subjects in which practical men are most interested. The whole work has, indeed, assumed such a form as to make it evident that the great object of the author has been, not to produce a work suited to men of science, but one which every well informed gardener may understand and apply. As the volume concludes with a very copious index of matter, there is no difficulty in ascertaining where any given subject is treated of."—*Gardeners' Chronicle.*

By the same Author,

INTRODUCTION TO BOTANY. 4th Edition, greatly enlarged; with 6 Plates, and numerous Wood Engravings. Two vols. 8vo, 24s.

*** It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Now ready,

THE FERNS OF GREAT BRITAIN: Illustrated by JOHN E. SOWERBY. The Descriptions, Synonyms, &c., by Charles Johnson, Esq. In One Vol. cloth boards, containing 49 Plates, full coloured, 27s.; partly coloured, 14s.

THE TARIFFS OF ALL NATIONS.

Now ready, One Volume Quarto, 30s.,

A COLLECTION OF THE CUSTOMS' TARIFFS OF ALL NATIONS: Based upon a Translation of the Work by M. HUBNER. Augmented by additional information, brought up to the year 1855. By C. N. NEWDEGATE, M.P.

"Mr. Newdegate, after vainly attempting to induce Government to extend and improve the publication of commercial statistics, has himself collected and published the tariffs of various nations, in redemption of a voluntary pledge he gave in the House of Commons."—*Spectator.*

"Among recent commercial publications has been a valuable and elaborate one by Mr. Newdegate, the Member for North Warwickshire, consisting of a Collection of the Customs Tariffs of all Nations, brought down to the end of last year, and arranged upon the principle of the work supplied to the Prussian Government in 1852, by M. Otto Hubner."—*Times' City Article.*

JOHN MURRAY, Albemarle Street.

THE PRACTICAL GARDENER, AND MODERN HORTICULTURIST; in One Volume, 988 pages closely printed, with upwards of 300 illustrative Woodcuts, containing the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens; the Greenhouse, Hothouse, Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. Bound in cloth, price 21s.; and also with Specimens of choice Flowers, coloured, 26s.

"The labour and experience of a life devoted to the science of horticulture we now present to the public."—*Vide Author's Preface.*

With an Appendix, describing a new and economical method of producing uniform bottom heat from hot-water tanks upon the most simple plan, with explanatory diagrams, and reference to buildings now in successful operations.

London: T. KELLY; SIMPKIN, MARSHALL, & Co.

CHARLES EDWARD MUDIE, 510, New Oxford Street, London, and 76, Cross Street, Manchester.

TO BE SOLD, a complete set of the GARDENERS' CHRONICLE, from 1841 to 1853, bound; and for 1854 to July 1855, unbound. The whole in good condition.—For price, &c., apply to the Office of this Paper.

TO ADVERTISERS.

THE SOUTH-EASTERN GAZETTE, a Family, Commercial, and Agricultural Newspaper, which has a circulation exceeding 3300 copies weekly, has been at the head of the Kentish Press for 20 years, for the past five years has had double the circulation, and, as shown by the official stamp returns to July 1, 1855, has now three times the circulation of the next highest, and nearly five times that of any other Newspaper in Kent. It has a larger circulation than the whole of the papers published in East Kent together, and also than the whole of those published in West Kent.—Published every Tuesday, price 5d., stamped, 4d. unstamped, at the Offices, 27, Week Street, Maidstone, and 21, High Street, Canterbury.—Maidstone, August 25.

JOHNSON AND SHAW'S FARMERS' ALMANAC AND CALENDAR FOR 1856.—This work (which has been almost entirely rewritten) being now in active preparation, corrections and suggestions for its improvement are earnestly requested, addressed to the Publisher.

It will be published as usual on the 1st of November; no advertisement for its advertising sheet will be received after the 10th of October.

London: JAMES RIDGWAY, 169, Piccadilly.

CAUTION.

PARKES' STEEL DIGGING FORKS AND DRAINING TOOLS.

Whereas very inferior descriptions of Steel Digging Forks are now manufactured and sold, and I have been informed that purchasers of the same have believed them to be the same as those manufactured by me, and to which the Royal Agricultural Society and numerous Agricultural Societies' prizes have been awarded, I hereby respectfully inform the public that every Fork manufactured by me is stamped with my trade mark "J. P.," and that Messrs. BURGESS & KEY, of No. 103, Newgate Street, London, are my sole Wholesale Agents, and I have authorised them to replace to the purchaser every Fork of my manufacture found defective; they will also on application send Wholesale and Retail Price Lists, &c., post free. FRANCIS PARKES & Co.

THE HARVEST.

DRUMMOND'S IMPROVED REAPING SCYTHES continue to give every satisfaction, and the demand is yearly on the increase. They are as usual got up with every possible care, and are fitted with the very best picked blades. Price for three Scythes complete, 30s.; do. for six, 56s. Carriage paid to the principal Railway Stations throughout the kingdom. W. DRUMMOND & SONS, Seed and Implement Warehouse, Stirling, N.B.

*** To prevent disappointment early orders are respectfully requested.

N.B. Unknown correspondents will please accompany their orders with a remittance.

WOOD STACK PEGS ENTIRELY SUPERSEDED BY

FULLARD'S PATENT IRON SCREW THATCH PINS.—Great advantage is secured against having Corn and Hay Stacks unroofed, as is often the case in strong gales, by using the Patent Iron Screw Thatch Pins. They will wear many years, are easily and firmly inserted in all kinds of stacks, and a much less number than of the common wood pegs will suffice. They will be found extremely serviceable to the corners and sides of stacks that are much exposed to wind.

Orders speedily attended to; and may be had at 3s. 6d. per dozen, of the Inventor and Patentee, Mr. GEORGE FULLARD, Thorney, near Peterborough.

RANSOME'S SILICEOUS STONE.

THE PATENT SILICEOUS STONE COMPANY are prepared to execute Contracts for the supply of all kinds of Ornamental Details for Buildings, &c., manufactured in this beautiful material, which has received the approval of eminent architects and scientific men, and which for sharpness of outline, durability, and cheapness, stands unrivalled. It is especially applicable for the elaborate details of Mediæval and Ecclesiastical Architecture, for Gothic Windows, Doorways, Pinnacles, &c.; Crosses, Corbels, Altar Screens, Pulpits, Fonts, Monumental Tombs, Tablets, Headstones, &c.; also for all kinds of Garden Decorations, Fountains, Figures, Vases, and Pedestals; Flower Boxes, Wardean Cases, Balustrades for Terrace Walks, Gate Piers, Caps, Bases, &c. &c.; and for Coats of Royal Arms, Chimney Pieces, Brackets and Trusses, Ashlars, Quoins, String Courses, and other Dressings.—Further particulars, with illustrations, on application to Mr. EDWD. MENDHAM, Secretary, at the Company's Offices, Whitehall Wharf, Cannon Row, Westminster; or to Mr. FREDK. RANSOME, Patent Stone Works, Ipswich.

M'DOUGALL'S PATENT DISINFECTING POWDER, for Preventing Foul Smells and Noxious Emanations, is the most efficient and cheapest disinfectant yet produced, and is most valuable in improving the quality of all Manures.

Its effects in stables, cowhouses, piggeries, and other outhouses, are remarkable in drying the pavement, destroying all offensive emanations, and completely purifying the atmosphere.

It arrests fermentation, so that offensive smell cannot recur.

It clarifies foul water and sewage, by the precipitation of the soluble impurities, and the solid matter thus deposited becomes valuable Manure.

MANURES treated with this disinfector will be found much improved, as the ammonia and phosphoric acid are preserved, and a compound formed well known to be of great value for agricultural purposes.

The Powder may be sprinkled dry over the source of impurity, or it may be mixed previously with water, in the proportion of half an ounce to a quart of water.

The Secretary of War has ordered that this powder shall be used on board all the transports conveying troops to the seat of war.

Sold in packets and bags by Messrs. GIBBS & Co., Down Street Piccadilly; Messrs. BARCLAY & SONS, Farringdon Street; and Messrs. WILKINSON & BRIDGE, 270, Regent Street, London.

A HANDSOME PORTABLE BAROMETER FOR 21s.

HENRY BAKER calls the attention of the public to his Improved MODEL BAROMETER, made of solid Rosewood and mounted with Ivory Plates, with a Thermometer. The above Instrument for Accuracy and Style stands unrivalled; it is Portable, and WARRANTED to perform well; and being manufactured on the premises, it is highly recommended. Can be sent into the country without risk of breakage for 1s. extra.

HENRY BAKER, Instrument Maker to the Board of Admiralty, 90, Hatton Garden, London.

S. W. SILVER AND CO., OUTFITTERS, CLOTHIERS, WATERPROOFERS, and CONTRACTORS, beg to acquaint their Customers and the public that outfits may be procured, and SHIPPING and COLONIAL INFORMATION obtained (having Agents in almost all parts of the Globe) as under:—

The FIRST-CLASS CABIN PASSENGERS' Outfitting Branch (with Naval and Military Uniforms)	at Nos. 66 and 67, Cornhill.

A MEETING OF THE BRITISH POMOLOGICAL SOCIETY will be held at the Rooms, 20, Bedford Street, Covent Garden, on MONDAY, September 17th, at 1 o'clock, for examining and reporting upon collections of Fruit; and it is hoped that all who take an interest in the cultivation of Fruits and Fruit trees will aid the Society by sending such specimens of Fruits as they can command. Persons desirous of being elected members are requested to make application to the Secretary, to whom also all packages are to be addressed,

ROBERT HOGG, Secretary.

HEREFORD HORTICULTURAL SOCIETY.—The THIRD EXHIBITION for the present year will be held on the Castle Green, Hereford, on TUESDAY next, Sept. 4, when Special Prizes will be given for Plants, Stove and Ornamental Flowers, Fruits, and Vegetables.—WM. PHILLIPS, 23, High Town, Hon. Sec.—Sept. 1.

TO DAHLIA GROWERS.

NORFOLK AND NORWICH HORTICULTURAL SOCIETY.—The DAHLIA SHOW will be held at the Corn Exchange, Norwich, on WEDNESDAY next. Amongst others, Prizes of 5*l*., 3*l*., and 2*l*. will be offered for 24 dissimilar DAHLIA BLOOMS (Fancies excluded), open to all Nurserymen and such Amateurs as are Subscribers. No entrance fee.

Norwich, Sept. 1. ARTHUR PRESTON, Hon. Sec.

ROYAL PAVILION, BRIGHTON.

THE BRIGHTON AND SUSSEX FLORICULTURAL AND HORTICULTURAL SOCIETY will hold their Autumn Exhibition of PLANTS, FRUITS, CUT FLOWERS, &c., on WEDNESDAY and THURSDAY, the 12th and 13th instant, at the above splendid suite of Rooms and Grounds, on the same grand scale as former years. Prizes are offered with the same liberality as previously. Also the Railway Cup, value 10 guineas, for the best 24 Show Dahlias for Amateurs. By the liberality of the Railway company, all plants, &c., will be conveyed to Brighton and back, carriage-free, from all stations on the lines. Schedules can be had on application to E. SPARY, Superintendent of the Exhibition; or the Secretary, E. Carpenter, 45, Lavender Street, Brighton. By order of the Committee, E. CARPENTER, Secretary.

NEWBURY HORTICULTURAL SOCIETY.—HOLLYHOCKS AND DAHLIAS (Open Class).—At the Autumn Show of the Society, on FRIDAY next, the 7th instant, an Amateur Member of the Society will give a SILVER CUP of the value of Five Guineas for the best collection of 12 dissimilar HOLLYHOCKS, on Spikes, and the Society will give Three Guineas for the second best, and Two Guineas for the third best. Also the Society will give Three Guineas for the best collection of 24 dissimilar blooms DAHLIAS, and Two Guineas for the second best. Entrance Fee to either class, 5*s*. Flowers to be ready for the inspection of the Judges at 11 o'clock precisely. The Grounds join the Station.—For further particulars address to the Hon. Secretaries, 9, Northbrook Street, Newbury.

WILLIAM BARRATT, LANDSCAPE GARDENER, Wakefield.

*** Plans and Estimates furnished.

LANDSCAPE GARDENING, GARDEN ARCHITECTURE, AND GENERAL IMPROVEMENT OF DOMAINS, WOODS, PLANTATIONS, &c.

CHARLES M'INTOSH, F.R.P.S., A.L.S., &c., Author of the "Book of the Garden" and other works on Horticulture, &c. Late Curator of the Gardens of his Majesty the King of the Belgians at Claremont and Brussels, and latterly of those of his Grace the Duke of Buccleuch at Dalkeith Palace.

Newcome Villa, Murrayfield, Edinburgh.

NURSERY STOCK.

H. BIGLAND AND CO. beg to state that the LEASE of their NURSERY having now expired, they have concluded to offer the remainder of their STOCK (consisting of Evergreens, Fruit, and Forest Trees, Greenhouses, &c.) by Auction this autumn; the precise time will be named in a future Advertisement.

Clapton Nursery, London.—Sept. 1.

CALCEOLARIA SEED.

J. SMITH, the raiser of "Sultan," has with great care and perseverance raised the finest Shrubby Calceolaria in England, and by impregnation has saved a small quantity of Seed, which he offers at 5*s*. per packet. If not turning out first-rate the money will be returned.—Apply to JAMES SMITH, Hendon Place, Hendon, Middlesex, by post-office order on Hendon.

CALCEOLARIA.

JOHN CATTELL is still sending out seed of very superior Calceolaria, saved from the finest varieties of Major's and other growers, carefully hybridized, 2*s*. 6*d*. per packet. Ditto, saved from an entirely new class to any hitherto sent out by J. C., having very large flowers, with distinct and splendid colours, extra free bloomers, 5*s*. per packet.

The other seeds advertised in the *Gardeners' Chronicle*, Aug. 4th, and following numbers, may still be had.

Nurseries, Westerham, Kent.

CALCEOLARIA AND CINERARIA.

MESSRS. E. G. HENDERSON AND SON beg to announce that the above FLOWER SEEDS, saved from the choicest varieties, may be had in packets at 2*s*. 6*d*. and 5*s*. each; the finest quality of CALCEOLARIA is only offered at 5*s*.; second quality, 2*s*. 6*d*.

This Season's CATALOGUE will be forwarded on application, and a Beautiful Coloured Plate of nine new Flowers will be sent on receipt of 12 postage stamps.

Wellington Nursery, St. John's Wood, Sept. 1.

CHOICE CINERARIA AND CALCEOLARIA SEEDS.

LUCOMBE, PINCE, AND CO. have now ready for sending out Seeds of their very superior

CINERARIAS AND CALCEOLARIAS,

which have been saved with great care from the finest varieties. The great satisfaction which their Cinerarias and Calceolarias have given for several successive years enables them to recommend their Seed of the present season with much confidence.

Packets of each, sealed and warranted by them, at 2*s*. 6*d*., free by post.—Exeter Nursery, Exeter, Established 1720.

SPLENDID HERBACEOUS CALCEOLARIA AND SWEET WILLIAM SEEDS.

WILLIAM BARNES has now ready for sending out a small quantity of the above Seeds, the former of which is unrivalled, and has given the greatest satisfaction to all purchasers for the last four seasons, 2*s*. 6*d*. and 5*s*. per packet.

SWEET WILLIAMS, grown from the same stock as the seed now offered, may be seen at the present time in full bloom at his Nursery, where they are pronounced by all who have seen them to be unequalled. 1*s*. 6*d*. per packet. Payment can be made by postage stamps.

Camden Nursery, Camberwell, London.

HYACINTHS AND OTHER BULBS JUST IMPORTED BY SUTTON AND SONS, SEED GROWERS, Reading, Berks.—This is a superior assortment of Bulbs, and will be sent out carriage free (except small parcels), at very moderate prices. A List may be had post free.

DUTCH HYACINTHS AND OTHER BULBS.

J. AND J. FRASER beg to announce that they have received their annual importation of HYACINTHS and other FLOWER ROOTS, of which a descriptive Catalogue may be had by enclosing one postage stamp. This Catalogue contains some instructions for the successful cultivation of the various roots.—Lea Bridge Road, Sept. 1.

DUTCH BULBS.

JAMES VEITCH, JUNIOR, Exotic Nursery, Chelsea, begs to announce that he has received his annual supply of BULBOUS ROOTS from Holland, and is pleased to say that they are particularly fine and in excellent condition. Catalogues are now ready, and will be forwarded on application.

N.B. J. V. Jun., desires to impress on those who patronise him the great advantage of giving him their orders early, as the successful cultivation of Bulbs depends in great measure on their being planted early in the season.—Sept. 1.

DUTCH FLOWER ROOTS.

HUGH LOW AND CO. are now receiving their annual importation of the above, and would solicit the early orders of their Friends. Catalogues may be had on application.—Clapton Nursery, London, Sept. 1.

DUTCH FLOWER ROOTS, ETC. ETC.

PETER LAWSON AND SON, SEEDSMEN AND NURSERYMEN TO HER MAJESTY THE QUEEN, and to the Highland and Agricultural Society of Scotland, beg to intimate the arrival of their first assortment of DUTCH FLOWER ROOTS, Catalogues of which may be had, free, on application, and orders for which are respectfully solicited,

They have also on hand very select stocks of foreign Italian Rye-grass, Crimson Clover (Trifolium incarnatum), Alsike Clover (Trifolium hybridum), Dwarf Essex Rape, Winter Tares, Stubble Turnip, &c. &c.

London: 27, Great George Street, Westminster.—Sept. 1.

IMPORTED DUTCH FLOWER ROOTS.

T. F. WINSTANLEY begs to announce that his Priced Catalogue of Dutch Bulbs for the present season will shortly be ready, and can be had free on application. It contains a list of all the newest and leading sorts in cultivation, including Hyacinths, Narcissus, Jonquils, Amaryllis, Early Single and Double Tulips, Crocus, &c., all of which have been grown by one of the first growers in Holland, and can be relied upon as being good sound Bulbs, and true to name.

28, Market Place, Manchester.

DUTCH FLOWERING BULBS.

JAMES CARTER AND CO.'s comprehensive CATALOGUE of DUTCH and CAPE BULBS and SEEDS for Autumn sowing, is now published, and will be forwarded free of charge and post paid upon application to JAMES CARTER & CO. 238, High Holborn, London.

WILLIAM CUTBUSH AND SON beg to acquaint their patrons and friends that their ANNUAL CATALOGUE of DUTCH BULBS can be had, postage free, on application. The superior quality of their roots is well known, but as a further guarantee they obtained the Awards at the Horticultural Society's Rooms, Regent Street, last spring.

Highgate Nurseries, near London.

SCARLET CARNATION.

J. WADSON begs leave to call attention to his advertisement of the above, with other Carnations, &c., in the *Gardeners' Chronicle* of last week.

Albion Road, Hammersmith.

HOLLYHOCKS.—The collection of Hollyhocks at the Cheshunt Nurseries is now in full bloom, and may be seen daily. Packets of choice Seed, 1*s*., 2*s*. 6*d*., and 5*s*. each.—A. PAUL & SON, Nurseries, Cheshunt, Herts.

TO THE SEED TRADE.

GEORGE TABER, of Ravenhill, Essex, begs to inform the Trade that his growing crops of Seeds are now open to inspection. All Turnip Seeds grown from sound transplanted roots. Lists sent on application.—Sept. 1.

CABBAGE PLANTS.

THOMAS WELLAND begs to offer TRUE CATTLE DRUMHEADS at 3*s*. per thousand; 8000 for 1*l*., packed and delivered at Godalming Station.—Surrey Gardens, Godalming, Surrey.

R. SMITH still continues to send out strong runners of his SEEDLING STRAWBERRY, SIR CHARLES NAPIER, which this season has proved itself good; both for forcing and natural it has no equal. Price 2*l*. per 100.

R. SMITH, Market Gardener, Twickenham.

BARRATT'S MAGNUM BONUM has this year fully sustained its high character as one of the finest flavoured STRAWBERRIES known, and may now be had at 2*l*. per 100, or 3*s*. per doz.—Catalogues containing all the leading varieties of the day may be obtained from WILLIAM BARRATT, St. John's Nurseries, Wakefield.

NEW STRAWBERRY.

KITLEY'S CAROLINA SUPERBA, not surpassed in flavour, habit, and productiveness by any Strawberry extant, at the low price of 2*l*. per 100, 9*s*. per doz., free by post, to be had of Messrs. GARRAWAY, MAYES, & Co., Bristol, agents for the west of England and South Wales, or of any respectable nurseryman. For a full description, testimonials, &c., see this Paper, April 14, 1855.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.

PRICED CATALOGUE OF PLANTS.

THOMAS JACKSON AND SON'S Priced Catalogue of Plants may be obtained on application. It contains Stove, Orchidaceous, Ferns and Mosses, Greenhouse, Ornamental Shrubs and Trees, Roses, and Herbaceous Plants.

T. J. & SON are offering at very low prices a large Stock of Azaleas, Camellias, Ericas, Epacrises, Helichrysums, Rhododendrons, &c., well deserving the attention of purchasers.

Nurseries, Kingston, Surrey.

THE PAMPAS GRASS,
"Gynerium Argenteum."

LUCOMBE, PINCE, and Co. have now for sale a healthy stock of well established Plants of the above, which will bloom finely this autumn, varying from one to two and three flower stems. Few Plants are more ornamental than this gigantic Grass, the leaves (which are more than 7 feet in length curving gracefully outwards) grow in large tussocks, thereby producing a very fine effect, and from the midst of these numerous flower stems arise to the height of from to 6 to 8 feet surmounted by elegant panicles of inflorescence nearly 3 feet long, resembling beautiful waving plumes of silvery feathers. It is perfectly hardy, and is also easy of cultivation. A grand specimen of this noble plant is now in the Exeter Nursery, pushing up nearly twenty large flower stems and numerous small ones, and will continue to be an object of great attraction for a considerable time. Prices and full particulars may be had on application to

LUCOMBE, PINCE, & Co., Exeter Nursery, Exeter.
Established 1720.

SPLENDID NEW BEGONIA,
SEMPERFLORENS SAUNDERSI.

GARAWAY, MAYES, and CO. are now prepared to execute orders for this fine Seedling Begonia (raised by Mr. F. Saunders, Gardener to W. Miles, Esq., M.P., Leigh Court), which is, without exception, the most useful and beautiful variety in cultivation. The original plant first bloomed in May, 1854, when only 6 inches high, and has continued without ceasing to produce from the axils of every leaf its splendid panicles of transparent vermilion buds, which develope to fine clear brilliant rose flowers, emitting a most agreeable odour. Its habit is close and compact, seldom attaining more than 3 feet; foliage small and extremely bright, forming altogether an object of beauty unrivalled by any other variety in its class. Price 10*s.* 6*d.* each, with an allowance to the trade of one upon every three ordered; also a few extra sized plants at 15*s.* and 21*s.*

Durdham Down Nurseries, Bristol.

WILLIAM YOUNG begs to call the attention of Noblemen, Gentlemen, Public Companies, and Planters in general to his extensive stock of CHOICE CONIFERÆ, HARDY EVERGREENS, ORNAMENTAL TREES, AMERICAN PLANTS, &c., which are this season particularly fine, and having been well prepared for removal, he can confidently recommend them to transplant with perfect safety.

W. Y. invites persons about to plant to inspect his stock, which is standing over 50 acres of ground, in which will be found all kinds of plants adapted to every description of ornamental planting. It consists of HARDY CONIFERÆ, containing some of the finest specimen plants ever offered.

Do. all the new and best vars.
Kalmias, Andromeda, Ledums, &c. &c.

STANDARD ROSES, of all the best varieties.
FRUIT TREES, ORNAMENTAL DECIDUOUS TREES, for Parks or Avenues, from 10 to 12 feet.
FOREST TREES, for Copse Planting, from 2 to 4 feet.
Prices given on application.

A Catalogue is in course of publication, and may be had the first week in September for two postage stamps.

The Nurseries are two miles from Godalming Station, South-Western Railway, where conveyances can always be obtained.

Milford Nurseries, near Godalming, Surrey.

MESSRS. WILLIAM ROLLISSON and SONS are desirous of directing the attention of the Nobility and Gentry, who are about to plant or make alterations in their Ornamental and Pleasure Grounds, to their immense Stock of AMERICAN PLANTS, in all sizes, which extends over an area of several acres. In large plants there are several thousands, and of such as Rhododendron catawbiense, Kalmia latifolia, Rhododendrum ponticum in varieties, and other choice hardy hybrids: many of them stand 5 to 6 feet high, and the same through, and literally covered with flower-buds.

Messrs W. R. and Sons are happy to say that their Dwarf and Standard trained, and other Fruit Trees, are this season remarkably fine; they have also a splendid lot of fruiting plants of Peaches, Nectarines, and Apricots in pots, which can be recommended as being exceedingly fine.

NEW PLANTS.

Messrs. William Rollisson and Sons are now prepared to offer the annexed:—

COLEUS BLUMEI PECTINATUS.—This variety is a great acquisition; the foliage is variegated similar to Coleus Blumei, but the leaves are beautifully laciniated; 7*s.* 6*d.* each.

MANDIROLA ROEZLI.—A very fine flowering gesneraceous plant, producing fine spikes of lilac coloured blossoms, 15*s.* each.

ORTHOSIPHON SPICATUS.—A beautiful new greenhouse plant from Oeano, much to be desired for its foliage alone, which is deliciously fragrant; the flowers are large and white; 10*s.* 6*d.* each.

MANDIROLA LANATA.—A very curious free flowering gesneraceous plant of a delicate violet colour inside the mouth of the blossoms, and shaded lilac outside; 15*s.* each.

NEW CHRYSANTHEMUMS.

The Undermentioned can be supplied at 24s. per dozen.

Aureole, Aigle d'or, Arc-en-ciel, Adèle Prissette, Alexandre Pelé, Comtesse de la Chastnes, Créole, Duruffe, Danais, Eldorado, Fortunio, Figaro, Fimbriata rosea, Homène, Iris, Il Brasiero, Io, La Promise, La Carmélite, General Lafont, Mdlle. Clemence, Néréide, Precarieuse, Parpaillot, Rachel, Robert Bruce, Rose Bouquette, St. Agathe, St. Flore, St. Thais, Stellata Globosa, Trophée, Uranie, Vicomte de Caumont, Vicomte de Macarthy, Zenobie.

The Nurseries, Tooting, London.

MYATT'S ADMIRAL DUNDAS STRAWBERRY.—Strong plants packed and delivered free in London, 25*s.* per 100. Also Myatt's British Queen, Cinquefolia, Globe, Eliza, Mammoth, 3*s.* 6*d.* per 100; Keens' Seedling, Hooper's Seedling, Black Prince, Bicton Pine, 3*s.* 6*d.* per 100.

MYATT'S BRITISH QUEEN.—In reply to several correspondents, and in confirmation of the private answers I gave last summer, I beg leave to state that the only Strawberry bearing the name of "British Queen" is Myatt's, and when Mr. Beach, in his advertisement says "his true British Queen," he is obviously in error, and arrogates to himself the credit due to my late father, Mr. Joseph Myatt, who was the originator of the variety in question.—W. Myatt, Manor Farm, Deptford.—Sept. 1.

AZALEAS AND ERICAS.

W. J. EPPS has much pleasure in offering the following fine, bushy, well-grown plants, and of the choicest and best varieties, in large 48 and 32-size pots.

AZALEAS 18*s.* per dozen; 5*l.* per 100.
ERICAS 12*s.* and 18*s.* per dozen; 4*l.* and 5*l.* per 100.

These will make very pretty specimens for the ensuing season; all orders to be accompanied with a remittance from unknown correspondents.—Maidstone, Sept. 1.

CHOICE NEW FUCHSIAS, ETC., OF THIS SEASON.

HENRY WALTON, Florist, &c., Edge End, Marsden, near Burnley, Lancashire, is now sending out "the White Corolla'd," and "Banks," and other new Fuchsias, at 18*s.* and 21*s.* per doz. (nice healthy plants), post free or hamper and package included, or 2*s.* 6*d.* to 3*s.* 6*d.* each, for names of which see Advertisement in *Gardeners' Chronicle* of August 11th and previous Numbers.

New Verbenas of this season, 15*s.* per doz, or 1*s.* 6*d.* each. Choice Cineraria seed saved from the finest named varieties, 1*s.* 6*d.* and 2*s.* 6*d.* per packet, post free.

Post-office Orders are respectfully requested, with all orders (unless reference is given) payable at Marsden, Lancashire.

SPLENDID DUTCH ROOTS, ETC.

W. STEWARD, late Superintendant for W. E. RENDLE & CO. (before selling by public auction) begs to offer a consignment of the above at the following Low Prices till September 16.

No. 1, a splendid and extensive collection	£3	3	0
No. 2, " smaller quantities	2	2	0
No. 3, " " "	1	1	0
No. 4, a small good collection	0	15	0

Packets of superb Calceolarias, Cinerarias, Primulas, and Geraniums, 1*s.* 6*d.* and 2*s.* 6*d.* each, or the four for 3*s.* 6*d.* or 7*s.*

All orders will be executed in strict rotation as received, till the consignment is disposed of.

Orders above 20*s.*, Carriage and Packages free; above 42*s.*, for cash with order, Cost of Post-office Order and 5 per cent. may be deducted. Reference required from unknown parties.

A complete Seed Catalogue published shortly, which we shall be happy to forward in all orders, and to any address, on receipt of two postage stamps.

Stores near the Great Western Docks, (S. D. R. T.)
Stonehouse, Plymouth.

Kennard Brothers, Swan Place, Old Kent Road.

HORTICULTURE IN ALL ITS BRANCHES.

JOHN WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

THE NOBILITY and GENTRY about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Horticultural Establishment and Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUS, which passes through all the Houses and Pits affording both top and bottom heat, is in constant operation and particularly worthy of attention.

Many of the Houses and Pits are of wide and lofty dimensions, and together equal in length 1000 feet. They are all effectually heated by *one boiler*, which, during the severe winter months does not cost in labour and fuel more than 3*s.* 8*d.* per day, and the apparatus is so arranged that each House or Pit may be heated separately and to the required temperature. The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings: also Catalogues of Plants, Vines, Seeds, &c., forwarded on application to John Weeks & Co., King's Road, Chelsea, London.

HEATING BY HOT WATER.

JOHN WEEKS & Co., King's Road, Chelsea, Horticultural Builders and Hot Water Apparatus Manufacturers. At our two Establishments horticultural science is fully carried out in all its branches.

The accompanying sketch represents our Improved Boiler. These Boilers are very powerful, durable, and economical. The whole of our extensive nursery establishment is heated by *one boiler*, measuring only 5 ft. by 3 ft. 6 in. The Houses heated consist of forcing-houses of various descriptions, many of them are of wide and lofty dimensions, in length 1000 ft., and exposing to the atmosphere upwards of 16,000 superficial feet of glass. During the last severe winter it only cost us 3*s.* per day for fuel, and we had more than a sufficient command of heat. Any number of forcing-houses can be heated by *one of our Boilers*, and any part regulated at pleasure. Plans, Models, and Estimates of Horticultural Buildings, or Heating by Hot Water, forwarded on application.

John Weeks & Co., King's Road, Chelsea, London.

COTTAM AND HALLEN, Engineers, Founders, &c.,

2, WINSLEY STREET, & 76, OXFORD STREET, LONDON.

A SHOW ROOM DEVOTED ENTIRELY TO ARTICLES OF HORTICULTURE.

ILLUSTRATED CATALOGUES UPON APPLICATION.

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK,

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

STRAWBERRIES.

NEW STRAWBERRIES.—The following fine varieties have been thoroughly proved this season, and given the greatest satisfaction, viz.:—Sir Harry (Underhill's), 2*l.* 10*s.* per 100, or 7*s.* 6*d.* per dozen; Caroline Superb (Kitley's), 1*l.* 10*s.* per 100, or 5*s.* per dozen; Omar Pacha (Ward's), 1*l.* per 100, or 3*s.* per dozen; Colonel Dundas, 1*l.* per 100, or 3*s.* per dozen; Sir Charles Napier, 1*l.* per 100, or 3*s.* per dozen; Magnum Bonum, 15*s.* per 100, or 3*s.* per dozen; and all other fine old varieties, such as Trollop's Victoria, Ajax, Ruby, Eleanor, Nimrod, Prince of Wales, British Queen, Black Prince, Prolific, Keens' Seedling, and all others worth cultivating, at 4*s.* per 100.

SEEDLING HOLLYHOCKS, not to be surpassed, saved from all the finest and best varieties now in cultivation, and such as will bloom well next season, 1*l.* per 100, or 3*s.* per dozen.

SWEET WILLIAMS, from 50 of the most select and choice varieties ever grown, 4*s.* per 100, or 2*s.* 6*d.* for 50.

ANTIRRHINUMS.—Plants saved from a most splendid collection of striped and spotted varieties, 4*s.* per 100, or 2*s.* 6*d.* for 50.

FINE SCARLET GIANT BROMPTON STOCK.—White ditto, Crimson ditto, all 4*s.* per 100, or 2*s.* 6*d.* for 50.

The Plants before mentioned are now ready for planting out, and are such that must ensure satisfaction, and the whole or any part of the above will be sent, securely packed, on the receipt of a post-office order or penny postage stamps to the amount; or 25 of any of the new Strawberry Plants can be sent by post, when the charge will be 1*s.* extra for postage.

SEEDS. SEEDS.

HOLLYHOCK, saved from all the finest and best varieties in cultivation, 1*s.* per packet.

SWEET WILLIAM, saved from 50 distinct vars., 1*s.* p. packet.

ANTIRRHINUM, saved from a most splendid collection of striped and spotted varieties, 1*s.* per packet.

The True Old BATH COS LETTUCE (the best ever cultivated), 1*s.* per packet.

*** Every order must be accompanied by penny postage stamps, or post-office order payable to

EDWARD TILEY, NURSERYMAN, SEEDSMAN, and FLORIST,
14, Abbey Church Yard, Bath, Somerset.

KEENS' SEEDLING STRAWBERRY.—True and strong plants of the above sort for potting and bedding out can now be obtained from the grounds in which it was originally produced, on application to WARLEN'S (late KEENS') Gardens, Isleworth, Middlesex. Price 5*s.* per 100.

WARD'S OMAR PACHA STRAWBERRY.

WILLIAM JAMES WARD offers the above handsome fine flavoured Strawberry at the following reduced price:—100 plants, 1*l.*; 50 plants, 12*s.*; 25 plants, 7*s.*, strong and well rooted. In addition to the many flattering testimonials received last season, Dr. LINDLEY describes it as being exhibited at Chiswick, July 11, 1855:—"*Excellent in quality as well as attractive in appearance.*" See *Gardeners' Chronicle*, Leading article, July 14, 1855. The Editor of the "Florist and Fruitist," in the August Number report of the Exhibition at Chiswick, says—"WARD'S *Omar Pacha is a new Strawberry, and considering its high flavour and comparative hardiness is a valuable acquisition.*"

A few last year's plants 5*s.* per dozen.

Prospect Hill, Reading, Berks.

NEW STRAWBERRIES AT REDUCED PRICES.
GROWN AND OFFERED FOR SALE BY

WILLIAM J. NICHOLSON, Egglescliffe, near Yarm, Yorkshire.—The following splendid varieties have been well proved this season and given complete satisfaction, viz., Sir Harry (Underhill's), 100 plants, 4*l.*; 40, 1*l.* 18*s.*; and 20, 1*l.*; or 12*s.* 6*d.* per dozen. Omar Pacha (Ward's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Scarlet Nonpareil (Patterson's), 2*l.* per 100; 1*l.* per 50; 12*s.* per 25. Sir Charles Napier (Smith's), 1*l.* per 100; 12*s.* per 50; 7*s.* per 25. Admiral Dundas (Myatt's), 1*l.* per 100; 12*s.* per 50*s.*; 7*s.* per 25. Nicholson's Ajax, Ruby, Captain Cook and Fill-Basket, 6*s.* per 100; Ingram's Prince of Wales, Nimrod, Eliza (Rivers's), Surprise (Myatt's), and Bicton Pine, a large white one, 6*s.* per 100; British Queen, Black Prince, Eleanor (Myatt's), Old Pine, Trollope's Victoria, Goliah (Kitley's), Keens' Seedling, Old Roseberry, all at 4*s.* per 100; Crystal Palace, a very large and late variety, 10*s.* per 100. Post-office Orders payable at Yarm are expected with all orders. The plants will be securely packed and forwarded to any part of the kingdom.

RHODODENDRONS.

JOHN WATERER begs to announce that he is now prepared to execute orders for his two New Hardy Hybrid Rhododendrons, in good established plants, at 42*s.* each.

Rhododendron JOHN WATERER, colour glowing carmine, large truss, fine foliage, and a most abundant bloomer, in perfection about the 15th June.

Ditto, MRS. JOHN WATERER, a bright rosy crimson, fine conical truss, a very free blooming kind, in flower about 15th of June.

To the admirers of this justly noble class of Plants, JOHN WATERER has the pleasure of recommending the above as being the greatest acquisitions yet offered. They combine in a marked degree the necessary requisites for really first-rate hardy crimson varieties, viz., imposing colours, abundant bloomers, extreme hardiness, and flower at a time when they are not liable to be injured by spring frosts.

The American Nursery, Bagshot, Surrey, Sept. 1.

"SIR HARRY."

THE EMINENT SUCCESS of this new SEEDLING STRAWBERRY at the only Floral and Horticultural Exhibitions where it has been shown, induces the Proprietor (hitherto an amateur grower only) to offer it for sale. To this Strawberry has been awarded at all the Horticultural Exhibitions, where it has competed, the highest honours, namely:—

1854.—Chiswick, first class certificate; 21, Regent Street, highly commended; Botanical Gardens, Edgbaston, first prize.

1855.—Edgbaston Botanical Gardens, first prize, in pots (forced); Handsworth and Lozells, Hampstead Park, first prize (forced); Edgbaston Botanical Gardens, first prize—the Judges declared it the best Strawberry in every point on the table, superior to Keens' Seedling, Cremorne Seedling, British Queen, Mrs. Trollope, &c.; Lancaster, first prize, and pronounced by the Judges to be the finest and best tasted Berry in cultivation; Preston, first prize; Carlisle, first prize; Wolverhampton, first prize, and certificate of merit; Watford, extra prize; Aylesbury Horticultural Society, first class certificate.

The characteristics of the Plant are these.—Ripening as early as Keens' Seedling, but continuing fruiting a much longer time; a great cropper, bearing a very large handsome dark crimson berry, which carries that superb colour not only quite through, but to its very end, whilst being both firm and juicy, it separates itself entirely from its calyx, without having a tasteless core. The delicious and luscious flavour of the fruit, united with its high perfume, throws utterly into the shade the Keen and British Queen. The leaves are few, and the vigorous extension of its bearing branches exposes the fruit to the ripening influence of the sun, the want of which exposure is a great failure in many sorts of this class of plant. An oil painting of a one-year old runner, with its gigantic fruit in the respective stages of growth (as sketched from nature), is now in the Paris exhibition.

Plants are ready for sending out (not less than a score).

Prices:—100 plants, 4*l.*; 80, 3*l.* 13*s.* 6*d.*; 60, 2*l.* 16*s.*; 40, 1*l.* 18*s.*; and 20, 1*l.* Plants may be had in pots (not less than 10), at 2*s.* each.

Apply to Mr. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham. Each application to be accompanied with a Post Office Order (on Birmingham), to receive attention.

For the Cultivation of Strawberries, refer to Mr. Underhill's Treatise, price 1*s.*, which may be obtained from a Bookseller in every principal town, where also may be had a handsome Lithograph of the Oil Painting, price 3*s.*

TESTIMONIALS.

From the *Gardeners' Chronicle*, August 1854.—The Strawberry "Sir Harry."—Reading in your last number a letter from Mr. D. Beaton, describing the Chiswick Fête, I noticed the following observations about two new Strawberries there exhibited:—'I recommended two sorts of the Strawberries to my late worthy employers, Sir William and Lady Middleton, as most useful in the dessert, but whether they are of good flavour is more than I know. The kinds were the Bicton White Pine Strawberry, and a very dark one from near Birmingham, the name is Sir Harry. This was sent by Mr. Underhill, of Edgbaston.'—Having for many years had much experience, and taken great interest in the cultivation of fruit, I called upon Mr. Underhill for the purpose of making more particular inquiries, and possessing myself of some information as to flavour, &c., which Mr. Beaton could not give. Mr. Underhill politely invited me to walk through and inspect his beds, when I was perfectly astonished at the enormous size and deep colour of the fruit, combined with the excessive cropping of the plant. I then tested the flavour with Keens' Seedling and British Queen (both equally well ripened) when its superiority to either was so evident, that I pronounce it the most exquisitely flavoured berry I have ever tasted. It is both firm and juicy, and carries its rich red colour entirely through. The other distinguishing characteristics of the plant are these: its leaves are few, and it spreads its bearing branches out so wide as to thoroughly expose the fruit to the full influence of sun and air. For the information of horticulturists, and in justice to the excellence of the seedling, I shall feel obliged by your inserting this letter in your next weekly number.—I am, Sir, yours, &c., JAMES BOUCHER, formerly head gardener to Lady O. B. Sparrow, King's Heath, Worcestershire.

"Extract from an article in the "Florist and Fruitist" of September, 1854, written by Mr. J. Powell, of the Royal Gardens, Windsor and Frogmore, on new Seedling Strawberries.—'Sir Harry.' A fine variety raised by Mr. Underhill, of Edgbaston, Birmingham, and originated by seed of British Queen, impregnated with Hooper's and Keens' Seedling. The berries are exceedingly large, and very dissimilar in appearance to other kinds, mostly of a thick cockscomb form, and sometimes wedged shape, with large calyx, and long stout fruit stalks. Its colour is deep purplish red or mulberry, glossy, and ripens well throughout. The flesh is red, solid, and fine grained, juicy, and saccharine, with a delicious perfumed flavour.' The above description was taken through the kind permission of Mr. Underhill, from the fruit exhibited at Chiswick, in July last, for which he deservedly received a first class certificate."

"Preston, July 21, 1855.

"SIR,—Your Strawberry was greatly admired during the whole afternoon; in fact, it seemed to be the greatest attraction in the Exhibition. Will you let me know, as soon as convenient, the price of Plants, and how early in the autumn you will be ready to supply orders.—I am, dear Sir, yours respectfully,

"RICHARD TEEBAY,
"Secretary to the Preston Floral and Horticultural Society.
"R. Underhill, Esq., Sir Harry's Road, Edgbaston, Birmingham."

"Glasgow, August 13, 1855.

"DEAR SIR,—We inclose Post-office orders in payment of your account (which please return discharged), and we have much pleasure in bearing testimony to the superior excellence of your Seedling Strawberry 'Sir Harry,' which fully merits the high commendations given of it in the printed circulars you sent us. Without solicitation we write this, because we consider it a duty to commend what is really deserving, as it is to condemn such varieties of Plants, Flowers, and Fruits, as are too often foisted on the trade and the public, with equally high characters, but only to cause disappointment to growers.—We are, dear Sir, yours truly,

"DRYSDALE & Co.
"Mr. R. Underhill, Edgbaston."

"Aylesbury, July 27, 1855.

"SIR,—We feel great pleasure in informing you that the two splendid dishes of Strawberries shown by you at the Aylesbury Floral and Horticultural Society, July 26th, and called the 'Sir Harry,' were considered by all present the finest ever shown in the neighbourhood, both for flavour, colour, and size, and for which a first class certificate was awarded.—We remain, yours respectfully,

"J. F. FRASER, } Secretaries.
"H. MARGESSON, }
"R. Underhill, Esq., Sir Harry's Road, Edgbaston, Birmingham."

"Aux Sablons, near Morêt, Sur Loing (Seine Marne),
"July 4, 1855.

"DEAR SIR,—I have much satisfaction in announcing to you the result of my crop of 'Sir Harry' Strawberry. I must confess that I have never eaten anything so delicious, and I assure you that you did not speak too highly of the qualities of this beautiful fruit, which, in reality, is far superior to any other known, and consequently cannot fail to find its way into the garden of every amateur. The plants which I have kept under glass proved that 'Sir Harry' is equally well adapted for forcing—it even seemed that its fruit had a better flavour than those grown afterwards in the open air. Several of my friends having seen your 'Sir Harry,' and lithograph of the same, might desire to possess it. If you have to spare some plants for September next, will you be kind enough to let me know the price at your earliest convenience? I trust my letter containing some remarks on your French Treatise on the 'Cultivation of Strawberries' safely reached you, and hoping soon to have the pleasure of hearing from you,—I remain, dear Sir,

"Yours very truly and respectfully, FERD. GLOEDE.
"R. Underhill, Esq., Sir Harry's Road, Edgbaston, Birmingham."

"Bellaney, Ireland, July 10, 1855.

"DEAR SIR,—I feel that I should be really ungrateful did I longer delay writing to you, to say how truly the 'Sir Harrys' have merited the character you have published of them. My opinion is that they are extremely large, splendid colour, good shape, superfine flavour, and ripening so equally all through, which is the more to be appreciated when their great size is to be taken into consideration; this latter merit is superinduced greatly by the very small quantity of leaves in proportion to the fruit. In fact, to sum up all, they are the best bearers, and the best Strawberry I have ever seen.—I have the honour to be, &c., dear Sir, yours most respectfully, THOMAS W. BLANDFORD."
"R. Underhill, Esq., Sir Harry's Road, Edgbaston, Birmingham."

"Lancaster, July 20, 1855.

"DEAR SIR,—According to promise I now enclose you the Prize Ticket for 'Sir Harry,' upon which you will find the remarks of the Judges. The dish of 'Sir Harry' was literally besieged with admirers from the opening to the close of the exhibition, many were the inquiries for the owner, and having in my capacity to remain in the room all day, visitors soon found out that you had returned home, and also that you had kindly presented me with the fruit on the termination of the show. So numerous were the wishes of ladies and gentlemen to taste the berries, that I promised them I would send half a dozen in each instance, and you would hardly credit it, when I tell you that when I returned to my house I found it full of servants waiting with plates and baskets, in so great a number, that even the very large dish you specially brought for my own use, together with those exhibited, were distributed down to one dozen berries which I reserved to take home.—And believe me, faithfully yours,

"THOS. D. TOWNLEY,
"Hon. Secretary to the North Lancashire Horticultural and Floral Society.
"To Richard Underhill, Esq., Edgbaston."

MR. RICHARD UNDERHILL, Sir Harry's Road, Edgbaston, Birmingham.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 1, 1855.

IN our article of last week on the improbability of Hops which have been dressed with sulphur being really injurious to beer, we drew attention to the fact that no part of the sulphur was at all likely to enter into the organic tissue of the plant. Any portion of that substance, therefore, which could possibly impair the flavour of the beer must be attached to the outer surface.

Now, if it is remembered how liable the dressing is to be washed off by rain or dispersed by the wind which eddies amongst the tall hop-poles, it is not very likely that any quantity which could possibly prove injurious should adhere to the bur when picked and carried to the ost-house. Indeed, that no great quantity can remain a few days after the dressing is proved by the necessity, in many cases, of repeating the application, which would not be needful if there were still a fresh supply to be acted upon day by day by the oxygen given off from the plant.

If a chemical solution, as of sulphuret of calcium or potassium with the addition of an acid, were applied, from which a precipitate would be formed following every inequality of the leaves and in close contact with them, the sulphur might indeed remain more permanently on the plant than when it is administered by the dredging box or fumigator. But to place the matter beyond mere reasoning or conjecture, we have examined a specimen of Hops gathered by ourselves in 1854, in a garden where sulphur had been largely and successfully applied. No sulphur could be traced by ocular inspection, and on burning a considerable quantity not the slightest trace of sulphurous acid could be detected, either by its peculiar stifling odour, or by the application of litmus paper, which would have been bleached had any been present.

We trust, however, that the subject will be taken up by persons resident in the Hop districts who have better opportunities of investigation than ourselves, for it is highly necessary that the truth of the case should be ascertained. If the sulphur is really injurious, its use should of course be rejected; but if the truth is on the other side, it is not for the public benefit that curative measures which seem really to be attended by success when properly applied, should be impeded by a despotic manifesto. *M. J. B.*

In saying this we by no means charge the Hop factors with intentional misrepresentation. Doubtless they announce what they believe to be true. But is it true? Is there anything in their circular which contains a shadow of proof that sulphuring the growing Hops produces the injury alleged? Certainly not. This will be manifest if the notice from the Hop factors, which we now print in another column, is attentively considered.

Their first assertion is that brewers have sustained "serious losses;" a second that this has been caused by "the application of sulphur" to the growing crop. It is obvious that the two statements have no necessary connection with each other. We may grant that large losses have been sustained by brewers; for this is always the case, whether growing Hops are sulphured or not. That the sulphur dressing has been the cause we must wholly disbelieve until some clear proof of the fact shall have been adduced. Who have sustained the losses in question? Whose Hops were used when the losses took place? What evidence is there that the one fact has anything to do with the other? The beer may have been spoiled by many other causes. We have heard of such a plan as using picric or carbazotic acid, an intensely bitter deleterious substance, to replace Hops; we have known other contrivances, and without pretending to say that the instances of loss alluded to by the Hop factors are traceable to this cause, the public is entitled to require proof that they were caused by Hops saved from mildew. We have the greater right to insist upon this, because we are in a

condition to prove that when a bag of the Hops thus unceremoniously condemned and a pocket of the growth of 1852 or 1853 have been mixed together, beer of the finest quality has been the result. Another probable cause will occur to those who are familiar with Hops; it is notorious that those which come from the United States and Canada have usually a bad taste, owing to some defect in their preparation or packing. The quantity of foreign Hops last year imported was very large. The Hop growers may fairly require to know that the losses in question were not attributable to the employment of foreign instead of home-grown Hops.

The circular goes on to say that "it is now practically ascertained beyond all question" that sulphured Hops spoil the beer. Let us know the nature of this practical proof, how conducted, by whom and when. If, as we learn from the circular, this has been so positively made out, it is surely due from the factors to the growers, that the latter should be furnished with full particulars, and not be called upon to receive without question an assertion which, as far as it at present appears, rests on no evidence that can be produced.

The Hop growers have the more right to ask for proof, when they see upon what sort of reasoning the factors found their circular notice. The factors say that sulphur applied to Hops in drying does no harm; it is only "when actually *incorporated into the plant* by its application during its growth" that mischief ensues. Are we to understand from this that Hops absorb sulphur when applied to them in the open air, on the vines while in a state of growth? and that they refuse it when large doses are administered in the kiln? We should take such to be the meaning of the circular if it were conceivable that a body of intelligent men could really suppose the Hop growers capable of accepting such an extraordinary assertion without question. If Hops absorb sulphur at all it will be on the kiln. We have no reason to suppose that live plants are capable of absorbing through their skin any form of matter except such as is gaseous; and if living plants were to absorb sulphur in its gaseous combinations they could only do so at the expense of their lives. We therefore beg to withhold our belief from all statements to the contrary, until, as we have already said, they are accompanied by satisfactory proof. Let that be produced, and we shall be among the first to announce so great a discovery. In the meanwhile we rely upon the *proof to the contrary* mentioned in a previous paragraph.

We are far from supposing that the Hop factors have intended more, by the course they have taken, than to protect themselves and their customers the brewers. They probably overlooked the grievous wrong they were doing to the grower, or they thought themselves so sure of the ground on which they stood that no private interests could be considered. Upon either supposition we must take the liberty of calling upon them to prove their case, if they can. The subject is one of immense importance and cannot be treated lightly. As we have already said, we believe ourselves able to prove that Hops sulphured while growing do no injury to beer; we are, therefore, the more justified in requiring the factors to prove if they can that the losses they speak of have really been traceable to the use of the same article.

Sulphur is one of the most powerful of known agents in destroying mildew. It is to gardeners what vaccine is to surgeons. In horticulture it has been used for many years without imparting a bad flavour to fruit or other vegetable products. The sudden discovery that Hops are an exception to the rule might well then have excited our consternation, had not long experience convinced us that the supposed discovery must be in reality a delusion, caused by what we can only suppose to be hasty inferences drawn from insufficiently examined data.

We are now prepared to give the result of the experiments which, by the kindness of Mr. G. H. Hoffman, of Margate, we were enabled to make as to the germination of seeds which had been immersed in salt water. The method adopted for this purpose was explained before. There was no convenience for placing the little bags containing the seeds actually in the sea. Fresh sea-water was therefore supplied every day, and at the end of three weeks the bags were removed. The seeds were then so soft and swollen that it was impossible to transmit them without danger of their perishing on the journey. Measures were therefore taken to dry them sufficiently for package, and while quite damp they remained after their arrival, in consequence of our absence from home, four days without being unpacked. The immersion, therefore, was equivalent to one of more than a month. Sixty-one species were submitted to the salt water; but of these seven must be subtracted, as they had not germinated when placed meanwhile in common soil. The others consisted of 18 culinary plants, 15 endogens, and 20 exogens; 53 in all. Of the first the only ones which did not vegetate were Peas and Kidney Beans; of the second three did not vegetate; and of the third nine, being respectively one-ninth, one-third, and nine-twentieths.

The following tabular arrangement will show the result of the whole experiment at a single glance.

CULINARY PLANTS.

Germinated.	Did not Germinate.
1. Carrot	1. Pea
2. Spinach	2. Kidney Bean
3. Yellow Turnip	
4. Celery	
5. Onion	
6. Lettuce	
7. Capsicum	
8. Black Radish	
9. Corn Salad	
10. Endive	
11. Golden Cress	
12. Beet	
13. Cabbage	
14. Melon	
15. Aubergine	
16. Tomato	

ENDOGENS.

1. Oats	1. Colchicum autumnale
2. Wheat	2. Indian Corn
3. Barley	3. Uropetalum serotinum
4. Arum maculatum	
5. Bulbine annua	
6. Anomotheca cruenta	
7. Asphodelus luteus	
8. Babiana plicata	
9. Asphodelus ramosus	
10. Trichonema pudicum	
11. Sisyrinchium Iridifolium	
12. Iris triflora	

EXOGENS.

1. Monolopia californica	1. Godetia Lindleyana
2. Lupinus pubescens	2. Gilia tricolor
3. Cenia turbinata	3. Eutoca viscida
4. Godetia rubicunda	4. Cosmos luteus
5. Chryseis crocea	5. Campanula pentagonia
6. Erysimum Perowskianum	6. Nemophila insignis
7. Malope grandiflora	7. " atomaria
8. Fedia graciliflora	8. " maculata
9. Limnanthes Douglasi	9. " discoidalis
10. Silene compacta	
11. Nolana grandiflora	

Of these, Chryseis crocea germinated very imperfectly, though the single plant is still alive. The others succeeded as well as if the seeds had never been steeped, except the Lupine, of which the greater part of the seeds rotted, like those of the Pea, Kidney Bean, and Indian corn. Not a single Hydrophyl succeeded, though five were sown, and we were unsuccessful with the closely allied family of Phloxworts. In other families the number of species submitted to trial were too few to suggest any general probability, and it will be seen that while one Godetia failed the other succeeded. Seeds which have large fleshy cotyledons like Leguminosæ seem the most liable to decay, where the shell is thin and readily imbibes water, though it is believed that species with hard woody shells are amongst those which bear a long immersion the best. On the whole, out of 53 species 39 succeeded, or nearly three-fourths. So far, then, it is clear that immersion in salt water for a month is not sufficient to prevent the germination of a large quantity of species, and during that time a floating plant laden with seed might travel through many hundreds of miles. From the experiments of Mr. Darwin, however, which were made with artificial sea-water, it appears that a still longer immersion is not sufficient to prevent vegetation. Beet and Rhubarb germinated after immersion for 65 days, Oats, Canary seed and Capsicum, after 70; Cress, Lettuce, Radish, and Carrot after the same period, but only a few plants of each came up, Orach after 82 days, and Celery and Onion after 85 days. Mr. Darwin also instituted experiments on seeds thoroughly dried after immersion in salt water, but an unfortunate accident prevented his arriving at any results. *M. J. B.*

New Plants.

141. Pelargonium Endlicherianum. "*Fenzl. Abbild. und Beschreib. selt. Pfl. t.* 3." According to *Walper's repert.* 2, 820.

This is a handsome novelty and a great curiosity. It is a fleshy branched shrub, with soft, roundish, kidney-shaped, crenated, fragrant leaves, and trusses of large deep rose-coloured flowers, each consisting of two petals only, as in *P. tetragonum*. In addition to their deep ground colour the petals are boldly marked by rich crimson veins. The flowers on the specimen before us from the garden of the Horticultural Society are only five in a truss; but our wild specimens have *more than twenty*. The plant was received at Chiswick from Mr. Francis Rauch, in charge of one of the Austrian Imperial Gardens.

What gives so much additional interest to this plant is its native country. We need not say that the principal country of Pelargoniums is the Cape of Good Hope, a few species only being found in the Australian colonies. None had been observed in the northern hemisphere, except one species in the Canary Islands, and two or three in Abyssinia, until Kotschy in his travels in Caramania met with the present plant and sent it to Vienna. It occurred on limestone rocks, facing the east, in the ravines of the beautiful mountain region near the village of Güllek, where it was seen in flower on the 30th of July, 1853, as we learn from specimens in our herbarium. Güllek is not to be found in any map to which we have access, but we suppose it to be somewhere on the southern side of the Bulgar Dagh, or chain of Taurus.

A geographical parallel to this case is the occurrence of a species of Stapelia, another great Cape genus, on the south side of Sicily. The present plant will require a greenhouse in winter, and the more so because of the succulence of its branches; but it may be expected to prove a gay bedding-out plant in summer, and perhaps even the parent of a new breed of garden mules.

VEGETABLE PATHOLOGY.—No. LXXXVI.

356. Phylloptosis, Carpoptosis, Anthoptosis.—(*Accidental and Organic*).—Fall of the leaf, fruit, flower. In the last number those cases were considered in which a separation takes place between the stem of a leaf, or fruit, &c., and the base from which it springs when it has performed its proper functions, and is no longer wanted. There are, however, many cases in which leaves and fruit fall from constitutional or accidental causes, when these functions have not been performed. In most cases of sterility the separation takes place, either before or after the fruit shows signs of incipient decay, and the fall of blossoms and leaves without any previously diseased condition may take place, from excessive drought, moisture, cold, heat, &c. Thus on the approach of winter, at the first frost many leaves fall while yet green, and before they betray positive signs of decay, in which case, whatever may be the structure of suture by which the stalk is attached to the stem, it appears clear that the fall is the result of the antagonistic force between the depressed vitality on the one side, and the full vigour of life on the other, though we are not prepared to say in what the principle of life consists. In the case of drought, a fresh supply of water may reinstate the foliage in all its vigour, and separation will not take place, provided the drought has not been of too long continuance. The drought of the hot season in tropical climates strips many deciduous trees as effectually of their foliage as those of more temperate climates, where the foliage falls on the cessation of its functions by natural decay.

357. Land which has been flooded has a peculiar tendency to cause trees to cast their leaves, and a similar condition exists in conservatories where the pots in which the plants are grown are ill-drained, though in this case the dry air which surrounds them often increases the evil, the evaporation from the leaves being so great as not to be capable of being compensated by the more or less diseased or suffering spongelets. But even where the house is properly syringed, many plants still cast their leaves, in consequence, probably, of deficiency of light. In fact, all extremes seem to have the same effect. In plants which have been delicately treated all the winter, especially if they have been crowded, the first thing which takes place on their being exposed to the open air is the loss of many of their leaves; and precisely the same effect may take place under contrary conditions, though it is not uniformly the case. It should be observed that the fall of fruit in an early stage is not always due to want of impregnation. In the Scarlet Bean, for instance, after the flowers have been impregnated and the legumes have been formed, a single ungenial night will cause thousands to fall, which under other circumstances would have been perfected. It is because of some circumstance unfavourable to their healthy vegetation that the Peaches and Nectarines in Van Diemen's Land, as mentioned by Dr. Harvey, frequently fall before they are ripe, and are so seldom brought to sufficient perfection even for culinary purposes; and the same may be said of multitudes of plants cultivated in our conservatories and stoves. When the unexpanded buds of the Camellia fall we know at once that the condition of the roots is bad, while in other cases we are as sure that the temperature is not that which a healthy condition of the plant requires. A correction of such conditions, according to the exigencies of each plant, where practicable is absolutely indispensable to health or vigour.

358. Meyen remarks with regard to the normal fall of leaves that it is strongly affected by external climatic conditions, by which it may be delayed for a considerable period, or, on the contrary, be greatly accelerated. He remarks moreover that those plants which cast their leaves periodically exhibit surprising differences in this respect, for while some retain their dry leaves* for months, others part with them at the first frost, even those which are still green and in no respect discolored.

359. As we have considered the fall of fruit and other superficial organs under the same head as that of leaves,

* Oaks afford a ready example. The younger trees retain their leaves more tenaciously than the older, but in the same plantation great differences are observable, and the same remark is applicable to Beech trees.

it will be right to mention here the disease which is so fatal to Vines in many parts of France and other Continental districts, known under the name of *coulure*, or the premature fall of the inflorescence. This arises frequently from spring frosts, but it is also caused by poverty of sap, as is proved by the fact that removing a ring of bark a few days before the expansion of the flower entirely prevents the calamity, provided the temperature and other climatic conditions be favourable. The fall of the fruit is known by the same name, but in the Vine this can scarcely take place, except at a very early period of growth or when it is fully ripe. The fall of fruit in other cases may arise from anything which checks growth, and where the crop is too abundant, some privileged individuals appropriate the nourishment, and the others fall. *M. J. B.*

NOTES ON TRANSPLANTING.—No. I.

Autumn is at hand, and planting will soon be commenced. A considerable experience as a landscape gardener assures me that good practical knowledge on the subject does not generally obtain among those most interested in the results. If this, and the succeeding papers which I purpose writing on the subject, should in any way remedy that, I shall be pleased.

Professional men are, I believe, pretty well agreed as to the best time and mode of transplanting; and there are many excellent treatises from which, as far as principles are concerned, the amateur may glean the best advice, but while principles alone are of the highest value to the initiated, they often prove stumbling-blocks to the mere novice. To benefit him those principles must be illustrated both in the rule and in the exception. I hope to do that.

As a general rule the best season in which to transplant trees and shrubs is the autumn, from the last week in September till the same period in November. Evergreens especially should, if possible, be removed then. Of course they may be safely planted at other periods; in fact, there is scarcely a month in the year in which evergreens, under certain conditions, may not be transplanted with perfect success: but as a general rule, and in all operations of magnitude, some time between the periods named above should be chosen.

Deciduous plants should be removed between the decay of the leaf in autumn and the swelling of the bud in spring. So soon as the leaf begins to fade, is, however, the best time for the operation; but, as in the case of evergreens, the rule admits of many exceptions. These will be noticed in due course.

Of the comparative advantage of different periods of the year for removing evergreens, the following will furnish good examples. A year or two since a large number of shrubs and trees, principally evergreens, was removed under my directions. Circumstances which I had no influence over rendered it imperative that the operation of transplanting should be tardily proceeded with. In fact the work was begun in the middle of August and was hardly finished in the succeeding May. Every week during this long period, when the weather would allow, some shrubs were transplanted. I watched the results of these proceedings with great interest, and I confess to have gleaned some valuable information from them.

I should observe that the kinds of shrubs were principally Portugal Laurels, Laurestines, Arbutus, variegated Hollies, Sweet Bays, and Aucubas. Those moved in August suffered considerably in the loss of their leaves, especially the Laurestines, and assumed generally a yellow sickly hue. Others transplanted during the first 10 days of September succeeded little better; while those removed during the latter part of the same month, and in October and November, hardly indicated any effects of the operation. The weather, from the commencement of the work up to the beginning of November, was upon the whole dry. After this heavy rains set in and continued till the middle of January. The plants removed during that time did not start so freely into growth in the following spring as those transplanted in October and the early part of November. The soil, it may be observed, was a stiff loam, and, from being newly trenched, was rendered by the digging and treading, consequent on the planting, anything but favourable for the roots. To this cause may undoubtedly be attributed the comparative ill success of the plants removed then.

Towards the close of January frost set in and planting was suspended for a month; but during part of February and the whole of March and April the work was carried on, and, as the succeeding summer showed, with varying success. Those removed in March, however, on the whole suffered most, many of them, especially some large Portugal Laurels, died back to within a foot or two of the ground; others lost the greater part of their branches. These on being cut back made vigorous growth in the following year. Of all the plants removed I do not think more than half a dozen died outright.

Some of the shrubs transplanted in April deserve a special notice. Of these several were large Portugal Laurels, requiring the united assistance of eight or ten men to lift. As they were placed in very important positions every care was taken to ensure success by careful removal, and each was well watered when planted. The only indication of their having changed places was the casting of a few of the older leaves.

Notwithstanding the few failures, and the otherwise varying success, the result of the work on the whole may be considered as satisfactory. Two points in particular contributed to this success. The ground to be planted, from being trenched previously, had become thoroughly settled, and the plants themselves having to be carried but short distances received no material injury from being kept out of the ground. Whenever planting is to be extensively undertaken, much of the success will depend on timely preliminaries being carried out. It is too much the practice to procrastinate in this, and to defer the preparation of the soil till it is time to plant the trees.

Supposing the soil to require both draining and trenching, and in all new grounds these operations may be calculated on, by all means let them be finished in the summer preceding the planting season. If the soil is very stiff and unfavourable, a year's cultivation previous to planting would be of immense advantage; but under any circumstances trenching should precede planting at least several weeks if possible. The soil then becomes settled, and, from the action of the weather, well pulverised, and will be, in fact, in an excellent condition to receive the plants. The difference in the success of shrubs planted in a nicely pulverised and otherwise well prepared soil, and in one newly-trenched, stiff, and full of unbroken clods, is very great. In soils which require preparation much of the success of the shrubs to be planted in it will depend on its being timely and efficiently performed.

Two years ago I made plans for a new garden in the neighbourhood of London; the proprietor of the ground superintended their execution, and, with the exception of a preliminary visit at the commencement of the work, I did not see the gardens until the ensuing spring, when I was consulted as to the cause of the almost general failure of the shrubs. This was at once evident. The soil was very stiff—clay, in fact, and as it was trenched in the autumn and winter, and the plants immediately placed in it, it is easily imagined what kind of medium the roots enjoyed. The soil was in fact but a collection of lumps of clay with nothing to fill the interstices; nevertheless attempts had been made at planting—it would be libellous to say that it was really performed. The winds of March, assisted by the sun, had converted the lumps of clay into brick, and robbed the ill-covered roots of every particle of moisture: the plants were of course dead or dying, and no art could save them then.

In this case an early preparation of the soil was not only advisable but imperative, if anything like success with the shrubs was to be hoped for. Such a soil should be broken up a year before planting, and well worked at intervals to bring it into a proper condition. All soils will yield to well-directed labour; the end to be attained is merely a question of time, labour, and expense. Those who are unfortunate enough to have an unfavourable soil to deal with must incur all that if the best results are to be obtained. *G. W. L.*

GARDENING IN SOMERSETSHIRE.

I send you the accompanying design from a cooper's garden in this county from a neighbourhood singularly devoid of gardening or other taste; it is a Pyracantha in very full flower; every spray must have been watched

weekly. Cheiranthus Marshalli in marly soil makes an admirable bedding plant. Flowers are very pale this season, and fade very quickly, Laburnum unusually so. *Somerset.*

HOP DISEASE.

For years past I have urged my Hop growing friends when the mould attacks the leaves to dress them with sulphur, for I felt convinced that the mould would be as rapidly destroyed by its action as similar parasites are upon plants in our cultivation. The usual objections started have been the expense, the difficulty of application, and lastly, the resolution of certain Hop factors not to buy, except the grower would certify that no sulphur had been used in their culture.

In giving the history of what has occurred in the parish of Basschild, near Sittingbourne, in this county, I propose to say a few words on each of the objections. But first to the facts I wish to narrate. In the parish named may now be seen two adjoining Hop grounds belonging to two different growers. The variety of Hop is the Canterbury White Lime. Up to a month from this date, they were each in a similar state of health, when suddenly the mould appeared simultaneously upon each.

At this time the plants were not in blossom, although they were in each case nearly so. One of the growers commenced with sulphur, the other allowed the disease to range unmolested. A mere low hedge parts the grounds, and now to see the difference between the one and the other, even to the rows that nearly meet, would astonish and ought to convince the most sceptical, for in one ground of 5 acres there is every appearance of being 15 cwt. per acre, and in the other, the owner will probably not put a basket into the ground. Here, then, the experiment is conclusive as to the use of sulphur; and now let us look into the expense that has been the means of this success. The mineral cost 9*l.* only, and the labour of twice dusting the plants over the 5 acres was less than 3*l.*, but say 12*l.* for the extreme outlay. Then, whether we have 4 tons of clean good Hops to market, or whether we have our year's expenses and no produce, in this case is clearly whether we think it advisable to expend 12*l.* The argument upon expenditure is, therefore, put at rest. Next, the difficulty of the application. This need be no bar, seeing that the expense is less than 3*l.*; nor need we be alarmed at the difficulty, when we know that all that is required is a dredge or duster of tin capable of holding 1½ pints, and that it must be made to hold a stick or handle long enough to go over the top of the Hops. It must not be filled, and is better to have about one pint, which will then leave space to allow of shaking, which is essential to the operation. A slight jerk or a blow on the handle will scatter the dust over the top, and similar treatment will cover the leaves by going round the stool. In this manner, when the whole ground had been attended to, and every plant dusted over, it was observed that the whiteness of the mould had turned to a violet colour—a sure sign of the decay of the mould; but to prevent any chance of missing the infected branches and leaves, the same operation was again performed. From that time to the present the Hops have flourished—flowering as if nothing had occurred, and now presenting that peculiar beauty that a healthy ground is proverbial for.

Having disposed of the two first objections let us consider the third—namely, the grounds for the Hop factors' manifesto. It relates that certain growers, by the use of sulphur last year, grew Hops, and that the brewer using them spoilt the beer, and therefore they state that they will not buy Hops without a certificate that no sulphur has been used in the culture. Let us see how this doctrine would apply to our present case. Of course they would not buy the growth because sulphur *has* been used. Is not this the height of absurdity, for the sulphur was used before the plants were in flower, and consequently the Hop could not in any way be affected by it?

The gentleman who drew up this manifesto evidently supposes that sulphur would pass into the pores of the plant, and thus find its way into the Hop from the leaves and stems. This every physiologist knows to be a thing impossible, and consequently any deduction from it is simply absurd. It is now only necessary for me to conclude by stating that I possess a branch from each ground, and shall be happy to show them to any interested upon the question. *William Masters, Exotic Nursery, Canterbury, August* 29.

CIRCULAR ADDRESSED TO THE HOP-GROWERS OF KENT AND SUSSEX.

The very serious losses which brewers have sustained from the application of sulphur to the growing crop of Hops, with the view of checking the spread of mould, render it our duty to call the attention of the Hop-growers generally to the subject, and we would hope that it will only be necessary to make them acquainted with the disastrous results of the practice to ensure its discontinuance.

It has now been practically ascertained, beyond all question, that Hops grown under such treatment impart so obnoxious a smell and flavour to the beer brewed from them as to render it unsaleable, and, unhappily, we could multiply instances of losses arising from this cause, to the extent of thousands of pounds.

It would appear that while sulphur, in moderation, applied in vapour during the process of drying Hops, produces no deleterious effects, when actually incorporated into the plant by its application during its growth, it impregnates the beer with its flavour to such an extent as to render it undrinkable.

As large purchasers of Hops we shall feel bound, for the protection of our customers, to require some guarantee from those of whom we buy them that any lots offered to us for sale have not been sulphured while on the poles; and without obtaining such an assurance, we shall be obliged to decline their purchase.

This subject, however, appears to us to be of the most vital importance to the growers of Hops themselves, as the practice, if not abandoned, must encourage the consumers in the use of foreign Hops, which have already been so extensively introduced and found favour; for as mould is comparatively unknown abroad, the brewers

will have no apprehension in their use of suffering from the remedy adopted in England for the cure of that disease.

Knight; R. and T. Collis.

Home Correspondence.

Fences.—Observing of late several articles on fencing in your Journal, I submit that one kind may be suitable for one place but might not be so in another; for instance, a cold bleak country would like to have shelter and protection, whereas in warmer or more genial localities, the more fields are open to the influences of the sun and air and freed from hedge-row timber the better. At this moment I will more particularly consider the question of fences generally. Grant we have stone, iron, and different sorts of living stuff at command—stone-walls to many may be unsightly, but where quarries are near and stones large enough to make a jagged topping, make good fences, take up little space, are inexpensive and durable. The second I prefer to any other, viz., a good substantial iron hurdle, with 4 uprights, with an iron post buttressed alternately on either side, taking up no room, harbouring neither weeds nor vermin, removable from place to place, and has its worth as old metal. But what's the last?—balance the first and greater outlay with the second and lesser expenses; remembering, however, the annual outlay for keeping live fences in repair. I have nothing to say against the following kinds of hedges:—Hollies, Blackthorn, Quicks, or Sweetbriar mixed with Beech or Privet, but one and all of them require time to become real and substantial fences; all require two-sided posts and rails—often to be renewed, often stolen, always closely to be looked after; and if you will count your cost of labour, timber, and nails for 5 or 6 years, you will find a good deal of money has been disbursed. It may be asked whether it is better to plant your live fence on the surface of the soil or on a bank; if on a bank a ditch on either side to form it is usual, which cattle breast, and the ditches are trampled in and pouched, and the outflow of drains are stopped up if carried into them. If on the surface, it requires a long time before a substantial good fence can be got up; and if the fields are pastured with sheep, vacancies and gaps are sure to be made in it by being browsed. The best Quickset hedge I ever saw was made after this fashion—a wall of 18 inches high and 9 inches wide, with Quicks planted on both sides of it. Although an advocate (from experience) of an iron hurdle being the best and the cheapest in the end, it must be a strong one, with buttressed props; a slight one does not answer in any way the view I take upon the subject. *Rhyl.*——As regards mixing and rearing hedge plants no general rule can be laid down, for scarcely two men can agree as to what is the best hedge mixture. Soil and climate are the two most essential points to be studied in the rearing of plants adapted for hedging. In good soil and for agricultural purposes nothing can supersede the White Thorn. For ornamental and lawn fencing the kind of plants to be chosen must be left to the taste of the planter; a good many varieties of evergreen plants have been recommended, and many more might be named, all well adapted for forming beautiful hedges, provided such suits the owner's taste, and the soil in which they are to be planted. As to keeping hedges when reared, surely "A Northern" is acquainted with better implements than a pair of rusty scissors for clipping or cutting hedges; keeping the latter narrow at top instead of broad, which is generally termed "wedge-shaped," is certainly the best form. "A Northern" must have few hedges under his management if he can find time to dress them annually with a pair of scissors; I hope that he will try the implement mentioned by "A Yorkshireman" last week; Sanderson's (of Dunse) is the best hedge bill I ever tried, it can be had of any respectable ironmonger or seedsman. I have travelled in Scotland and in the north of England, and I can safely say that the best hedge fences I ever saw were wedge-shaped; they are the easiest kept, and with fair management live longest; they should be dressed annually. *The Far North, Abernethy, Strathspey, Scotland.*

My Flemish Pears have been much destroyed by myriads of yellow flies, and three remedies, which I have tried for them, have proved useless. I washed one tree with the engine, and while wet dusted it all over with soot. I allowed that to remain on four days and then washed it off. For another tree I used 2 lbs. of sulphur in solution, and for a third tobacco-juice. None of these applications, however, were effectual in removing the evil. Do you know of any remedy? Would it be well to give the trees liquid manure at the roots in order to improve the size of the fruit; and if so, is it proper to mulch with a view to prevent evaporation? Would mulching with Grass have a bad effect in preventing the sun's rays promoting the ripening process? Any information on these points would oblige *A Constant Reader, Cupar, Fife.* [Do not use Grass-mulching. As to the fly, before suggesting any remedy for it we must know what it is.]

Vanilla.—Having succeeded this spring in ripening a considerable number of Vanilla pods, a phenomenon has come under my observation which appears worth noticing, namely, the formation of very delicate needle-shaped crystals, both on the surface and in the interior of the pods when slowly dried. I suspect they will prove some peculiar alkaloid to which the plant owes its flavour. My mode of treatment after they were gathered was first to dry them slowly by hanging them up in the stove in which they had been cultivated; they were afterwards laid to dry in a warm sitting room, and finally put away in a wide-mouthed glass bottle, exposed to moderate light. Notwithstanding all the drying to which they had been subjected, one or two pods showed symptoms of mould, but the crystallisation of which I speak is quite distinct from this, the crystals being needle-shaped and prismatic, apparently triangular, about one-twentieth of an inch long and under. The interior of the pods where, in ripening, they have burst open, is quite brilliant with them. *J. Rogers.* [The crystals are understood to be of either benzoic or cinnamic acid.]

"Sir Harry" Strawberry.—In answer to the paragraph signed "Fragaria," in last week's Number, I have advertised in another column some few testimonials respecting this Strawberry from amongst numerous others which I have received from various parties. I was not aware, until I was favoured by the paragraph in question with the information, that this Strawberry was held in such slight estimation at the Horticultural Fête at Carlisle. Having had awarded it there the 1st prize, I of course imagined that the award of the judges at such an exhibition was right and indisputable. *R. Underhill, Sir Harry's Road, Edgbaston, Birmingham.*

Vine Disease.—I do not know whether it may be among the facts tending to throw light on the Vine disease, that in the case of our own houses the Grapes were first affected at the western end, the blight gradually passing on through the last month or more to those that until lately appeared quite healthy at the eastern end; and within a day or two I have observed that some of the leaves and branches are assuming the same mouldy appearance. All were, I imagine, quite healthy in colour until the early part of last month. The two houses have a southern aspect, are separated by a stone wall, and are ventilated from the roof. They receive but little care; but last year so few branches were blighted by the mildew as to lead to the hope these were accidental, and that the disease had not attacked the Vines. It is now unmistakeable. *L. P., Plymouth.*

Importance of Urine as Manure.—This, when allowed to become putrid, contains a large quantity of ammonia. This is clearly appreciable when it is stirred up, the effect produced being such as to affect the eyes similarly to salts of ammonia. This valuable manure then is easily attainable, inexpensive, and only requires the trouble of collecting. The exact quantity of this liquid that plants will make use of, or are capable of assimilating, I am unable to determine. But it is wiser and better to apply such substances weak and often than to furnish them in excessive doses. The proportions in which I have used it to Pine plants, vigorous growing soft-wooded stove plants, Vines in pots, &c., first allowing the liquid to become putrid, was 1 pint to a 4 gallon pan, and that the leaves of plants do to a certain extent absorb ammonia from the atmosphere is undoubted (see Dr. Lindley's "Theory of Horticulture"). I have, therefore, used the urine in the above proportion for syringing Pine plants; under such treatment the leaves assume a deep green and a robustness of growth which is not effected in the absence of such matters being applied. To Celery, Cauliflowers, Onions, Lettuce, and the like, I have used 1 quart to 4 gallons of water, with equally good effect. The above experiments were carried out in gardening, but they equally apply to farming. An easy method for the practical farmer to obtain a valuable manure, either to drill with Turnips or to apply as a top dressing to Wheat, would be to collect the parings of hedge banks, clay or strong loam, burn or char them, and soak them with the liquid. After burning or charring, such substances possess the power of fixing ammonia to a great extent. Such work could be carried out on a farm, as well as in a garden, when the weather in winter would permit of little else being done. *G. G. W.*

Transplanting Large Trees at Gunnersbury Park.—Mr. Barron is mistaken in stating that the major part of the trees here were moved under his direction or that of his man. Such superintendence certainly did not extend to more than a fourth of the number transplanted here last autumn; and with the exception of the large Douglas Fir, a Spanish Chesnut, the Cupressus macrocarpa, many equally large as he transplanted, such as Deodars, Cryptomerias, &c., from 10 to 20 feet in height, were moved by myself, and as you have correctly reported, with perfect success. I observe that Mr. Barron attributes the loss of the top of the Douglas Fir to its toes having been too closely pared. This may or may not be the case. Throwing out a trench round a tree in spring, as was done in this instance, and filling up with prepared soil to induce fibres previous to transplanting in autumn, is however considered by many safe practice. *Wm. Forsyth, Aug.* 30.

Transplanting Machines—Which is the Best?—Without entering into the merits or demerits of the different transplanting machines now in use, I have thought that an excellent way of settling the matter would be by a public competition at such places as might be agreed upon, giving the competitors a certain number of equal sized trees to transplant, the kinds of trees and conditions of soil, &c., to be as near the same as possible. This would certainly aid in settling the many conflicting opinions as to the cheapest and most efficient contrivance for the purpose. It would of course take some time to settle the success or otherwise of the trees and shrubs lifted, but a year or so would also determine that point. I think (it may be ignorantly), that Mr. M'Glashen's machine surpasses Mr. Barron's and I too could quote authorities in support of this view, but I prefer throwing out the above suggestion, leaving the animus of Mr. Barron's letter in last week's Number to speak for itself. *An Observer.*

Anacharis alsinastrum.—There is at Weybridge and Walton a land drain about 5 or 6 feet wide which empties itself into the Thames. Both at its upper end at Weybridge, and at its lower end at Walton, 2 miles apart, this plant is abundant. The drain, which is called the Engine River, runs for some distance through my land, and to any one calling on me I shall be glad to point out the plant. It bloomed very plentifully, and indeed nearly covers the whole bottom of the Engine River from end to end. *J. Cox, Clinton House, Weybridge, Surrey.*

How to make Yeast.—In your last Number is a recipe for making yeast; I send another from the "European Magazine" for 1790, which does not require yeast itself for a foundation as the one printed at p. 566 does. It seems to have been considered worthy of a prize 60 years ago. The following is extracted from the magazine above named, vol 18, p. 192:—Recipe for the Generation of Yeast.—A premium of 20*l.* having been given to Joseph Senyor, a servant of the Rev. Mr. Mason, from the Society of Arts, Manufactures, and Commerce, we think we shall oblige our readers by extracting from the Transactions of that Society the following recipe. Procure three earthen or wooden vessels of different sizes and apertures, one capable of holding two quarts, the other three or four, and the third five or six. Boil a quarter of a peck of malt for about 8 or 10 minutes in three pints of water, and when a quart is poured off from the grains, let it stand in the smaller vessel in a cool place till not quite cold, but retaining that degree of heat which the brewers usually find proper when they begin to work their liquor; then remove the vessel into some warm situation near a fire, where the thermometer stands between 70° and 80° Fahrenheit, and then let it remain till the fermentation begins, which will be plainly perceived within 30 hours; add then two quarts more of a like decoction of malt, when cool as the first was, and mix the whole in the second or larger vessel, and stir it well in, which must be repeated in the usual way as it rises in a common vat; then add a still greater quantity of the same decoction, to be worked in the largest vessel, which will produce yeast enough for a brewing of 40 gallons. *M. N., Aug.* 26.

Suffolk Natural History Club.—On the 26th of July Professor Henslow, with a party of naturalists from Ipswich, started a working club under the above name. The object is to examine the natural history of the entire county by excursions during the summer, and the establishment of correspondents in various parts of the county. It is hoped that by this means the natural history of the county will in a few years be pretty well explored; a correct record will be kept of all plants, insects, birds, or any other object in natural history which are met with during the excursions. Any person in the county desirous of encouraging and joining this club will do well to communicate their wishes either to Mr. Henslow, or to Dr. Drummond, of Ipswich. This club is considered to be in a certain degree in connection with the museum, and Mr. Knight, the active and intelligent curator, will gladly take charge of all specimens committed to his care which are intended to illustrate a complete Fauna of the county of Suffolk. If other counties will do the same, how much will be effected in a few years? The meeting on the 26th July was at Bentley, and Dadnish Wood was explored. Rain came on unfortunately in the middle of the day. *C. R. B.*

Æschynanthus, &c., without Artificial Heat.—In your Journal of the 14th July, you gave an extract from Hooker's "Journal of Botany" respecting the injudicious treatment of Orchids, in the keeping them in too high a temperature. Many other plants besides that particular class will be found to thrive without any artificial heat. I send herewith flowers from an Æschynanthus now suspended from the roof of my greenhouse, which has had no artificial heat, but actually stood several degrees of frost last winter. I have also Lagerstrœmia indica coming well into flower, trained against the glass of the greenhouse. Both these are usually, I believe, considered to be stove plants. *C. J. B., Abbotsley, Devon.*

The Dioscorea Batatas.—I fear this will prove one of the most complete horticultural flams we have had for a long time. In common, I suspect, with some hundreds of your readers, I purchased some tubers in February last and planted them in pots, placing the pots in bottom-heat in a forcing house. The shoots were a long time before they made their appearance above ground, seeming to require much heat; however, in May they progressed rapidly, so that by the 16th of June each plant had formed a tuber about as large as a nutmeg. On that day, after hardening them off, I planted them out, having first prepared a ridge on a south-eastern slope, the soil being a very light sand; this I stirred to 2 feet in depth, mixing with it a good quantity of rotten manure. I placed no glasses over them, considering that if it is really to prove a hardy esculent fit for general culture, such extreme care should not be required. And now for my success! By the 30th of June they were much less than when planted out; the heavy rains in July gave them a "heavy blow and great discouragement," and at this moment only two out of six are alive, and they have shoots perhaps 6 inches long.

In the extreme south of France, and in Spain, with careful culture, it may succeed, but with our cloudy skies and equable temperature, I fear it will not even reward the amateur gardener, who looks only for small returns after much labour. As an article of general culture it never can be of the slightest utility, and it is really a pity that so much was done in the puffing way with it. A very clever French gardener has made a fortune by it, and when he was with me a short time since I showed him my plants, telling him at the same time that I was aware it had filled his pocket, but that I thought it would never fill our stomachs. His sagacious grin and shrug were things worth looking at. *Yam.*

Notices of Books.

In a closely and admirably printed 4to volume, of 370 pages, Mr. Newdegate has collected *The Customs' Tariffs of all Nations, up to the Year* 1855 (Murray). Of such a work, if executed with care, as this evidently is, it is difficult to overestimate the importance as a book of reference by financiers and merchants. Even to those who only seek for general information the details of foreign tariffs possess the highest value, demonstrating as they do what products are abundant enough to be exported, and what in such demand as to be imported. Mr. Newdegate's avowed object has been to obtain better commercial information than is furnished to Parliament, and to collect in one volume the data upon which all changes in our own tariff should be founded. He has taken as the basis of his work Mr. Otto Hübner's "Commercial Tariffs," but to the information collected by that eminent statist in 1852 he has added all that has since been done in our own or other countries. So complete, indeed, is the compilation that Mr. Newdegate announces the tariffs of the Sandwich Islands, Nicaragua, Honduras, and the Mosquito Territory as being the only four he has been unable to procure.

Mr. Gosse has published the first part of a *Manual of Marine Zoology* (Van Voorst, 12mo), explaining the distinctions between the orders and genera of those curious animals which have become familiar even to Londoners through the marine vivaria in the Zoological Garden. The classification seems well managed, has the great merit of being concise as well as clear, is written wholly in English, and is illustrated by woodcuts which, although slight, are amply sufficient for the purpose intended. We can recommend it as a capital seaside companion for all who wish to know something of the zoology of their native shores. It will afford pleasure to the old, and excellent exercise to the young and intelligent. A good pocket lens will generally show all the structure with which it is necessary to become acquainted in order to understand Mr. Gosse's little book. The second part, to contain animals of a higher order, up to Mammals, is announced as being nearly ready. Much as we esteem the manner in which the author has proceeded in this attempt at popularising an obscure subject, we should have much preferred seeing the names of the orders Anglicised a little, by converting Poriphora into Porifers, Cirrhipedia into Cirrhipeds, and so on.

The Isthmus of Suez Question (Longmans & Galignani), is a pamphlet by M. de Lesseps, written with a view to showing the mercantile advantages of a ship canal connecting the Mediterranean and Red Seas. We believe it to be admitted by practical engineers that the operation, whether from the Bay of Pelusium, as M. de Lesseps proposes, or by the Gulf of Akaba, as Captain Allen suggests, is opposed by no difficulties that would be insuperable provided money enough is applied to the operation. But it strikes us that politicians, not engineers, are the persons to consult; and that the true question is not whether the plan is feasible but whether it is advisable. Upon such a point we have no opinion to offer. The reader who wishes to look at the subject from M. de Lesseps' point of view will do well to peruse his pamphlet, which is accompanied by two good maps of the country, and a third which was scarcely called for.

A Sunday Book for the Young (Van Voorst), is a nicely printed and plainly written account of the habits of patriarchal times in the East, as illustrated by the customs still observed in the unchanging countries once governed by Noah and his descendants.

Garden Memoranda.

ROYAL BOTANIC GARDEN, KEW.—This great public garden appears to be undergoing a thorough revision not only in one department but in all; and we have reason to believe that the spirit of improvement at present in operation here will not be satisfied till everything connected with it shall have put on an aspect very different from what it ever has done. For the magnificent collection of Aloes, Agaves, &c., now kept in an old lean-to house, better accommodation has been provided in the shape of a handsome new span-roofed greenhouse, which is all but ready for their reception. This is situated near the end of the large Orchid house, which is now almost wholly occupied with Ferns, the Orchids having been removed to another house, and is no less than 200 feet long and 26 feet wide inside measure. Its greatest height is 13½ feet, and it is glazed with green tinted glass, deeper coloured than that of the great Palm house. It is heated with four rows of hot-water pipes from one of Burbidge and Healy's boilers, and it is well ventilated, every second sash in the roof moving as well as those in the upright side which are set on a brick wall 3 feet in height. The bricks for this wall were obtained from an old New Holland house (No. 7), which has been pulled down for the purpose, and the plants which were wont to occupy it, but which are now out of doors, will, we are informed, be wintered in the old Aloe house, till the new conservatory is built.

The most important improvement, however, about to be effected here is the erection of a new museum, for which, as our readers have already been informed, a grant of money has been voted. The size and form of this building are, we believe, not definitively determined; but we understand that it is to be placed at the south-east corner of the garden, near the entrance from the Richmond Road called the Unicorn Gate. It is not intended to supersede the museum at present in existence in the garden, but to be as it were a kind of auxiliary to it, the objects worthy of exhibition in such places accumulating so fast that it has been found absolutely necessary to provide additional accommodation for them. Of the more important rarities treasured up here, some account was given at p. 451; that they greatly interest the public is certain from the numbers of persons that daily inspect them, even to overcrowding, and on that account it has been deemed better to have two moderate-sized buildings in different parts of the ground than one very large one, in order as much as possible to avoid this evil.

The supply of water to the plant houses has hitherto been maintained only by keeping an engine continually pumping it up to the top of a tower by the side of the lake; but it has been thought that if accommodation for storing up a greater quantity than could be done in the water tower alone could be provided, it would be more convenient, as well as economical, and to that end a reservoir has been formed under ground, on the summit of the rising knoll at the upper end of the lake. This is an oblong square, 25 feet in length, and 9 feet in depth, lined inside with Portland cement, and being turfed all over, can offer no unsightly object to offend the eye.

As regards the general collection of plants under glass, it appears to be in a better condition than ever we remember to have seen it. The services of a new cultivator (Mr. Brown, late foreman to the Messrs. Rollisson, of Tooting), have been obtained. The Orchids more especially have been put under his care, and since he has had them he has repotted nearly the whole of them, and otherwise placed them under circumstances as advantageous as the season of the year would permit. One great drawback to the successful culture of plants of this kind here, as indeed it must be in all gardens to whose houses the public has access, is the continual opening of doors in winter, by which cold air is admitted, and for this there is no remedy except shutting up the house during the coldest months. In summer, we need not say, the evil is but little felt. Pitcher plants have also all been fresh potted, and plunged in Moss at the warmest ends of the stoves, and the extensive and very valuable collections of Ferns which this establishment contains, and which Mr. Smith himself takes special care of, have also all been gone over and shifted wherever they required it; and some of the hardier New Zealand, Madeira and Mexican kinds that were planted out on a bank in a house with a north aspect have been lifted and potted, and replaced in the same house on terraces, faced with burs which will doubtless in time be covered with rock plants. The appearance of these Ferns may not at once be improved by lifting them and putting them in pots; but the operation has given them as it were more individuality, and their names are more conspicuous and accessible than they were before. Many of them have acquired a size which they could not have done had they been kept all their time in small pots.

The Victoria regia, both in the house specially devoted to its culture and in the large square slate tank of the old aquarium, is, we regret to state, not thriving. The water with which the tank is now supplied is loaded with a green slimy Conferva that fastens on the under sides of the leaves and rots them. Last year it grew and flowered tolerably well; but this season it is doubtful if it will blossom at all. Other aquatics, such as white, blue, and red Nymphæas, Nelumbiums, and even the Euryale ferox succeed as well as could be desired; but the water in which they are growing, especially that in the great basin of the new Victoria house, is anything but clear and pleasant to look at, and all that can be done to clean it has failed to make it better.

The Palms in the great stove have made much progress in growth since we last saw them: the different kinds of Cocos have already reached the top of the house, and other sorts have proportionately increased in size. Of Urania speciosa, we remarked a magnificent specimen with a stem quite 18 inches in diameter at the base. Some Bamboos have grown to the surprising height of 68 feet in 5 months. This includes a long period in their first stage in which they make little or no progress, but after they have attained a certain altitude they rush up at the rate of 2 and often 3 feet a day. Of Strelitzia augusta we observed very fine specimens, as well as of Seaforthia elegans, Sabal umbraculifera, and others. It may be worthy of notice that the great dead looking trunks of Encephalartos pungens received here some three years ago from South Africa, have pushed noble heads of leaves, and are now remarkable for their size and grotesque appearance. The various kinds of Cycas in the south end of this great building have also become objects of much interest.

Passing on to the Cactus house we remarked the change mentioned by our correspondent at p. 466, of raising the ground on which the plants stand, and edging it with Lycopods, and we agree with him that the aspect both of the place and plants is agreeably improved by the alteration. Most of the plants here, with the exception of some huge specimens of Echinocacti, have been re-potted, and the condition of others, where this was unadvisable, has been carefully looked to; in short, everything is being done to increase the interest which has always attached to this singular tribe of plants.

Of real novelty there was little. It will, however, be welcome news to many to know that some hundreds of young plants of the Pampas Grass (Gynerium argenteum) have been raised here from seed sent home from Buenos Ayres. It was sown in pans in peat and loam, mixed with a little sand and leaf mould, and placed in a cold frame. Treated thus it germinated freely, and the young plants have now nearly all been potted off into 3-inch pots. Among the useful plants may be remarked an extraordinary and new species of Sanseviera, with very large *terete* leaves, from Angola. Beautiful cordage made of this has been received by the Admiralty, and there are also samples in the great "Exposition" at Paris.

Out of doors the flower beds along the sides of the main walk and in front of the Palm-house are now in very good order, considering the heavy falls of rain we have had, which has somewhat impaired their brilliancy. The Grass too is in fair condition, considering the disorder occasioned by the pulling down one large plant-house and the erection of one still larger, and at no time during this season has the garden looked better than it does now. The herbaceous ground is very attractive, and we learn that a thorough revision of the names in it is in progress, under the direction of Dr. Hooker.

Among Conifers in tubs placed out of doors we remarked some noble specimens, more especially one of Araucaria Bidwilli, which could not measure less than 10 feet in height, and as much in width. Of the New Zealand Dacrydium cupressinum there was also a noble tree, as well as of Cunninghamia lanceolata and others. It may be worthy of mention that Araucaria Cooki, which, by-the-bye, is so like the Norfolk Island Pine (A. excelsa) as to be scarcely distinguishable from it, was injured by the frost which we had on the morning of the Chiswick exhibition on the 20th of June last, and other of the more tender Conifers, even the Funereal Cypress, also suffered slightly on that occasion. It is evident that many fine Mexican and other tender Conifers, as well as the larger greenhouse shrubs generally, are suffering from want of space, especially height, and of more pot or tub room. While speaking of the effects of frost, we may mention that no fewer than 2000 Scarlet Geraniums perished by it here last winter, and other bedding plants in proportion. They had been stored in pits to which no artificial heat could be supplied, and therefore there were no means of keeping the frost from them. This would indicate the advantage of running a hot water-pipe round such places. A good span-roofed pit has, however, now been put up here with the old lights from the New Holland house, and this has been efficiently heated with hot water.

SHRUBLAND PARK, NEAR IPSWICH.—I send you a report of a grand promenade concert held in the flower gardens here on Friday, the 24th inst. The promenade was in aid of the funds of the Ipswich Hospital. Princess Mary, the Grand Duchess of Mecklenburgh, the Duchess of Cambridge, and a very numerous assemblage of nobility who were guests at Shrubland, honoured the gardens with their presence. The bands of the Grenadier and Scots Fusilier Guards were in attendance. Upwards of 7000 people entered the flower gardens by the north and south entrances; not the slightest thing occurred to mar the pleasure of the gay and exciting scene; every one seemed highly delighted, and apparently felt grateful to Sir William and Lady Middleton, who with the Royal personages were loudly cheered when retiring from the gardens. *R. G. Foggo.*

FLORICULTURE.

HOLLYHOCKS.—A beautiful exhibition of these took place at Cremorne on Thursday last, a full report of which will be given next week. Much has been said of the beauty of French Hollyhocks, but they must be fine indeed if they surpass those of English growth. According to Mr. Paul, however, they are inferior to ours on this side of the channel. He says (see Hour with the Hollyhock), "I have taken considerable pains to visit the principal French collections, to ascertain whether they were worthy of introduction to British gardens. Those of MM. Pelé and Bacot, both in the neighbourhood of Paris, are the best. They are superior to old English varieties, but inferior to the modern ones. In conversing with the French growers, it was evident that the Hollyhock had not yet taken a very high standing in their country; they had not learned to view it critically; it had not, so to speak, become a Florist's flower; and hence any variety, the *tout ensemble* of which produced a pleasing effect, was cherished, without much regard to the individual points of form, colour, substance, &c. Some of the mottled, or variegated kinds, were very pretty and distinct; but I could not discover any that would stand the test to which they would be submitted by the English florist." It is, however, to the culture of Hollyhocks and to the kind of appearance they produce

in garden scenery, that we wish at present to direct attention, and on these points we find the following excellent instructions in the second edition, just published, of the little work we have already mentioned. "The Hollyhock is a capital plant for the borders of plantations or shrubbery walks: it forms a finer distant object in such situations than the Dahlia, is less lumpish, and continues blooming to a later period of the year. Again, it may be planted to advantage in the back ground of an herbaceous border, so that the lower part of the stem is hid from view by the plants in front. In both these situations it may be planted singly, in irregular lines, or in groups of three or five. And here, perhaps, the less choice kinds are more in character than the finest, as a high state of culture is neither convenient nor expected. To be effective *en masse* is all that is looked for, and the showiest should be chosen, the hardy kinds of brilliant colours, and left to assume their natural form of growth. It is sometimes said that it is not a suitable plant for small gardens. I think, however, it may be agreeably disposed there in avenues, or in groups of three or five near the boundary, filling up in front with dwarf shrubs, herbaceous, or summer-flowering plants. It appears to me anything but difficult to effect such an arrangement with this plant as shall relieve the flatness often so tiresome in small gardens. The amateur who cultivates with the view of producing the flowers or spikes in the highest state of perfection, will probably prefer planting in square beds or rows. This is convenient for shading, and places the whole under the eye at one time. If planted in beds set them 3 feet apart; if in rows 3 feet from plant to plant, and 4 feet from row to row, that one may walk conveniently between them. In regard to the soil suitable for the Hollyhock, it happily is not over fastidious in this respect. It is a gross feeder, as its fleshy porous roots and large soft leaves, with high perspiratory powers, abundantly testify. It is found to thrive well in common garden soil, although, if a choice is at hand, a rich moist loam may be preferred. I need, perhaps, scarcely say, that a situation, airy, and freely exposed to the sun, is indispensable if we wish to carry culture to the highest pitch of success. Let us suppose the beginner to have a supply of plants in October or March, and from that period let us trace their culture. First, let us ask, "Have these plants been raised from grafts, cuttings, or from seed?" Cuttings or seedlings I think preferable, where the correctness of the latter can be guaranteed by the raiser having previously bloomed them; but as some kinds only are reproduced true from seed, it is likely the stock will consist partly of plants raised from cuttings or grafts. Whether obtained in autumn or spring, they should be at once transferred from the small pots, in which they have been kept for convenience in removal, to larger ones, using a compost of turfy loam, sand, and decomposed manure, placing them in a cold pit until they may be safely planted in the open ground in May. In preparing the ground for planting, it should be dug two-spit deep. Where spring planting is intended, throw up the earth in ridges in autumn, that it may become mellowed by the winter's frost. In all cases this practice is beneficial, but it is especially so where the soil is of close texture or retentive of moisture. A good dressing of manure, not too far decomposed, may be strewed over the soil previous to ridging, and mixed in during the operation. One advantage of this is, the manure will keep the clods light, and give the sun and air a free entry; and, farther, the soil will become more evenly impregnated with the nutritious properties of the manure as they are washed down by the rain. One point, when planting, of too great importance to be overlooked, is the state of the ground. To use a common gardening phrase, the earth should "move like an ash-heap" at the time this work is done: rather would we wait a fortnight beyond the most advantageous season, than plant when the ground is wet or clammy. The plants should be set firmly in the ground 3 feet apart, not too low, pressing the soil well round the neck with the hands or by a gentle stroke of the foot. This done, watering must be attended to, if the season be dry, using weak liquid manure, breaking the surface of the ground with a hoe the day after the water is given.

Tree Carnations: *J L.* You certainly have been furnished with wrong kinds. Among tree Carnations we have scarlet and white flakes, salmon-pink striped and mottled with crimson, bright cerise, lavender mottled with white, deep rose striped with crimson, blush white mottled with rose, scarlet, purple, and large dark selfs, and white sorts mottled with rose on the edge; but we have never heard of Picotees being among them. You will find good directions for their culture at p. 23 of the current year's volume.

SEEDLINGS.

Asters: *P & Co.* All beautiful specimens, large, broad in the petal, and very double, and in every way equal to the blooms sent us last year from France.

Verbenas: *A P.* All handsome sorts, more especially General Markham, which is large and showy, and if not too strong a grower, will make an effective bed.

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—The Japan Lilies will now be coming freely into bloom, and should be neatly staked before the flowers get injured through being blown about. When removed to the conservatory they should be placed in a cool airy part of the house, shaded from bright sunshine, and liberally supplied with water, so as to preserve the beauty of the flowers as long as possible; for except they are properly cared for their beauty is apt to be but short lived. Continue to trim and regulate the growth of twiners, cutting out any shoots that have done flowering, which will tend to strengthen those left, and cause them to bloom later than would otherwise be the case. Maintain an active war against insects, and endeavour to get these thoroughly subdued before the damp cloudy weather of autumn sets in, when it will not be safe to use the engine with the same freedom as now. Also get any repairs, painting, &c., which must be done this season finished as soon as possible, for the period is fast advancing when the plants must be got into their winter quarters, and it is exceedingly inconvenient having workmen about the houses among the plants. See that Chrysanthemums are liberally supplied with water, and do not allow them to be injured for the want of staking.

FORCING DEPARTMENT.

Pineries.—Endeavour to afford plants swelling their fruit a high temperature with as little assistance from fire-heat as possible, which, as it tends to render the atmosphere dry is not conducive towards obtaining large finely swelled fruit. Therefore economise the sun's influences as much as possible, shutting up early on the afternoons of bright days after syringing the plants and moistening every available surface, and maintain a high temperature during the day, giving air sparingly. But fruit approaching maturity will be improved in flavour by a moderate use of fire-heat, a freer circulation of air, and a dry atmosphere, and where there are no means of avoiding having plants swelling their fruit and those ripening it in the same compartment, then it will be advisable to keep the atmosphere rather dry and airy while fruit is colouring, as size is of little importance unless combined with quality; but this will be best decided by employers' tastes, &c. Give careful attention to securing a fair supply of fruit for winter and spring use. Look over stock in pots frequently to make sure that it is properly supplied with water at the root, and give a liberal supply of clear strong manure-water where free vigorous growth is desired. Vineries.—Give abundance of air on all favourable opportunities where the fruit is ripening, using fire-heat rather freely when the weather is damp and cloudy, and be careful to secure a dry state of the atmosphere where the fruit is ripe and expected to hang for any length of time, using a little fire-heat when necessary to dispel damp. See that ripe fruit is secure from the depredations of wasps, if these are at all troublesome. Give every possible attention to Vines in pots intended for fruiting early next season, and endeavour to get the wood strong and thoroughly ripened as early in the autumn as possible so as to allow of giving the plants a fair season of rest. Keep Vines planted this season growing as freely as possible, and see that they are kept clear of insects, for as a house with the Vines in this stage is found very useful for growing plants, and is often used for this purpose, insects are apt to find their way off the plants upon the Vines and greatly injure them. Therefore if plants are grown under the Vines see that they are not in a state to communicate black thrips or red spider to the Vines, for unless the foliage is kept in health there will be no possibility of getting the wood well ripened, or the Vines to break strongly next season.

FLOWER GARDEN AND SHRUBBERIES.

The earliest put-in cuttings should be potted off as soon as they are sufficiently rooted to bear the operation, placing them in a close pit or frame until they get fairly established in their pots, when they should be freely exposed to the air, in order to induce short-jointed firm growth, which, with ordinary care, will be easily carried over the winter, whereas, plants got up late in autumn in a close moist atmosphere will, despite every care and attention, be largely thinned before spring. Push forward the putting in of cuttings, and get the autumn propagation out of hand as speedily as possible. Where alterations involving the removal of large trees or shrubs are in view for this autumn, the necessary arrangements for commencing them cannot be made too soon; for although large plants may be removed successfully at almost any season of the year, it can be done more cheaply, and with less risk of failure, in September than at any other period of the year.

HARDY FRUIT AND KITCHEN GARDEN.

See that the Strawberry plants for forcing are well cared for, as nothing but proper attention in preparing the plants will insure a good crop. Keep them regularly supplied with water, expose them fully to the sun, pinch off runners immediately they are perceived, and use every means to secure fine strong plants with bold crowns early in autumn, with which there will be no risk of failure next spring. Cover Morello Cherries with thin nets, to protect them from birds, without excluding the air; also, if not already done, net up some of the latest keeping Gooseberries, to afford a late supply. The Red Warrington is one of the best to hand late on the trees, and is also of good quality. Gather early Apples and Pears as they become ripe, and before the greater portion is blown down and injured. Tomatoes must be kept thin of wood, checking all shoots, and exposing the fruit to the action of the sun's rays as much as possible. Take advantage of dry days to earth up early Celery, sprinkling a good dusting of quicklime or soot about the plants in the lines, and over the surface of the ground for some distance on each side, to destroy slugs, which generally do considerable damage to Celery, especially in wet seasons. The soot or lime should be applied two or three times before soiling up the plants, at intervals of a few days, and early in the morning, before the pests have retired to their hiding-places. Take up and dry Onions that have completed their growth.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Aug. 30, 1855, as observed at the Horticultural Gardens.

Satur.	8	68.0	48.2	58.1	12	0.65	3	6	2	2	3	9	2	1

The highest temperature during the above period occurred on the 3d, 1835, 5th, 1818, and 7th, 1843, and 1846—therm. 83 deg.; and the lowest on the 4th and 6th, 1810—therm. 30 deg.

Notices to Correspondents.

Apricot Tree: *H O P.* There can be little doubt that in your case drought at the root is the cause of failure.‡

Araucaria: *B B.* If you cut a very narrow circular trench round the plant now, at about 3 feet from the stem, and fill the earth in again, you will be able to move the plant in October.

Books: *E P.* Don's "Hortus Cantabridgensis," or Loudon's "Hortus Britannicus," and for the "poor man" Paxton's "Cottagers' Calendar."

Brandy Cherries: *J W B.* Cut the stalks half off. Do not prick them. Fill a wide-mouthed bottle with them; then fill the bottle up with brandy. Use no sugar. Cork the bottle well, or tie the mouth over with a bladder, and store them where you like. A wine cellar is a good place.

Deodorizers: *F.* The Nettle a deodorizer! who says so?

Diseases: *H R M.* A further examination of the Justicia leaves which you have kindly forwarded shows a number of subglobose semitransparent bodies, consisting of a membrane filled with oily matter and a few granules. From the interior of this membrane creeping threads with short patent branches are produced, ultimately assuming the form of a Sporotrichum. The primary disease consists of the globules, but the mould which springs from them may ultimately produce mischief by appropriating the matter contained in the tissue of the leaf. Sulphur would probably destroy the mould, but it would have no effect upon the other bodies. *M. J. B.*

Insects: *W Y.* Your insects taken from the Pyrus Sorbus prove to be, not the Leopard, but the Goat-moth, Cossus ligniperda. See *Gard. Chron.*, 1847, p. 303, for figure and description.—*J A.* The leech-like insects on the leaves of your Cherry trees are the slimy larvæ of the black-winged Sawfly, Tenthredo (Blennocampa) Æthiops. See *Gard. Chron.*, 1842, p. 692, for figure and description. The most effectual method of destruction is to dust the leaves and grubs with lime, or syringe them with lime-water, which instantly kills them.—*J R.* The pest on your Pear trees is the same species of insect which attacks the Cherry leaves. See the last answer. *W.*

Legal Questions: *A Sub.* We are obliged to object to such inquiries. It is understood that you cannot remove shrubs and trees at the end of your tenancy, unless there is some special covenant in your lease.

Names of Fruits: *E Pike.* 1, Orange d'Eté; 3, Passe Madeleine; 4, Green Chisel.—*J E X.* The Diamond Plum, large, black, and very coarse.

Names of Plants: We have been so often obliged to reluctantly decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have or could have undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 1367, Puschkinia scilloides; 302, Gladiolus Byzantinus; 13, Tulipa persica? 1358, Iris iberica; 1291, Fritillaria tulipifolia; 155 and 155 A are undoubtedly the same; 173, Anemone albana; 1365, Eremurus spectabilis; 1347, Delphinium ochroleucum; 124, Campanula Steveni, a dwarf state with scabrous ovary.—*F H S.* Nos. 1 and 2 are the same species of Epidendrum; but we do not recognise it unless it be E. bidentatum. The other plant is Acropera Loddigesi.—*G W.* The red flower is Humea elegans, a handsome ornament of out-door gardens in summer; but impatient of cold. The other we do not remember, and must examine at leisure. Where does it come from? We will notice it again next week. The Humea is too large for a window greenhouse. *J.* A variety (very slight) of Lythrum Salicaria and Palmella cruenta.

Potato Disease. We have to thank several correspondents for communications concerning the spread of this malady, or for speculations as to the cause. The first we hear of with much regret: with the latter the public has been surfeited. If we should be so fortunate as to find anything which is at the same time *both new and true*, we shall not fail to make it known.

Raspberry Plants: *Barton.* We are quite unable to form any opinion concerning your method—not having been informed what it is.

Russian Mats: *R G F* will be obliged by some of our correspondents informing him what they have found to be the best substitute for Russian mats.‡

The Hare's-foot Fern: *M A W.* This is named Davallia canariensis. It is named in allusion to the resemblance between its creeping curved hairy rhizome and a hare's foot. A similar comparison has led to the fable of the Barometz, Baranetz, or Scythian Lamb, for which see Darwin.

Yeast: *Lucy Gray* will be obliged by our correspondent who in last Number gave a recipe for making yeast stating how much is required of the yeast for 4 lbs. of flour, and if it is necessary to mix it the night before it is made into loaves.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent. of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

THE LONDON MANURE COMPANY'S NITRO-PHOSPHATE OR WHEAT MANURE FOR AUTUMN SOWING.—This Manure, composed of blood, animal matter, and dissolved bones with silicates, is most strongly recommended to the notice of Agriculturists. It contains from 7 to 8 per cent. of nitrogen, in a form yielding ammonia by slow decomposition, and is therefore particularly adapted for Wheat. The quantity required is 2 to 3 cwt. per acre drilled in with the seed. Price, per ton, 7*l.* 10*s.* in London.

PERUVIAN GUANO, FISHERY SALT, and every other MANURE on best terms, strictly warranted.

40, Bridge Street, Blackfriars. E. PURSER, Sec.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch. Gentlemen desirous of receiving instructions in Chemical Analyses and Assaying, will find ample facility and accommodation at the College.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL and GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

DRAINAGE OF LAND.
